# THE IRON AGE

THURSDAY, APRIL 4, 1889.

## Universal and Automatic Milling Machine.

In those registering machines that employ a train of so-called clock-gearing to transmit motion from the driver to the hands of the dials it is most essential to have the gears run with as little friction

ting the gears and pinions used in that meter. It was necessary to have a machine the accuracy of whose work could be relied upon, and which would be rapid in operation and durable. An uninterrupted use of one of these machines for over seven years shows that it possesses these features in a marked degree. It has

has three changes of feed; the feed-cone B has two changes and drives the larger cone C. Motion is transmitted from the shaft of the cone C through a universal joint-connection, D, to the devices operating the table and dividing mechanism. On the shaft E is a clutch which engages alternately with a forward and backward

UNIVERSAL AND AUTOMATIC MILLING MACHINE.

as possible, and at the same time to fit so that lost motion will either be done away with entirely or reduced to a minimum. This is especially the case in those machines in which the power available for driving the mechanism is small. Recognizing these facts, the milling machine of which we herewith present a perspective and sectional drawing was designed by L. H. Nash, inventor of the Crown water-meter, solely for the purpose of cut-

cut at the rate of over 100,000 gears a year, and its repair account has been insignificant.

So self-explanatory are the drawings that a detailed description of the machine is not needed to enable one to understand its construction and operation; we will, therefore, merely mention the more prominent features. The driving shaft is provided at either end with a taper bearing for taking up wear. The driving-cone A

train of gearing, the speeds being in the ratio of  $4\frac{1}{2}$  to 1. The shaft immediately above and parallel with the shaft E performs two operations, one of which is the driving of the table through beveled gears actuating the table screw L, which can be disengaged from the gearing or brought into operation by a friction clutch shown at P, and of the form commonly used in the feed mechanism of a lathe. The second operation performed by the intermediate

shaft consists in driving the automatic dividing mechanism carried by the shaft F, which is driven in either direction by the gear G, which is mounted loosely upon a sleeve, and is provided at each side with a leather friction clutch. On the sleeve is an arm, carrying a pawl, adapted to engage with the ratchet-wheel I, mounted on the shaft F, which has its bearing in a hollow shaft, and is formed with a worm at its inner end. The sleeve above mentioned has a threaded bearing, so that at each revolution it advances or recedes the space of one thread. The movement of the sleeve and its pawl-carrying arm is controlled by two stops, one of which regulates the number of complete

tember next. The opening day will be September 4, at 8 p.m., and closing day on October 19, at 11 p.m. The programme of opening exercises is given in full, together with the rules and regulations to be observed in all of the departments.

#### The Coke Trade.

A recent trip through a portion of the Connellsville coke regions by a representative of *The Iron Age* disclosed the fact that the condition of this industry at the present time is very unsatisfactory to the operators, both as regards orders received and prices obtained. While it is true that

ators in the region have stated that they are unable to meet present low prices and make any money, and have closed down their works as a consequence. A reduction in the wages of the coke-workers has been broached, and in all probability will be made during this month. As is well known, the present scale of wages is based on coke at \$1.25 per ton, and the operators say that it is impossible to pay these wages when coke is selling at a considerable reduction on this figure. A few months ago the H. C. Frick Coke Company, which firm controls more ovens than any other in the region, signed a scale of wages for one year based on coke at \$1.35 per ton, with the provision that unless a similar

SECTIONAL SIDE ELEVATION OF UNIVERSAL AND AUTOMATIC MILLING MACHINE.

revolutions, while the other regulates the fractional parts of a revolution. This action controls the movement of the shaft F, whose worm moves the spindle carrying the blanks being cut. The index-plates or ratchet-wheels mounted on the shaft F correspond with the dividing wheel on the universal milling machine and control the arc through which the blocks are moved.

The apparatus for reversing the clutch and holding the blanks present points of decided novelty and great value. We are indebted for the privilege of publishing engravings of this machine, which was designed solely for private use, and which has not been patented, to the kind courtesy of Mr. Nash and to the National Meter Company, of this city.

The Pittsburgh Exhibition Society have issued their prospectus for the first annual exhibition, to be held in that city in Sep-

shipments during the month of March were slightly in excess of those for the previous month of February, still the demand at the present time is far short of the productive capacity of the region. This statement will be borne out when it is known that fully three-fourths of the ovens in the region are idle on Wednesday and Saturday of each week. Notwithstanding this attempt to curtail production, the amount of coke on hand awaiting shipment is constantly increasing, and unless an improved demand springs up in the near future a shut-down of a considerable number of ovens is inevitable. This condition of affairs has not been without its effect on prices. While the published price of coke to furnace operators has been given as \$1.25 per ton, sales have been made in Pittsburgh within the last few days for future delivery at \$1.10 per ton, and it is hinted that bottom prices have not yet been reached. A few small oper-

scale was signed by the other operators by April 1 the scale was to be revoked. This has not been done, and, as we have already stated, the other operators will very likely insist on a lower scale than the one now in force. As yet neither the H. C. Frick Coke Company nor their employees have made any move in the matter of preparing a new scale, and it is thought the balance of the operators are waiting to see what action will be taken by this concern.

The United States has issued these new regulations for marine boilers: Any boiler having been in use ten years or more shall at each annual inspection thereafter be drilled at points near the water-line and at the bottom of the shell of the boiler, or such other points as the local inspectors may direct, to determine the thickness of such material at those points, and the general conditions of such boiler or boilers at the time of such inspection, and

the thickness of such material shall be determined thereafter at each annual inspection, and the steam pressure allowed shall be governed by such ascertained thickness and general condition of the boiler.

#### Grouped Rates.

The Interstate Commerce Commission, in an opinion by Commissioner Schoonmaker, has decided the case of the Imperial Coal Company and others against the Pittsburgh and Lake Erie and another. The points are as follows: The rate on transportation of coal to points on Lake Erie has been grouped since April 1, 1887,

in reaching a common market among themselves and with competitors from another territory, is not unlawful unless it results in actual undue prejudice to producers nearest the market. The question of undue prejudice is one of fact to be determined upon all the evidence, including the character of the mines, the quality of the coal, the expense of reduction, the extent and nature of the competition, the public interests arising from the use of the commodity, and not merely by the fact of distance. On the facts of this case, which involves only the question of discrimination between the complainants' mines and the more distant mines in respect to lake shipments, it does not appear that the complainants are subjected to

very dangerous and requires the closest attention, and therefore the wages paid them are quite high. Besides this, the least neglect on their part is apt to cause the kinking of the rod, and when this happens the delay in its passage through the mill chills the metal and unfits it for use, necessitating the cutting of it into pieces for scrap.

Henry Roberts, of Pittsburgh, Pa., has patented, under date of November 6, 1888, a simple and effective method of diminishing the evil alluded to. We understand that it has been successfully introduced at a number of rod mills. It consists in placing over the inclined guide-floor an elevated horizontal platform or floor. The wire loop travels on the in-

FRONT ELEVATION OF UNIVERSAL AND AUTOMATIC MILLING MACHINE.

for a considerable district in Western Pennsylvania, of which Pittsburgh is the center. The district has a radius of 40 miles around Pittsburgh. The group rate on coal is 90 cents a ton from all the mines and by all the lines of railroad that carry to the lake. The coal from the Pittsburgh district is in competition at the lake with coal from the Hocking Valley district, in Ohio, where the coal rate is also grouped at 85 cents a ton. The complainants' mines are near the center of the Pittsburgh district, and some mines within the radius are nearer the lake and others are more distant, varying from a few miles to 43 miles. On complaint for unjust discrimination against the complainants and undue preference to the more distant mines, it is held that a group rate to put producers of coal of the same general character and of practically like cost of production in a given territory on a footing of equality

undue prejudice, or that the more distant mines are given an unreasonable preference by the uniform rate.

#### The Roberts Wire-Rod Mill Floor.

In rolling metal rods in a mill as now commonly practiced it is customary to employ a series of trains of rolls set in line with each other and to pass the metal back and forth between these rolls. As the metal is reduced in diameter and increased in length there is always difficulty in controlling it and preventing it from kinking, especially so when it is attempted to roll more than one rod at a time in a single mill. For this purpose it has been usual to employ boys, who stand with hooks opposite to the rolls and guide the elongating metal loop, with a view of preventing it from kinking or injuring the workmen. The work of these boys is

clined floor below, and this leaves the horizontal floor unobstructed for the ordinary operations of the mill, the workmen being enabled to walk thereon in comparative security. It also consists in providing the floor of the mill with a projection or stop having a curved end, over which the metal loop passes and around which it is drawn by the action of the rolls. The effect of this projection is to straighten the metal rod and to remove from it kinks or bends, and to compel the rod to travel in a regular course from one pair of rolls to the next.

The 30th of April is a legal holiday throughout the Union in accordance with the last section of an act approved March 2, 1889, to commemorate the centennial observance of the inauguration of the first President of the United States, George Washington.

### The Tangye Gas Hammer.

It is claimed that with this hammer over 2500 of the heaviest blows can be given with the consumption of four cents' worth of gas at \$1.25 per 1000 feet, each blow being equal to that which would be given by a weight of 335 pounds falling one foot, and that it can be repeated at the rate of 120 blows per minute. Fig. 1 of the engravings is a perspective view showing the hammer fitted with a treadle to be operated by the foot; in Fig. 2 it is operated by hand; Fig. 3 is a rear view of the hammer.

The charging piston A is shown in its highest position near the top of the

the gases to pass through them, thus equalizing the pressure upon both sides of the piston. After the delivery of the blow the charging piston is forced down by the lever X, and as soon as it has descended far enough to uncover the exhaust port R the gases escape through the valves I I and the exhaust port R, until the pressure is reduced to that of the atmosphere. The same movement allows the igniter bolt to shut off communication with the flame. As soon as the pressure is sufficiently reduced, the volute springs G raise the piston D and the hammer in the position shown, this upward movement being arrested by buffer springs and leather collars at Y. Now, the downward

which it is desired to deliver, precisely like the hand lever commonly used in steam hammers for controlling the slide valve; the similar movement produces precisely similar results and the effort required to move it is no greater. A boy can work the gas hammer just as easily as a steam hammer. In cases where it is desired to strike very light blows, a relief valve is provided, which allows part of the pressure to escape; this valve being operated by the lever L in the hand machine, or in the treadle machine it may be operated at will, by the same motion of the foot which works the hammer. This is accomplished by fixing the plates for the foot at the ends of a cross bar, which is

Fig. 1

Fig. 2.

Fig. 3.

TANGYE GAS HAMMER, Mccoy & SANDERS, AGENTS.

cylinder, and between this and the main piston D the explosive mixture is drawn in and ignited. In operating the hammer the hand lever X is moved from the position 0 to position 5; this motion is, by means of the rod L and the lever K, transferred to the charging piston A, raising it to its highest position. This charging piston in its upward movement expels all gases above it by means of the exhaust passage R, until, when its highest position is reached, this part is covered by the piston. The same movement draws in between the pistons the mixture of gas and air ready for an explosion, and at the proper time a roller on the rod L lifts the igniter bolt, uncovering a Bunsen flame and firing the charge. The force of the explosion and the continued expansion of the gases drive the piston D downward until the blow is delivered. The force of the explosion does come against the charging piston A, because in it there are two valves I I opening upward, which allow

motion of the charging piston being continued until it is near the piston D, it is again raised to the position shown, and another blow delivered. This describes the operation of obtaining blows of maximum force at the rate of 120 per minute.

Now, it is evident that the charging piston with its valves I I is identically the same in its action as the plunger of an ordinary lifting pump, and that if it is brought down by the movement of the lever X quite close to the piston D, and then raised to its highest point, the space between the pistons will be filled with the explosive mixture; but if it be made to descend only part way and then raised, only as much of the explosive will be drawn in as is equal in volume to the displacement of this shorter stroke, and the force of the blow is therefore proportionally reduced. Thus, for producing heavy blows the hand lever X is always raised to position 5, but is depressed to position 4, 3 or 2, according to the force of the blow

swiveled to the lever in such a way that it may be swung around by the foot, so that in its descent it comes in contact with the relief-valve lever, shown at the side of the machine, Fig. 1. The piston D is forged solid with the piston-rod.

The employment of a gaseous explosion for the development of power has, by the increasing use of gas engines, been made familiar to mechanics, but this machine embodies a comparatively new application of the principle. In general appearance and in the method of handling this gas hammer is much the same as the steam hammer, and was originally designed to be used in places where steam was not easily available. This hammer is ready for work at any moment, and it will work as economically for a few minutes as when in sustained operation. Compared with power hammers driven by belt from the very best type of gas engines, it is claimed that this hammer is superior in point of economy, for while forging it uses very

much less gas than the engine, and none whatever while standing; whereas the gas engine must be kept running continuously, although the power-hammer driven by it is only being worked intermittently.

The hammer weighs 2700 pounds and will forge shafts 2 inches in diameter. The extreme dimensions are: Floor space, 3 x 2 feet; height over all, 7½ feet. It is stated that for the past 12 months one of these hammers has been almost continuously employed in the regular work of the smith, doing the very hardest kind of work, which it has done thoroughly well. The sole agents for this hammer in the United States are McCoy & Sanders, of 26 Warren street, New York.

### The New Torpedo-Boat.

The work on the new torpedo-boat for the navy is fast nearing completion, and the Herreshoffs expect to have it ready for trial during the coming May. Its hull is all in place, and the turtle-back-shaped deck is finished except the fitting of a few more steel plates. The starboard engine is practically finished, and as it stands erected in the shops of the company it is a handsome specimen of workmanship. Alongside of it is the port engine in process of erection. This engine is about half finished. Both engines will be erected in the torpedo-vessel before the latter is launched. When this event takes place, only a few days will be required by the Herreshoffs to get the boat ready for the speed test. The shafts have not yet arrived from the Midvale works neither are the two screws on hand. The Herreshoffs say that they are not to make the torpedo tubes. The probability is that these will be fitted to the vessel after she goes into commission at one of the navy yards.

The United States Government demands that this vessel shall make 20 knots an hour on the official trial. At the same time that the contract was signed the Herreshoffs estimated the boat's speed for the trial run at 23 knots an hour. Knowing, as naval officers do, how careful these contractors are not to give out too great hopes, it is confidently believed that this new torpedo-boat will prove as great a wonder as did the Vesuvius. The design for the vessel originated, in a crude form, with the Navy Department, the contractors having left to them the development of much of the detail, though all ideas and newly-conceived plans on the part of the latter have had to be submitted to and approved first by the department before they were authorized.

The new torpedo-boat is 137 feet in length, has a beam of 14 feet and 6 inches, and a depth of hold of 8 feet. Its draft will be 3 feet and 7 inches. As it will lie in the water it will present only 3 feet of freeboard along its whole hull, save at the forward part, where the whale-back deck will have a rise of some 5 feet from the water's edge. The length of this whale-back deck, which runs from the stem aft, cannot be over 20 feet. Just at its break is erected the forward conning tower, which will project above the whale-back. It will be a wet place when the torpedo-boat is driving full speed into seaway. The chances are that the long, low craft will go right through the seas like a swordfish, without waiting to mount the waves. Under the whale-back will be mounted the torpedo tubes, two in number, their forward ends projecting through each bow a few feet forward of its "bluff" on each side. The tubes will of course be loaded with the torpedoes at the breech, the working being down right at the conning tower. The magazine is under the whale-back deck, and will contain three torpedo stores. The after conning tower sets up about one-third the

length of the vessel from the stem, the communication with the forward one having to be made by running over the top of the turtle-back main deck. Two life-lines will be set fore and aft, leaving just space enough between them to permit of one passing and holding on.

The boilers for the vessel are to be mounted fore and aft. There will be two boilers, and consequently two engine-rooms, each boiler having three furnaces. The engines will be directly opposite each other, and it goes without saying that it will be little else than a squeeze in passing between them. The weight of the machinery is specified not to exceed 47 tons, and the displacement of the vessel with all her machinery, armament, boilers, water in boilers, and coal in bunkers, crew and stores, must not exceed 99 tons. When it is taken into consideration that the average horse-power ascribed to a vessel is two per ton of displacement, and that only three and four are given where great speed is demanded, the horse-power of the engines for the torpedo-boat might readily be placed at 300 or 400; but the Herreshoffs are actually giving 1500 horse-power to this frail, light craft. The boat's speed must certainly be tremendous.

The engines of the torpedo-vessels have each five cylinders, measuring respectively 11½, 16, 22½, 22½, 22½ inches in diameter. The shafts are 5½ inches in diameter. They are of solid steel, and are the work of the Midvale works of Philadelphia. The coal capacity of the little vessel will be about 25 tons, according to Mr. J. B. Herreshoff. There will be little chance to wedge in an extra ton or so. But, then, as the torpedo-boat will be wanted for coast service it need give little concern to the question of how far she can run without recoaling.

The contract price to be paid by the Government for the new torpedo-boat is \$82,750, the requirements being that she show on trial a speed of 20 knots an hour. The coming July ought to see her on the active list and in commission. She is to carry a secondary battery of two 6-pounder rapid-fire guns, presumably to be mounted somewhere on her turtle back. The only vessels the little craft can expect a hostile attack from by way of a surprise will be from hostile torpedo-vessels or the enemy's small boats sent out to board her. Against such attacks Gatling guns would prove of little use except to clear the way of small boats. But against the sides of the attacking torpedo-vessels their fire would be futile. It is here that rapid-fire guns will play a prominent part and be the only means of saving the vessel. The same reasoning has been applied to the arming of the Vesuvius with a secondary battery as was in the case of the torpedo-vessel.

The best type of the Puget Sound saw-mill is unquestionably the big mill at Port Blakely, built within the last year. It contains two rotaries, two pony rotaries and two Wilkin gangs, all driven by four engines located under the sawing floor. The mill is 430 feet long, provided with live rolls, Hill niggers, rope feeds and Cunningham twin engines, hydraulic lifts, tracks for readily getting the lumber away by cars, automatic sprinklers and the best of fire protection. As in most of the mills, the planing machinery is located on the floor underneath the main sawing floor. As in all the mills, also, the circular saws are swaged so that they are a full half inch in thickness, and take out at every cut just that amount of saw-dust. According to computation a fraction more than one-fifth of all their raw material goes into saw-dust and shavings, and they daily burn in the open fire across the bay, where it is carried with the aid of a blower, fully 15 tons of saw-dust.

### Machined Car-Wheels.

Notwithstanding the improvements made in the manufacture of chilled wheels, there remains an apparent necessity for finishing them by some method of grinding. Even those made in the contracting chill are turned out with the tread covered with small ridges, which, while not seriously objectionable, must increase the resistance of the train and the abrasion of the rail. These objections have not been considered serious enough to warrant the expense of grinding the wheels by ordinary methods, but makers have considered and are considering now the possibility of introducing machinery that shall turn out wheels free from this defect. For wheels made in the non-contracting chill, the importance of grinding is much greater. They cannot approach so near to absolute roundness and perfect balance as do the wheels made by the more improved method. Some years ago machinery was introduced for truing the chilled wheel, but the work could not be done as economically or rapidly as was necessary to admit of such wheels coming into general use; besides, the wheels so trued were finished after having been pressed on the axles, and as few consumers buy in this manner, the use of such wheels did not become general.

The New York Car Wheel Works, of Buffalo, N. Y., have been engaged for the past two years in building machinery and fitting up a plant for doing the work necessary to turn out wheels perfect in the above respect. The wheels are first bored, then turned true on the tread and balanced. The machinery for doing this work is of entirely new design, and capable of rapid and economical working. One machine will turn out 40 finished wheels per day. This brings the use of wheels mechanically perfect within the possibilities for every kind of service. Of the great desirability of having wheels perfectly round and balanced there is no question. Cars will ride smoother and haul easier; the wear on the track and bridges will be less and the life of the wheels increased. The company are now manufacturing cast wheels in diameters 36-inch, 40-inch and 42-inch, the 36-inch weighing 750 pounds, the 40-inch, 850 pounds, and the 42-inch, 900 pounds. The use of cast-iron wheels of large diameters has not been looked upon favorably heretofore, doubtless because they could not be made mechanically perfect. If these large diameters can be turned out as accurate in form as steel tires and as cheap as good ordinary chilled steel wheels their use will probably extend. The wheels made by the New York Car Wheel Works are designated as "machined" car-wheels, and a guarantee is given that all wheels sold will be true to ¼ inch and balanced to an average of 2½ pounds; no wheel to exceed 5 pounds, out of balance. The same company furnish brake shoes, truing them on the face, so that perfect contact is secured when the brakes are applied, and the wear of the shoes having been commenced in a proper manner, continues in the same way until they are worn out.

Provisional returns of the mineral production of France in 1888 fix the output of coal, including anthracite and lignite, at 22,954,940 tons, an increase of 1,664,351 tons on 1887. The production of pig iron rose from 1,806,930 tons to 1,688,976 tons; of wrought iron, from 771,610 tons to 833,839 tons, including 598 tons of iron rails in 1887, and 538 tons in 1889. Steel increased from 493,294 tons to 535,646 tons. There was a decrease of 27,311 tons in steel rails compared with 1887, but an increase of 46,568 tons in merchant steel, and of 13,095 tons in plates.

**Double-Column Milling Machine.**

There are few machines in which rigidity plays so important a part as in the milling machine. The nearer it approaches to absolute firmness the more accurate will

file, ground and polish, and thus gradually lead up to the delicate operation of adjustment. A diploma will be granted after proficiency has been attained. There will be lectures, constant supervision and regular systematic instruction. Several

be converted as desired. It is stated that the company are at present making hatchets, axes, adzes, hoes, shears, &c. The company contemplate building another factory this year, and will also manufacture in Canada to save the patent there. The tests will be complete in several weeks.

THE GRANT DOUBLE-COLUMN MILLING MACHINE.

be the work done by it. The accompanying engraving illustrates a machine in which this feature is carefully considered, and in which a degree of stiffness has been obtained far beyond the usual construction. The machine was designed by John J. Grant and is manufactured by the Pratt & Whitney Company, of Hartford, Conn. Cast solid with the base are two columns, on the inner faces of which sliding surfaces are formed, and to both of which the elevating block is fitted and to which it may be clamped when in use. The inherent stiffness of the columns is thus increased, since they are rigidly clamped together as near the top as the height of the work will allow. The machine is simple in construction and all its movements are effected by handles placed within convenient reach. The vertical and horizontal adjustments of the table can be minutely varied by means of graduations to the thousandths of an inch. The machine is geared in the ratio of 9 to 1. The largest step of the cone is  $10\frac{1}{2}$  inches in diameter, the belt being  $2\frac{1}{2}$  inches. The front bearing of the headstock spindle is 3 inches in diameter and 5 inches long, the thread on the end being  $2\frac{1}{2}$  inches in diameter. The greatest distance between the head and tail stock spindles is 16 inches, and between the top of the table, when lowered, and the center of the spindle,  $12\frac{1}{2}$  inches. The travel of the table is 16 inches; width of saddle,  $18\frac{1}{2}$  inches; horizontal adjustment on slide,  $7\frac{1}{2}$  inches. The machine has 12 changes of feed, eight speed changes and automatic screw feed with stop-motion. The weight of the machine is 2000 pounds.

The latest industrial venture established in Pittsburgh is a school for watch making, which has just been opened in that city under the direction of L. L. Keller. The school contains ten desks, fully equipped with the requirements of the trade. Cabinets, heaters for drying watches and adjusters for heat, cold, isochronism and position are all in readiness. In an interview regarding his venture, Mr. Keller states that in his opinion Pittsburgh is large enough to support a horological school, and should have had one before this. There are but few horological schools in the country, the nearest one to that city being located in Chicago. He will first teach students how to handle tools, then how to

prominent gentlemen have expressed themselves as interested in the school.

A correspondent reports that the Falls City Malleable Iron and Steel Company, of

**Diamond Punch and Die Grinder.**

The machine herewith illustrated is one of the late improvements in grinding machinery brought out by the Diamond Machine Company, of Providence, R. I., and is designed for grinding and finishing punches and dies, or any hardened cylindrical surfaces; also for squaring and smoothing up any metal pieces having flat, concave, or convex surfaces to be finished, and which can be held in a chuck or on a face plate.

The machine has two spindles at right angles to each other, in the same horizontal plane; one carries the chuck and the other the cutting-wheel. The chuck spindle, which is  $1\frac{1}{2}$  inches in diameter in the boxes, and will carry a chuck up to 10 inches in diameter, runs in a head bolted rigidly to the column, and has a cone pulley for a  $2\frac{1}{2}$ -inch belt, giving two changes of speed. The emery-wheel spindle, which is  $1\frac{1}{4}$  inches in the boxes and 1 inch between flanges, and will take wheels up to 12 inches in diameter, runs in a head which has a horizontal movement of 3 inches and a lateral movement of  $4\frac{1}{2}$  inches, both of which are effected by hand. This spindle is also adjustable about a central pivot. The grinder is provided with a patent dust-excluding device, and is substantially built throughout. It weighs, complete

DIAMOND PUNCH AND DIE GRINDER.

Louisville, Ky., are making edged-tools by the Harper-Clark process. The process requires the casting of the tool in even thickness throughout and annealing it to a certain point. It is claimed that the process eliminates the cost of forging entirely and permits any part of the too to

with the countershaft, 850 pounds. The floor space occupied is 25 x 25 inches, and the height from floor to center of spindle is 41 inches. Further particulars can be obtained from the home office as above, or from the Chicago office, 51 South Canal street.

## Lathe and Planer Tools.

**Tool-Grinding Machine and Tools  
Used at the Works of William  
Sellers & Co.**

All the lathe and planer tools used at the works of William Sellers & Co., of Philadelphia, are made according to an extremely simple and effective system, which is really the interchangeable idea applied

he may need an unusual form. The tools made and kept in stock are of such diversified shapes as to apply to all regular jobs; but when a new form is imperatively needed the foreman is notified, a drawing is made showing its shape, and then it is forged and ground.

The grinding machine is intended for shaping and dressing hardened tools to the most complicated shapes, by means of a grinding wheel of peculiar form of face, acting in connection with chucks, slide-rests and former plates to hold and direct

iron cover. A rotary pump forces water to the tool being ground through a system of pipe, the nozzle of discharge being made to hold the same relation to the tool in motion as at rest. Slide-rests, adjustable in angle by means of graduated arcs and verniers, have vertical, horizontal and rotary motion, moving the tool in all directions in front of grinding-wheel so as to grind its several faces at one setting to any angle of clearance or top rake. The machine is furnished with former plates for grinding all the forms of roughing tools which have been found to be most useful at the Sellers works, and means are provided to enable new former plates to be originated from a sample tool made by hand. The machine is provided with a chuck for circular or round-nose tools, which is also used in connection with former plates furnished to grind curved-face roughing tools, right or left hand, and at any angle; a holder to be used in grinding the side or base of the shank of the tool; a chuck by means of which any bent tool can be ground on all its faces without changing its position in the chuck; a chuck to hold splining or key-seating tools in the same manner, and a crane for lifting the heavy wheel cover, changing the wheel on its spindle, or lifting the chucks.

Accompanying the machine are diagrams upon which are figured 56 different kinds of plain-face tools, showing all the angles and the position of the chuck that holds them; also nine different shapes of either right or left hand tools, covering seven sizes of each from  $\frac{1}{4}$  inch to 2 inches, indicating the former plate to be used in each case, and also a table of circular tools which the machine grinds perfectly without the use of former plates, and which embraces all sizes from  $\frac{1}{4}$  inch to  $2\frac{1}{2}$  inches

TOOL-GRINDING MACHINE, BUILT BY WILLIAM SELLERS & COMPANY.

to tools of this description, since all the tools of the same kind are alike in every essential characteristic. Tools in the rough are taken from the blacksmith shop to the patent tool-grinding machine built by the company, where each is ground in accordance with certain rules controlling its desired form. The finished tool then passes to the tool room, from which it is delivered to the men. This method insures uniformity of the tools themselves and tends most materially to enhance the quality of the work they do—when the latter is considered as a whole—and it also results in the saving of much time, as it is against the rule for a machinist to grind his own tools, no matter for what purpose

the motion of the tool while it is being shaped. All ordinary tools used in lathes, planers and all other machine tools, the cutting edges of which are bounded by planes, or planes and convexed-curved surfaces, are ground to shape from the rough forging with ease and dispatch, irrespective of the position the cutting edges stand in relation to the body of the tool. The grinding-wheel is of coarse structure, but from the direction of its cut it grinds both quickly and fine. It is mounted on a box frame, part of which serves as a tank to hold the water used in flooding the tool to keep it cool. This tool can be reversed face about on its spindle to equalize the wear, while it is inclosed in a massive cast-

Circular Tool.

diameter of circle. These tools, of which we herewith present the outline and give the clearance angles, are those used in the Sellers shops, and they may be said to represent the outcome of years of experience and to be the best form of fixed tools to enable machine tools to work to the best advantage.

The diagrams give, in addition to a plan outline of the tool and angle of clearance of its sides, both of which we herewith reproduce, the horizontal angle on the grinding machine, and also the vertical angle. To illustrate, the diagram gives, in the case of the "finishing wrought-iron" lathe tool, a drawing of the tool, the angles of clearance of the sides  $a, b, c, d$  (both of which we reproduce), the horizontal angle on the grinding machine for each of the sides,  $a=90^\circ, b=90^\circ$ , and  $c=80^\circ$  and top  $d=110^\circ$ , and the vertical angle on the grinding machine,  $a=356^\circ, b=184^\circ$  and  $c=90^\circ$  and top  $d=95^\circ$ . These directions embody all that is needed to enable one to grind a tool to the required form. Directions are given for grinding circular tools having diameters of  $\frac{1}{4}$  to  $2\frac{1}{2}$  inches by sixteenths.

Witherbees, Sherman & Co., of Port Henry, N. Y., miners and shippers of Lake Champlain ores, announce that they have discontinued their Western sales agency, formerly conducted by M. A. Hanna & Co., of Cleveland, and ask that inquiries and orders be addressed to the main office at Port Henry, or the branch office at 46 Wall street. Their representative, G. B. Wilkinson, will visit Western consumers at an early date.

## CURVED-FACE TOOLS.

*Lathe.**Planer.*

The sizes (*a*) of all of the above tools are as follows :  $\frac{1}{2}$ ,  $\frac{3}{8}$ ,  $\frac{1}{4}$ , 1,  $1\frac{1}{4}$ ,  $1\frac{1}{2}$ , 2 inches.

### Andrew Carnegie to His Workmen.

On the 30th ult. Andrew Carnegie, of Pittsburgh, spoke at length to the workmen at the Edgar Thomson Steel Works, the occasion being the presentation of the Carnegie Free Library, at Braddock. We quote from his remarks those passages which are of more than local or personal interest:

When articles were manufactured in small shops by employers who required only the assistance of a few men and apprentices, the employer had opportunities to know all, to become well acquainted with each and to know his merits. On the other hand, the workman, brought into closer contact with the employer, inevitably knew more of his business. More important than all, they came to know something of the man himself. This is changed. To make without loss a ton of steel rails and load them upon the car for a small fraction more than 1 cent per pound—4 pounds for a nickel—we must have thousands of miners, whom it is impracticable for a partner to see, and hundreds of blast furnace men, and in the converting works and steel-rail mills, only a few of whom it is possible for the employer to know.

Thus the employees become more like human machines to the employer, and the employer becomes almost a myth to his men. This is most regrettable; yet I see no remedy. Economic laws force the manufacture of all articles of general consumption into the hands of a few enormous concerns, that their cost to the consumer may be less. The manufacture of such articles cannot be conducted upon a small scale; works costing millions are required, as the amount per ton or per yard of "fixed charges" is so great in the total cost that, whether a concern can run or not in many cases depends upon whether it divides these fixed charges—which are practically the same in a large establishment as in a small—whether we can divide them by 1000 tons per day or by 500 tons per day of product.

A feeling of mutuality and partnership between the employer and the employed is desirable. Believe me, the interests of capital and labor are one. Mr. Carnegie now proceeded to show the fairness and advantages of

THE SLIDING SCALE SYSTEM OF WAGES, such as prevails at Braddock. He went on to say: You are no longer only employees; you are also sharers with us in the profits of our business, and, sooner than return to the old plan by which capital and labor were antagonized, and we had to quarrel every year upon the subject of wages, speaking for myself, I would retire from business altogether. As far as I am concerned, I will never again have anything to do with manufacturing unless labor is given a sliding scale. The coke-workers were exactly right in their recent demand for a sliding scale. You know that the Frick Coke Company, in which our firm is interested, have always favored complying with the request of the men for a sliding scale, and spent beyond \$100,000 last year to maintain a higher scale than competitors. Unfortunately the fall in the prices of coke has rendered further effort useless. The iron and steel business being dull and profitless, that of coke sympathizes, but I rejoice that the sliding scale is to be maintained, although we are driven by competition to pay the uniform scale of the district.

If you have read the newspapers, you will know that out of 13 mills engaged in the manufacture of steel rails in this country not more than three are running to their capacity. Only one mill in all the West is making rails (North Chicago), and I am sorry to say that even that one will not be able to run continuously, for they have

no orders ahead. What has the sliding scale enabled us to do at Edgar Thomson? It made us feel that we are prepared to make any sacrifice to give steady employment. The price—4 pounds of steel for a nickel—leaves profits to the average mill in this country out of the question. But you have a steady employment. I rejoice to see that, owing to the increased capacity of the mills, your aggregate wages are even higher than before. You have to work harder, no doubt, but in these times the owners have to work harder also.

### PITTSBURGH VERSUS CHICAGO.

In this connection you have read a great deal recently of a vast combination in steel-making formed in Chicago. I have no desire to underrate the importance of that movement, nor of \$5,000,000 to be applied to the building of works for plate-making, structural shapes and all the various forms of steel. I have expected such action for some time. There is nothing surprising to me about it. I have told this community, and I have labored for years to impress it upon the railroad companies of the State, that the latter had made it possible, by heavy reductions of rates upon material destined for points beyond the limits of the State, to manufacture a ton of Bessemer steel pig iron just as cheap in Chicago as it can be manufactured in Pittsburgh. There is no question about this. It is a matter of figures which I have given, which no man has ventured to contradict, and which has been publicly corroborated by Mr. Stewart, general freight agent of the Pennsylvania Company. I am credited with having said that the South was to be Pennsylvania's great rival; but what I said was that it was to be the chief competitor for foundry iron in the Eastern district of Pennsylvania. The South will not trouble Pittsburgh. Our competitor is not in the South—it is in Chicago.

In the year 1887 Chicago district made more tons of steel than the whole of Western Pennsylvania, and I warn capital and labor in Pittsburgh that a severe struggle is in the future for both.

### THE RAILWAYS ARE CHIEFLY RESPONSIBLE

for this situation. Every carload of coke you see coming from Connellsville in our own cars for Pittsburgh furnaces is charged just double the freight rate as if destined over the same ground for Chicago furnaces. There is no question of longer or shorter haul, for the coke is loaded and unloaded by us and carried in our own cars. The cost of hauling Pittsburgh or Chicago coke is just the same to the great monopoly which stakes against the State, whose creature it is. The Pennsylvania Railroad Company have already piled up \$19,000,000 of surplus, and last year had \$4,000,000 surplus after paying their dividend—all exacted unjustly from the State. The ore to Chicago furnaces is carried by Western railroads from the Lake Superior mines to Chicago at rates only a little above one-half those per ton per mile exacted from Pittsburgh furnaces by the Pennsylvania Railroad Company. The Baltimore and Ohio Railroad Company carry ore from the lake to Ohio furnaces for 50 per cent. less than the Pennsylvania Railroad exact for less distance upon ores to Pittsburgh. These two cases of discrimination alone add \$1 to the cost of every ton of iron made in Allegheny County, and many men go idle in your midst to-day in consequence of this injustice. We are in the hands of a grasping monopoly, and nothing we can do seems to bring us simple justice. The Pennsylvania Railroad Company, although its creature, has become the enemy of the State of Pennsylvania. All this, of course, must change. An indignant community will some day rise and exact justice through means of a State law, which will see that the traffic of the State of Penn-

sylvania is not charged more than similar traffic carried by Pennsylvania railroads through its territory.

Do not receive the impression, although we have great obstacles to overcome, that we are going to give up the fight. Never! We propose to fight it out on this line here, and I, for one, have no fear but what Pittsburgh will eventually be placed in a position in which it can hold its own, and increase and prosper. You are with us, we are with you—united thus we will stand and conquer.

### NOT IN A TRUST, AND WHY.

It is reported that our firm intended to join a combination of rail manufacturers. This would mean that we had agreed to give our men work for a portion of the year only, because no combination can act except by restricting production. Well, fellow-workmen, to be frank with you, there is temptation in our path. The firm could probably make more money just now, in depressed times, by manufacturing less, but where would labor be with work perhaps only half the year? In two of the three rail mills at Chicago men will not get work for even a quarter of a year, if indeed these mills run at all. If we had not made a partnership with our workmen we might have considered the proposition. Having them with us in the struggle, we reject it—and will continue to run our works to their capacity as long as orders for rails can be obtained at prices which do not involve a dangerous sacrifice of capital. Edgar Thomson Works are all right, and with fair railway rates, which Pennsylvania railroads will soon be forced to give, I repeat to you what I said on a memorable occasion, when we had a little unpleasantness, which is happily forgotten and forgiven on both sides: "It will be a cold day when Edgar Thomson gets left!"

### THE SITUATION AT HOMESTEAD.

Turning our eyes across the river, just the other day I received a letter from Homestead, dated March 14, from which I wish to make this extract:

*Mr. Carnegie*—DEAR SIR: A tradition prevails that once upon a time you promised to do something for Homestead soon. When or where or to whom this promise was made no one can exactly tell. It is enveloped in the mists of antiquity, and commands respect accordingly.

"Do something for Homestead?" Well, we have expected for a long time, but, so far, in vain, that Homestead should do something for us. But I do wish to do something for Homestead. I should like to see a co-operative society formed there. I should like to see a library there. I hope one day that I may have the privilege of erecting at Homestead such a building as you have here, but this letter compels me now to say that our works at Homestead are not to us as our works at Edgar Thomson. Our men there are not partners. They are not interested with us. On the contrary, an amalgamated association has for years compelled us to pay one-third more in the principal department of our works, the plate mill business, than our great competitors pay in Pittsburgh. They have compelled us to pay, and are driving away our trade in consequence, three times as much per ton for labor as our leading competitors outside of this district. More than one man at Homestead makes more not only than the foreman who is over him, but more even than the manager of all the works, and the great mass suffer in consequence.

Even to-day I learn that our firm is notified that after July next they will demand a further advance, ranging from 15 to 25 per cent. These men evidently require a library and need to read the newspapers. Steel business never so bad—competitors all reducing wages, and our men take this time to demand an advance! It is folly like

this that defeats the efforts of fair employers to benefit labor. Of course, no advance can be given, but the firm may be induced to give Homestead the benefit of a sliding scale, under which it can run steadily, and our men there make such wages as you make.

Fellow-workmen, personally I have arrived at this position: I have no desire to accumulate more money. The desire of my wife and myself is to know how best to administer what we have, and we both recognize to the fullest extent that in this great city, whence our revenues have come, most of these surplus revenues should be expended; but, with the exception of one or two partners, the 18 or 20 young partners now interested in our concerns are not rich men. Many of them are in debt for the interests which they own. When the firm cannot make interest upon its capital, these young partners will be worse off than nothing, for they will be in debt. The firm's operations must be conducted with the strictest regard to commercial principles. They must have their labor at the same prices as their competitors pay, or labor cannot obtain steady employment. The men to whom they give work must not seek to destroy the business of the firm by unfair exactions. If they do seek, they cannot be allowed to do so.

When the labor in the Homestead works, like the labor in the Edgar Thomson, goes hand in hand with us as partners, I trust that able, fair-minded men there will come forward, as they did here, and establish their co-operative society, their library and their beneficial society; and all I can say in answer to my correspondent is that, anxious as that correspondent may be for something to be done for Homestead, my desire for that is greater than my correspondent's, and I promise that the first dollar, or the first hundred thousand dollars, I receive from my investment at Homestead, if ever I receive a dividend, will be at the disposal of the men at Homestead, to be expended for their benefit.

The rates on pig iron which went into effect on the 1st from Southern producing districts are as follows:

	Birming- ham.	Chatta- nooga.	Shelf- field.
Allegheny, Pittsburgh and Wheeling.....	\$4.65	\$4.15	\$4.40
Chicago and Detroit...	4.00	3.75	3.75
Cincinnati.....	2.75	2.25	2.50
Cleveland.....	4.00	3.50	3.75
St. Louis.....	3.25	3.00	2.80
Kansas City and Leav- enworth.....	5.49	5.49	5.04
Louisville.....	2.50	2.25	2.25

These represent the leading markets.

The new building just completed on the corner of Wall and William streets for the Bank of America is among the most substantial and attractive banking houses down-town. The style of architecture is Italian Renaissance, the materials being Maine granite and Indiana limestone. The façades are so treated that there are only three main horizontal subdivisions, notwithstanding the fact that there are nine stories. The lowest subdivision consists of the basement and first story, the second consists of two stories also, and the third consists of three stories, and includes the upper arches, above which is the main cornice. This cornice is treated with a broad frieze, which is pierced by the windows of the seventh story, while above the main cornice rises the upper story, taking the place of a high parapet. The cost of the whole is to be about \$500,000. The architect is Charles W. Clinton and the builder D. H. King, Jr.

The executors of Augustus Schell, formerly collector of this port, obtained a judgment for \$154,275 against Joseph C. Williams, on a promissory note for three years.

## THE WEEK.

The Samoan question has incidentally caused the destruction of three vessels and the loss of life of 50 men belonging to the United States Navy which had been concentrated in the harbor at Apia during the season when hurricanes are almost regular visitors. The Trenton, Vandalia and Nipsic were driven ashore, and excepting the latter all have become total wrecks. It is conjectured that had it been possible to get up steam immediately they might have escaped. Commercial vessels never linger at the islands longer than is necessary during the "hurricane season." The Germans lost two men-of-war and 96 men during the blow, and a third vessel, like the Nipsic, was driven ashore.

Building operations in Philadelphia during March were the largest in the history of the city, involving \$4,000,000.

The elevated railroad system in Brooklyn is being rapidly extended into the remote suburbs. The Myrtle avenue extension of the Union road to Broadway will soon be completed and work on the Fifth avenue branch has been resumed, affording a direct connection with Greenwood. The Kings County road will shortly have an extension to the new Twenty-sixth Ward, and will build a branch from Myrtle avenue through the Eastern District to Greenpoint and Newtown Creek, putting these remote parts within easy reach of the City Hall and bridge. The valuations of real estate are likely to be much affected.

Success in commercial life is promoted by a liberal education. At Princeton's Alumni dinner last week Chauncey M. Depew said: "There is this peculiarity about this rush for office, when 4,000,000 of the 18,000,000 of American voters are aspiring, that very few are the graduates of great universities." The reason for this, said Mr. Depew, was that a college training developed manhood and independence and qualified its recipients for the more permanent and honorable prizes of professional and commercial life.

Eight non-union Swedes in Holbrook, Mass., employed on lasting machines in White's shoe factory, were blown up with dynamite at their boarding-house. No injury was done beyond wrecking the building.

The American Dredging Company, of Philadelphia, have contracted to deepen the ship channel at Baltimore for \$188,000.

The Philadelphia and Reading Railroad are expected to run through trains to Boston and the East upon the completion of the Pennsylvania, Poughkeepsie and Boston Railroad. With this connection the Reading will run trains over the North Pennsylvania Railroad to Bethlehem and thence to the bridge, reaching connections which now exist on the other side. It is likely that this route will be used for carrying Schuylkill coal to New England.

A large portion of the crib bulkhead built by the Lehigh Valley Railroad for their Jersey City terminus slid into the river, carrying with it several railroad tracks and bringing a year's labor to naught.

A site has been selected for the new Chamber of Commerce in Boston, to cost about \$250,000.

The assessment roll of the property owned by the city of Montreal places its value close upon \$5,000,000.

There are indications of an early opening of the St. Lawrence River.

The Montreal Gazette, Government organ, referring to President Harrison's proclamation in relation to Behring's Sea, does not touch the real points in the controversy, as the United States are acknowl-

edged to have absolute jurisdiction within a marine league of the shores of Alaska. As regards the open sea, "Great Britain by treaty with Russia secured the recognition of the right of fishing by British subjects therein."

Commercial union with Canada was earnestly advocated by Erastus Wiman, of New York, at a dinner of the Portland Board of Trade last week. Among other things, he said: "Commercial union has become a question upon which the continued welfare of the whole of the New England States may presently depend. With the opening of the iron and coal mines in the Southern and Western States a great change is occurring in this country, somewhat to the disadvantage of the Middle States and New England. Under this disadvantage numerous heavy machine works in New England are likely to be hampered because of the disadvantage in the price of material." Mr. Wiman asserted that in Nova Scotia ample supplies of the best iron, the best coking coal and of chemically pure limestone lay close to each other within a radius of 6 miles from sea and railway, and he argued that if they should be worked under commercial union the vast industries in which New England used to excel all parts of the United States—the manufacture of machinery, locomotives and heavy stationary engines—might be regenerated.

The president of the American Bank Note Company, A. D. Shepard, bought the Electric Building on Church street for \$175,000. The property overlooks Trinity Churchyard. The New York Coffee Exchange bought three lots on Beaver street, adjoining the Cotton Exchange and running through to Pearl street, for \$230,000. Cotton and coffee will therefore be neighbors.

Interesting facts pertaining to the grain production of the United States are given in the March crop report of the Department of Agriculture. The amount of wheat in the country retained for consumption is almost identical with that of last year, but the distribution prior to March 1 has fallen: from 256,166,200 bushels in 1888 to 213,837,320 bushels in 1889. As to the corn crop, the report says that the quantity of corn consumed has been slightly greater than ever before recorded, about 1,201,000,000 bushels in five months after ripening, or from October 1. Still the quantity on hand is quite as large as ever before, though only a few million bushels more than was reported three years ago. The percentage of the entire crop on hand March 1 is slightly below that of 1886, but greater than any other year. The value of the whole crop, if calculated on the basis of present prices, is \$635,200,000. December prices would give about \$42,000,000 less.

Railroad building is at an end in China for the present, the Conservatives having gained complete control of the young Emperor. A Tien-tsin letter says it is certain that the fifth prince, the oldest surviving brother of the Emperor Tao Kwang and uncle of the present Emperor, Kwang Hsu, has formed a combination with the Emperor's tutors and the leading men of the six Boards of Government and has succeeded in blocking all plans for the extension of the Tien-tsin-Kaiping Railroad toward Peking. The Throne has been forced to withdraw its sanction for the extension and to forbid all further proceedings on the part of the company. The proposals recently sent in for the rails and cross ties have been rejected.

The report of John Bigelow, Commissioner of the United States to the Brussels Exhibition last year, to the Secretary of State, sets forth the fact that the exhibition was a purely private speculation, which the Belgian Government did not

take any particular interest in until within a short time before it opened. In addition to this there was a deep-seated hostility on the part of a large portion of the Belgian press toward the persons in charge of the exhibition, in consequence of which the affair was not so successful as it might have been. American exhibitors numbered only 74, instead of 200, as had been expected, but of these Mr. Bigelow says 54, or about 75 per cent., received awards of prizes. Of the \$30,000 appropriated for the expenses of the commission, only \$17,118 were expended.

It is said that the Naval Board will recommend preparing for service the 12 old monitors lying at navy yards, some of which have remained idle for 20 years. The monitors at Richmond are the Ajax, Canonicus, Mahopac, Manhattan, Wyandotte, Catskill and Lehigh. Those at League Island are the Josen, Montauk and Nahant. The Passaic is at Annapolis and the Nantucket at New York.

Ferdinand Vandertaelen, an alleged victim of the copper speculation in Antwerp, was formerly mayor of that city. He is reported to have failed for \$8,000,000, an amount \$2,000,000 in excess of the total assets. Immediately on this event becoming known he committed suicide. Large quantities of wheat held in New York on account of parties representing his interests were sold in this market at a decline.

Private organizations cannot be taxed as corporations, according to the decision of Judge Barrett in the Supreme Court of this city. The case before him was brought on a writ of *certiorari* for the review of the Tax Commissioners' action in assessing the capital stock of the National Express Company. The company were formed in 1853, but is not incorporated. Since the organization, the Judge says, substantial privileges have been conferred upon joint-stock companies. The privileges are undoubtedly corporate incidents, but do not in terms create corporations, nor do the acts profess to authorize them. On the contrary, they expressly declare the opposite intent. A corporation cannot be formed by a private agreement between individuals. The franchise must proceed from the State; and even the State cannot compel people to accept its bounty. There is, in fact, no statute of the State providing for the formation of joint-stock companies or limiting their organization. The conferring of these privileges no more creates a corporation than would general legislation conferring similar privileges upon ordinary partnership. Judgment is given for the company.

Charles Arbuckle, the well-known coffee man, has made preparations to erect a \$1,000,000 building on the site of the Hotel Dietor, opposite the City Hall, Brooklyn, and will begin work immediately.

The New York Central road is going to try a new kind of fish-plate for connecting the rails. It is more than 3 feet long and follows the curves of the rail, fitting very closely, and overlapping to the sleeper.

Electric subways make no end of trouble. The last move against them is an injunction by the Western Union Telegraph Company restricting Mayor Grant and the Subway Commissioners in their efforts to put the aerial wires underground. The recent explosions of gas in the conduits offered a timely argument in support of the view that the subways are useless. Engineer Kearney, of the Board of Electric Control, charges that the explosions are wholly due to rotten gas-mains. While building underground conduits, he says, "many of the mains were found to be so rotten that they could not be moved. Some of the iron pipe in which gas is

conveyed was laid 30 years ago, and it has so rusted and decayed that it crumbles to pieces when exposed to the air. I am informed that one-third of the gas manufactured is accounted for by the companies on the ground of leakage—that millions of cubic feet are absorbed by the earth daily, and any person who has been in a newly-dug trench can realize the possibility of this being true. This leaking gas penetrates the sewers, basements and, in a good many instances, the upper floors of buildings, and we are breathing poisoned air continually. Unless radical steps are taken the evil will grow more rapidly as the pipes decay. We will, however, doubtless be able to devise a plan to prevent subway explosions." The injunction obtained from Judge Wallace, in the United States Circuit Court, is based chiefly on the allegation that the insulating material is baked and destroyed in the subway by heat from the steam-pipes adjacent to the wires. Injecting powerful currents of fresh air may remove all difficulties.

In some respects Philadelphia does not suffer from a comparison with New York. The Twenty-third Ward in that city contains 42½ square miles.

Captain Howard Patterson, formerly chief inspector of the New York Navigation School, has been made admiral of Legitime's Haytian navy, and accompanied by an experienced gunner has started for his destination.

No great success has been attained thus far in silk culture in the United States, although in years past very fine exhibits of cocoons have been made at the California State fair in Sacramento and elsewhere. More recent efforts are spoken of encouragingly by the president of the Women's Silk Culture Association of the United States in the annual report just issued, who says that people are learning to raise cocoons and tree-planting, and that when this becomes general the country could in a short time "raise not only its own silk but much more." Persons who remember the *morus multicauli's* furor of perhaps 20 years ago and the large area then devoted to the culture of mulberry trees, together with the losses and disappointment that followed, will not give undue importance to more recent predictions. In California all the conditions as to labor, soil and climate were in the highest degree favorable, and the processes in many instances were conducted by practical silk-growers from China. Nevertheless, surveying the field to-day, it does not appear that any very remarkable progress was made toward establishing a permanent industry. It is only in the manufacture of certain descriptions of goods from the raw material that there has been a substantial gain.

Dr. John Swinburne, for six years Health Officer of this port, and to whom, more than any other man, the city is indebted for its excellent quarantine arrangements, died in Albany, March 28.

An act of the Legislature was ratified at the polls in Wilmington, N. C., which practically exempts all new manufacturing enterprises from municipal taxation for 10 years.

The President's Oklahoma proclamation will throw open to homestead entry on April 30 about 1,800,000 acres, and a lively scramble for claims is in prospect. Boston finds special satisfaction in the announcement from the fact that her citizens are so largely interested in the Atchison road, the only one penetrating this region, and which will receive an immediate benefit. While the land to be settled cannot be taken in larger lots than 160 acres to the individual, some way will doubtless be found to start a real estate speculation. The late opening of the region will pre-

vent seeding with most crops except corn and vegetables this season. Officials of the Rock Island Railroad and a corps of engineers have started from Topeka, Kan., to make the final survey for an extension through the Indian Territory.

Large amounts received by collectors for the Market Bureau in this city are not accounted for, and the disappearance of the books, as well as the "cooked" condition of some that have been examined, affords reasonable ground for suspicion that the city treasury has suffered during the last few years to the extent of some hundreds of thousands of dollars. Several alleged "boodlers" are more or less implicated, and prolonged investigations are in prospect.

Wheat statisticians in the Northwest compute the stock of wheat in that section of the country awaiting a market at 20,000,000 bushels.

The Cleveland Plain-Dealer states that, with the opening of navigation, 28 large steam and sail vessels will be added to the Cleveland fleet, and altogether 242 boats, with a gross tonnage of 164,644.56, will be enrolled at Cleveland. From figures recently taken from Lloyd's register, an approximate estimate of the value of this immense amount of floating property places it close to \$10,000,000. These figures are not startling when it is known that for three years past the shipyards of the lakes have been turning out from \$6,000,000 to \$8,000,000 worth of new boats each year, with Cleveland's share of the work ranging from \$2,000,000 to \$3,500,000. Of the 242 vessels referred to 113 are sail and 129 steam—nine of the latter being steel. The F. W. Wheeler Company, of Bay City, Mich., have 14 vessels on the stocks, with an aggregate value of \$1,000,000. Five of them are between 260 and 281 feet in length. The largest will all be ready to launch in May.

The strike of weavers in Fall River, Mass., collapsed after lasting a fortnight. It was begun with the purpose of forcing an advance of wages, and some 6000 weavers joined in it, practically closing all the mills in the city. The employers refused to yield, claiming that they could not afford to raise wages. The workmen returned only after exhausting their surplus funds.

American lard is a large and increasing factor in the export trade of this country, despite the hostility of several foreign governments. Refined lard, however, has fallen off in the export list fully 50 per cent., foreigners preferring to refine for themselves. Statistics compiled by the New York Produce Exchange indicate an excess this season compared with last of nearly 35,000,000 pounds from the Atlantic seaboard. Since November 1, the beginning of the season, there have been exported to all foreign ports an aggregate of 141,797,354 pounds, against 107,047,792 pounds during the corresponding period last season. This large increase, coming as it does in the face of reports of foreign discrimination against the American product, is regarded with considerable surprise by members of the trade, who ascribe it mainly to the low prices that have been current this season. The increase in this season's exports is greatest in the United Kingdom, which has so far taken in round numbers 20,000,000 pounds more than last season, while the Continental ports have taken about 15,000,000 pounds more.

Charles P. Huntington, associated with Senator Stanford, of California, has procured authority to issue \$50,000,000 additional stock, which will provide means for absorbing several thousand miles of railroad on the Pacific Coast north of the Sacramento River, thereby extending the Southern Pacific system over a large expanse of territory.

## MANUFACTURING

### Iron and Steel.

In answer to a rumor that a syndicate of capitalists of Louisville, Ky., were endeavoring to purchase the Millvale steel plant of Graff, Bennett & Co., at Pittsburgh, for the purpose of developing a new process for the manufacture of steel, we can report that there is no truth in the rumor whatever. A party of Louisville gentlemen visited the Carbon Iron Company, of Pittsburgh, one day last week for the purpose of purchasing several old trains of rolls, with engines and other machinery, which that company are anxious to dispose of, with a view of replacing the same with entirely new machinery. According to reports extensive experiments were made at the plant by these parties, but we are informed this is also untrue. In this connection we may state that for a new concern the Carbon Iron Company have been more than usually successful. At present they have enough orders on hand to keep their plant in full operation up to July next. Among other orders the company have received a contract to supply about one-half of the material for the new Merchants' Bridge, now in course of erection at St. Louis.

The new plant of the Muncie Nail Company, at Muncie, Ind., contains 16 puddling furnaces, 4 heating furnaces and capacious annealing furnaces. The machinery includes a 20-inch train of rolls, a plate train, muck train and 50 nail machines. There is also a complete foundry for iron and brass castings, and a cooper shop for the manufacture of kegs. This concern is the successor to the Greencastle Iron and Nail Company, of Greencastle, Ind., the plant having been removed to Muncie some time ago. When running to their full capacity the new concern will employ about 200 hands.

About eight months ago the Cambria Iron Company, of Johnstown, Pa., blew out and dismantled their Frankstown furnace, at Frankstown, Pa. About a month ago the old stack was sold to a party who turned it into a lime kiln and is now making lime in it. It was an old-time furnace that ran on fossil ore, producing mill and foundry pig, and was entirely worn out and out of date for modern work.

The new works of the Roanoke Rolling Mill Company, at Roanoke, Va., are approaching completion.

On the 22d ult. the Longdale Iron Company, of Longdale, Va., blew out their No. 1 furnace with the object of pulling it down and replacing it by a better and slightly larger stack.

The Warwick Iron Company, at Pottstown, have decided to work up the stock of ore, &c., on hand and blow out for repairs. Up to the end of the month the furnace had made 103,000 tons during the present blast.

A reduction of 5 per cent. in the wages of unskilled labor and 10 per cent. in that of skilled labor went into effect at the Pennsylvania Steel Works, at Harrisburg, 1st inst. Notice has been given by the Columbia Iron Company, in Lancaster, Pa., that their mill will be closed on April 6th owing to the dullness of the market.

Alex. Laughlin & Co., engineers and contractors, of Cleveland, Ohio, report, under date 28th ult., that they recently furnished the Middlesport Steel and Nail Works with working drawings for a Smith ingot-heating furnace, with working hearth 7 x 20 feet, which is now in course of erection. They also sold the Eureka Iron and Steel Works, Wyandotte, Mich., a shop-right for the use of their improvements in furnaces and pro-

ducers, and furnished them with working drawings of a bar-mill furnace 7 x 18 feet, which will be built at once; upon the completion of which they design changing their entire mill to this system.

In our issue of March 28 we stated that the old Cortwright rolling mill, Allikanna, Ohio, would start up and be operated by the National Tube Works and the product be shipped to McKeesport. We have the authority of J. R. Jackson, of Pittsburgh, for the statement that the National Tube Works will not operate the mill, since they do not own it. The product will be sold in the open market.

The Etna Iron and Steel Company, of Bridgeport, Ohio, have issued a neat pamphlet, giving an Eastern price list of extras on bar iron, bar steel, angles, tees, channels, light rails and iron and soft steel sheets and plates. The pamphlet contains also tables of weights of flats, rounds and squares, tires, ovals and half ovals, angles, tees, channels and plates.

Charles L. Miller, superintendent of the Missouri Furnace Company, South St. Louis, writes us: "For the week ending March 16 No. 1 Furnace of the Missouri Furnace Company made 645 gross tons of No. 1 Bessemer pig. This is the second time since going in blast on October 15 that about this output has been reached, the product for the week ending January 26 having been 644 tons. For the size of the furnace we consider this pretty good work. The total height is 58 feet 2 inches, and the diameter of bosh 15 feet 2 inches. The working height of the furnace under the hopper is 54 feet, and the working capacity is 6428 cubic feet. We run to make high silicon Bessemer iron, and cannot, therefore, claim much in the way of low fuel, but even that item is very good. To make the above 645 tons the furnace had to clear itself eight and one-half times during the week, putting the stock through in 19½ hours. The furnace is equipped with two Gordon stoves 50 x 19 feet, the average temperature of blast being about 1280°. The best day's work has been 101 tons, the best week 645 and the best month 2630. The best day has been in the best month, but the best week has been in the past month. The 645 tons is at the rate of 100.3 tons per week per 1009 cubic feet capacity, which I think will compare favorably with some of the best records. We use ores from Iron Mountain and Connellsville coke for fuel, with a small percentage of Illinois coal."

Notices have been posted in the rolling mill of the Columbia Iron Company, at Columbia, Pa., that after April 6 \$3.50 per ton will be paid for puddling iron and other ton men in proportion. The management state that either a reduction or complete shut-down is necessary. The Penn Iron Company, Limited, of Lancaster, Pa., have also posted the same notice of reduction.

The United States Iron and Tin Plate Company, Limited, of Demmler, Pa., are completing the erection of a large sheet mill to their plant. This mill was planned and partly built in the fall of 1887. The company inform us it will be ready to commence operations about June next.

The National Tube Works Company, of McKeesport, Pa., are erecting 20 additional puddling furnaces at their plant, which, when completed, will give the company a total of over 100 puddling furnaces. The new plate mill recently completed by this firm is ready for work, and will be put in operation at an early date.

Week before last the blast furnace of the Girard Iron Company, at Girard, Ohio, turned out 1292 gross tons of pig iron.

This remarkable output exceeds by nearly 75 tons that of any equal period in the history of the furnace. This plant has been in continuous blast for 113 weeks, during which time the production amounted to 117,819 tons of pig iron, an average of 1042 tons per week.

The Stewart Iron Company, Limited, at Sharon, Pa., are erecting a building 22 x 26 feet, to be used as a laboratory.

McLanahan, Smith & Co., Limited, lessees of the Juniata Rolling Mill, at Hollidaysburg, Pa., have reduced the wages of their puddlers from \$3.75 to \$3.50 per ton. The same action has also been taken by the Hollidaysburg Iron and Nail Company, of that place.

The stockholders of the Youngstown Bridge Company, recently organized at Youngstown, Ohio, have elected the following directors: James Neilson, Hamilton Harris, B. F. Boyd, Ed. Hazeltine, J. H. Thompson, Andrew Millikin and L. E. Cochran. The directors elected James Neilson, president; L. E. Cochran, vice-president; B. F. Boyd, secretary and treasurer. The entire capital stock of \$100,000 has been subscribed, and work will be commenced at once to erect the necessary buildings at Haselton. One hundred men or more will be employed.

Hecla Furnace, of the Hecla Iron and Mining Company, at Ironton, Ohio, was blown out on Monday, the 25th ult., for the purpose of being relined and repaired.

The entire plant of the Spaulding Iron Company, at Brilliant, Ohio, which has been idle for some time, resumed operations in full last week.

The stockholders of the Burns Copper Welding Company, recently organized at Pittsburgh, have elected W. J. McKeever president of the concern. This is the company recently formed to control the Burns patents for welding copper, and it is understood will shortly secure a property and commence operations.

The Tennessee Range and Mfg. Company's works in Nashville, Tenn., were burned, 27th ult.; loss, \$65,000.

The large pipe foundry of the West Superior Iron and Steel Company, of West Superior, Wis., is under roof, and the construction of the pits inside and the placing of machinery is progressing. The foundry will begin melting for the purposes of this company toward the latter part of May, and it is expected that the manufacture of pipe will begin in July. The foundation for the 20 x 80-foot blast furnace was put in last fall, and work upon it will be resumed with the opening of spring.

Joshua S. Ingalls & Co., of Troy, Ohio, announce that they have enlarged their facilities for the manufacture of Craig steel, which is made from a special mild steel by their own process. The sheets, which are destined chiefly for the uses to which Russia iron is put, are cut into 20 x 60-inch, and are packed in cases of about 250 pounds each.

It is reported that the Crown Point Furnace, at Crown Point, N. Y., is soon to go in on Bessemer pig.

No. 2 stack of the Port Henry Furnace Company, Port Henry, N. Y., has reached the greatest output since it has been built, making 2023 gross tons during March, the last week's work being 482 gross tons, from all native magnetite from the mines of Witherbees, Sherman & Co. The furnace is now under the management of H. M. Langdon, formerly of Chester, Pa.

Rosena Furnace, at New Castle, Pa., operated by Oliver Brothers & Phillips, continues its exceptional work under the management of G. E. Tener. In March it

produced 5442 gross tons, and its average product for the four months of December, January, February and March has been 5072 gross tons of mill iron. This product is remarkable considering the equipment, the old-style pipe hot-blast stoves being 17 years old and the engines and boilers dating from the same time. Considering everything, this record is, we believe, unsurpassed.

In March Girard Furnace, in the Mahoning Valley, Ohio, eclipsed its best former record, making 5708 gross tons in that month.

The Allegheny Bessemer Steel Company, of Pittsburgh, are ready to go on double turn.

#### Machinery.

The Fort Pitt Foundry of Mackintosh, Hemphill & Co., Limited, at Pittsburgh, was damaged by fire to the extent of \$60,000 on Tuesday, the 26th ult. The fire started in the ingot mold foundry, from whence it spread to the small work foundry adjoining, the second story of this small work foundry being the pattern shop, while the third story was used as pattern storage loft. These buildings were entirely destroyed, with their contents. The machine shops, main foundry and steel foundry were untouched. There will be no hindrance of work in any of these departments, except where needed patterns were destroyed. The firm started to replace these at once, and have also arranged with other foundries to fill their orders for ingot molds until they can get ready to make them, which will be in a few weeks. The interruption to the business of the firm is about as little as could result from a fire of such extent.

The St. Joseph Pump Company, St. Joseph, Mo., write under date of 26th ult. as follows: "Our business was never better. We are 60 days behind with our orders and are running night and day, while prospects of a continuance of this state of affairs are very flattering."

At the annual meeting of the stockholders of the American Waltham Watch Company, of Boston, Mass., held on Thursday, the 28th ult., it was voted to increase the capital stock \$1,000,000, making it \$3,000,000. A dividend of 50 per cent. was declared. Royal E. Robbins, treasurer of the company, said with regard to the dividend that it had been declared on the advice of the late Sidney Bartlett shortly before his death. It was, he said, a cash dividend. The company have a surplus of \$2,000,000 above their capital, for which the stockholders had nothing to show, and this course had been taken that they might have some evidences of their property. The capital stock had been increased to the extent of the cash dividend, and those of the stockholders who wished could take the cash they received in dividends and purchase new stock at par in *pro rata* proportion to what they already held. It was not a stock dividend. The other \$1,000,000 surplus would be used in carrying on the business of the company. There would be no addition to the works on the head of the increase in stock. In 1865, when the capital stock was \$300,000, a dividend of 150 per cent. was made and the stock increased to \$750,000. In 1880 a dividend of 100 per cent. was made and the capital increased to \$1,500,000, and in 1885 the stock was increased \$500,000, for which the stockholders paid.

A. J. Boyce, proprietor of the Industrial Foundry and Machine Works, at East Liverpool, Ohio, under date of the 30th ult., writes us as follows: "Our works, which were totally destroyed by fire January 3 last, are now almost completed, and will be in running order in every department within the next 20 or 30 days. Our build-

ing is being constructed entirely of iron, which will be a preventative against anything of like nature happening to us which occurred at that date. Part of our new machinery has arrived and others being forwarded daily. When we have everything completed and in running order we will have one of the finest and most substantial plants of the kind in the State of Ohio, or even throughout the country."

The latest achievement of the Billings & Spencer Company, Hartford, Conn., is the making of drop forgings from Tobin bronze, a new metal produced by the Ansonia Brass Company. It is excellent for parts of engines and machinery which are exposed to corrosion, and where greater strength is required than is afforded by ordinary brass or bronze. This company have just added two more drop hammers, bringing the total number now in operation up to 40. They have applied for a permit to erect an addition to their forge shop 410 x 90, more room being needed for their increasing business, and report a good outlook in their line for the remainder of the year.

E. E. Garvin & Co. announce that they have secured a long lease of the new building at Laight and Canal streets, New York, their new quarters containing about 45,000 square feet of floor room and having light on three sides. They propose to add to their modern plant new facilities as fast as required.

Wm. Nehring & Co., mechanical engineers, of Evansville, Ind., while making a specialty of metal patterns, are well equipped for doing all kinds of machine work and for making gray and malleable iron castings. This firm have had a shop experience of many years and are well qualified to handle work in a satisfactory manner.

We have received from B. W. Payne & Sons, of Elmira, N. Y., an illustrated description of their high-speed steam engines. For some time the requirements of the trade in steam engines have been in the direction of close regulation and economy in the use of fuel. The engines made by the above firm should afford the same economy as the Corliss, and should have the close regulation of the single-valve automatic, since in them the Corliss wrist-plate and valves are combined with the shaft governor.

#### Hardware.

During the month of February last the nail factory of the Salem Wire Nail Company, at Salem, Ohio, turned out 40,000 kegs of wire nails.

Plumb & Lewis Mfg. Company, Grand Rapids, Mich., report that they have recently had large export orders from Australia, England, Germany, France and other foreign markets. They are increasing their force to meet the demand.

The Humphrey Tool Company, Warren, Mass., have recently been increasing their facilities for manufacturing their various specialties. They have put in two new upright drills, one a three-spindle sensitive drill. Also a water emery grinder. Trade is reported to be opening well both in this country and for export.

The Standard Horse Nail Company, of New Brighton, Pa., are inviting bids for the erection of an addition to their factory that will double the present floor room of the establishment. The main building, fronting on Second street, is to be extended on the south 52 feet 2 inches, making the front of the entire building 263 feet. The extension proposed will be extended of equal width back to Fourth street, a distance of 248 feet 3 inches, making the new addition 248 feet 3 inches by 52 feet 2 inches. The structure is to be of brick, one story high, with cement

floor and iron truss roof, with corrugated iron covering. There will be no woodwork about it except the window frames and sashes, which will make the factory as nearly fire-proof as is possible.

#### Casting Small Ingots.

In July last year G. F. McLeaur and W. H. Faber, Jr., were granted a patent on an ingot mold, permitting direct rolling into slabs, without the intervention of blooming and hammering. The mold now in general use for casting steel ingots is made of cast iron in one piece, having the appearance of a truncated pyramid, the taper being very slight and just sufficient to allow clearance in "drawing." This shape of mold has proved itself unsuited to the purpose, as there is such a difficulty in drawing the ingots that a large supply of extra molds must be kept on hand to meet the requirement of the converter's successive heats, and many of the molds are soon rendered useless by the rough treatment received by them in the effort to draw. All this entails heavy expense upon the manufacturer of steel. Again, the ingot produced in this old form of mold is honeycombed and extremely heterogeneous, and requires considerable reworking to render it of the requisite homogeneity for the uses to which it is to be applied.

The inventors state that they have demonstrated by actual experience, upon a very large scale, that ingots cast in their mold are in a perfect condition for rolling without the intermediate step of blooming, which they claim in addition to its cost is positively injurious to steel of certain kinds, particularly low-grade steel, the reheating of the steel rendering it more brittle and less ductile than that not subjected to the blooming. Another item of cost in the ordinary method is that where two or more molds are cast at the one time on a single casting table there is a gate-piece to each ingot and a runner common to the several ingots which must be broken off, and is then valued only as waste. In their mold for casting they make but one runner where there are now two, thus reducing this single item exactly one-half, and they claim that on account of the peculiar shape and combination of their molds, the ingots are much more readily removed, and that there is such a small possibility of breaking the molds that the cost of molds and amount of labor required in the casting and drawing operations are greatly lessened, thereby lessening the cost of the steel ingots.

They aim to produce an ingot-mold in which all the desirable features of an open mold are retained and all the objections to a closed mold are overcome.

The ingot-mold has its sides and bottom and one end solid and its top and the other end removable, the top being formed of a single piece of the same metal as the mold and the removable end formed of fire-brick having an orifice through its center for the passage of the molten steel. Two molds have a common run and a removable bar placed between the two molds and under the run, whereby the ingots can be readily drawn at the one time.

Advices from Pittsburgh are to the effect that the shut-down of several of the coal works along the Monongahela River is but the beginning of what will probably be a general shut-down in all of the pools. One operator has stated that within a few days all of the river mines will be shut down, and that work will not be resumed until the miners agree to accept a reduction of  $\frac{1}{4}$  cent per bushel, which would put the rate of mining at 24 cents. If all the lines along the Monongahela River close it will throw about 5000 miners out of work.

## Freight Rates in the Eastern Iron Trade.

Last week we published abstracts giving an expression of opinion by two of the leading Northern ironmasters, Andrew Carnegie and Abram S. Hewitt, on a subject which has been eagerly discussed in a quiet way by producers east and west of the Allegheny Mountains. During the past few years there has been a good deal of shifting of markets in raw and finished irons. The invasion of Southern pig has only been one phase of this revolution. The introduction of natural gas in the West has been another cause of irregularity in finished articles. But the marketing of growing quantities of goods from distant producing centers has been chiefly due to changes in the freight rates by more progressive railroad managers, while in other producing sections the roads have adhered to the policy of exacting all which the traffic would bear years since. The trouble lies in this, that rates which gave manufacturers a living chance a decade ago are now sapping their vitality in an alarming manner. With the fierce competition which has prevailed for years, every means has been exhausted to lower costs. Those concerns who had accumulated a surplus or could command additional capital have striven to keep pace with technical progress by improving their plant and equipment. The majority have practiced the closest economy, and many have been forced to cut down wages to a low figure. The point has been reached when little or nothing can be done by the manufacturers themselves. The time has come when it rests with the managers of the railroads to act if they want to avoid the rapid destruction of large amounts of capital, and, what may appeal to them more forcibly, the withdrawal from many important communities of the means of subsistence, with the decline in remunerative local traffic which that implies.

In other parts of the country railroad managers are content to recoup themselves for hauling at cost, or even less, the large tonnage offered by iron-manufacturing and allied establishments by fair rates of freight on the supplies and merchandise consumed by the community dependant upon local industries. That has been the policy so successfully pursued by the Southern roads. Those of Eastern Pennsylvania particularly have looked more upon the freight bills paid by manufacturers than upon the income derived from supplying a large population.

It is possible that railroad managers are possessed of the idea that, through natural conditions over which neither the carrier nor the producers can exercise control in the long run, the iron industry of New York, New Jersey and Eastern Pennsylvania is doomed to the fate which overtook that of New England. They

may reason that it will pay them better to suck from it the last drop of blood while it lingers than to waive income to help it maintain a lingering, precarious existence. We know that iron-makers in other sections have boldly proclaimed that to be the fate of an industry which was once prosperous. We have in mind the dictum of a Western manufacturer who claimed that before the end of the century is reached the steel rail industry would abandon the territory east of the Allegheny Mountains. Such boasting should have no weight with well-informed men. The maligned section possesses resources which place it beyond any danger, providing it is given an equal chance.

Through the courtesy of a number of ironmasters *The Iron Age* has been enabled to present some figures showing what rates of freight are exacted on raw materials and finished products. We give below in tabulated form the length of haul, the total rate and the rate per gross ton per mile.

### Iron Ore.

93 miles, \$0.95 rate, 1.02 cents per ton per mile.  
125 miles, 1.14 rate, 0.91 cent per ton per mile.  
65 miles, 1.05 rate, 1.61 cents per ton per mile.  
351 miles, 2.70 rate, 0.77 cent per ton per mile.

### Anthracite Coal.

60 miles, \$0.90 rate, 1.50 cents per ton per mile.  
48 miles, .77 rate, 1.67 cents per ton per mile.  
140 miles, 1.81 rate, 1.29 cents per ton per mile.  
17 miles, .50 rate, 2.94 cents per ton per mile.

### Limestone.

29 miles, \$0.47 rate, 1.62 cents per ton per mile.  
44 miles, .73 rate, 1.64 cents per ton per mile.  
28 miles, .43 rate, 1.53 cents per ton per mile.  
(Return coal cars.)

### Pig Iron.

110 miles, \$1.17 rate, 1.06 cents per ton per mile.  
49 miles, .60 rate, 1.23 cents per ton per mile.  
9 miles, .30 rate, 8.33 cents per ton per mile.  
5 miles, .30 rate, 6.00 cents per ton per mile.  
45 miles, .60 rate, 1.33 cents per ton per mile.  
93 miles, .90 rate, 0.97 cent per ton per mile.  
65 miles, .90 rate, 1.33 cents per ton per mile.  
12 miles, .35 rate, 2.91 cents per ton per mile.  
113 miles, 1.25 rate, 1.11 cents per ton per mile.  
140 miles, 1.40 rate, 1.00 cents per ton per mile.  
232 miles, 2.86 rate, 1.08 cents per ton per mile.  
85 miles, 1.35 rate, 1.59 cents per ton per mile.  
100 miles, .75 rate, 0.75 cent per ton per mile.  
100 miles, .90 rate, 0.90 cent per ton per mile.

### Finished Iron.

185 miles, \$2.47 rate, 1.33 cents per ton per mile.  
93 miles, \$1.91 rate, 2.05 cents per ton per mile.  
58 miles, \$1.34 rate, 2.33 cents per ton per mile.  
128 miles, \$2.35 rate, 1.84 cents per ton per mile.  
170 miles, \$2.46 rate, 1.45 cents per ton per mile.  
52 miles, \$2.02 rate, 3.88 cents per ton per mile.  
26 miles, \$1.57 rate, 6.08 cents per ton per mile.  
20 miles, \$1.34 rate, 6.70 cents per ton per mile.  
29 miles, \$1.34 rate, 4.62 cents per ton per mile.  
250 miles, \$3.56 rate, 1.43 cents per ton per mile.  
175 miles, \$4.26 rate, 2.43 cents per ton per mile.

### Nails.

Miles.	Rate.	Per ton per mile.
49 miles, 8 cents per keg,	2.5 cents	per ton.
44 miles, 7 cents per keg,	3.0 cents	per ton.
135 miles, 10 cents per keg,	1.5 cents	per ton.
51 miles, 8 cents per keg,	3.0 cents	per ton.
37 miles, 5 cents per keg,	3.0 cents	per ton.
45 miles, 7 cents per keg,	3.0 cents	per ton.
62 miles, 10 cents per keg,	3.2 cents	per ton.
32 miles, 5 cents per keg,	3.0 cents	per ton.
126 miles, 10 cents per keg,	1.6 cents	per ton.
110 miles, 10 cents per keg,	1.8 cents	per ton.
75 miles, 10 cents per keg,	2.6 cents	per ton.

By way of contrast we give below some of the rates of freight from Birmingham and Chattanooga to the leading markets to which delivery is made by all-rail.

	Miles.	Rate.	Cent per ton per mile.
Birmingham, Cincinnati..	504	\$2.75	0.54
Birmingham, Louisville..	394	2.50	0.63
Chattanooga, Cincinnati..	335	2.25	0.64
Birmingham, Kansas City.	738	5.49	0.74

Here, then, we have a ton per mile rate which is lower by far than anything obtained in any part of the territory.

These figures, however, do not correctly measure the difference in the situation between Southern producers and Northern makers. Take a furnace in the Birmingham district. The open rate for the hauling of ore and coke, or coal, to the furnaces is 25 cents per ton within a radius

of 25 miles of Birmingham. Say that it takes 5 tons of ore, coke and limestone to make a ton of pig iron, which is liberal. Then the total freights which the ironmaster pays on all his raw material is \$1.25 per ton of product. Is there a single producer in Pennsylvania, New York or New Jersey who can show even double that figure? It is just to acknowledge that since Southern producers possess the advantage of proximity of materials they are entitled to all the benefits of it, but it will be considered just when producers in other sections demand that on long hauls of materials and on the transportation of product they be granted at least as low a rate per ton per mile as their rivals in other sections.

What can be expected of a management of a railroad like the Central of New Jersey, which in the face of the sharpest competition advances the rate from Lehigh Valley points to New England points from \$2.60 to \$3 on the 8th of April? A glance at a map will show how the distances compare between the localities named and the distance between Birmingham and Cincinnati, for which the rate is \$2.75.

The railroads commanding the territory from which Eastern iron manufacturers collect their raw material and which distribute their product must be told in the most emphatic manner that the days of bleeding a great industry are over. Unless they are prompt in doing justice, they will soon lose a business which has given them enormous revenues in the past and is still pouring very large sums into their coffers. Let any intelligent man visit the Hudson River Valley—travel along the Lehigh and the Schuylkill. He will witness signs of decay which, unless it is soon arrested, will leave among the wrecks only a few flourishing concerns, which the railroads have been unable to kill, which will live in spite of them.

The steel-rail trade surely needs every bit of encouragement which may be justly due it. For a long time no better news has been presented than the compilation, published last week by the *Engineering News*, bearing on current and prospective railroad construction east of Chicago and north of the Ohio River. It appears from the data collected by our contemporary that there are now under construction no less than 1677 miles of road, of which 426 miles are in Ohio, 392 miles in Pennsylvania, 307 miles in Indiana, 165 miles in Michigan and 152 miles in New York. When it is considered that in 1888 in all this territory the new mileage footed up to 858 miles, the progress making will be appreciated. It is true that so far as the rail mills and allied iron works are concerned, the doubling of last year's record does not amount to very much when compared with the tremendous falling off in the work west of the Mississippi River. But we know that the South is taking a good deal of construction material. Thus the *Engineering News* reports that in Kentucky 410 miles are under construction or contract. We believe that a notable feature of the work now going on throughout the country is that it is widely distributed among relatively small lines—a fact which may explain why the impression is easily created that there is less activity than is really the case.

### The Lake Superior Charcoal Pig-Iron Trade.

The winter through which we have just passed has been exceptionally mild, and as a consequence there was a remarkable absence of snow in many parts of the country. This was especially true of the greater portion of Michigan and Wisconsin. The fall of snow in that section was so light that not only were the operations of lumbermen seriously impeded, but furnacemen also found it a matter of much difficulty to secure a supply of wood at their charcoal kilns to carry them through the coming summer. Snow is essential for the economical transportation of wood any considerable distance through the forests of the North. Swamps also abound, and when they are not frozen they are practically impassable, compelling long detours by wagons, and thus greatly increasing the cost of charcoal to furnacemen who are obliged to rely upon that means of transportation in the collection of their fuel supply.

Considerable apprehension was manifested by the charcoal iron manufacturers as they saw month after month of mild weather pass by. The majority of them have contracts running over a large part of this year, and a curtailment of fuel or an advance in its cost is a matter of decided moment to them. The price of Lake Superior charcoal pig iron has also weakened to some extent in sympathy with the price of coke pig iron, and the prospect of low prices and dear fuel stretching out before the charcoal iron manufacturers is anything but pleasant. Then, again, the ore mining companies seem to have complete control of their product, and are determined to secure a better average price than they were able to get last year, so that the hope of relief in that quarter is quite slight. Unless the charcoal furnacemen are able to secure an advance on present prices, it would seem that before the approaching summer ends the old question of the survival of the fittest will again come up for practical solution. This view of the situation, of course, depends mainly upon two things: First, the maintenance of the present dullness in the iron trade, with a consequent slack demand, and, second, the deficient charcoal supply.

With regard to the former, it must be admitted that at present there is no decided indication of any change for the better. The railroads are buying cars and other supplies very sparingly, and the consumption of charcoal pig iron for car-wheels promises to be much less than normal. If other channels of consumption can be found to cover this deficiency it will be well for the manufacturers, but the probabilities are that this will not occur. With regard to the charcoal supply, we have instituted inquiries among the manufacturers in order to ascertain the exact situation at this time, since the winter is practically over and no more snow can be expected which will be of any service in hauling wood to the kilns. Replies have not been received as yet from all the furnaces, but enough information has been obtained to indicate quite a shrinkage in the tonnage of the current year as compared with the average of the past two or three years. Quite a number of furnaces will have all the fuel they need for a full year's run, either being advantageously lo-

cated for the collection of wood or having applied the most energetic efforts to secure a full supply during the short time when the weather was favorable. Some furnace companies who depend on contractors for their entire stock of charcoal regard the situation with complacency, as the anxiety about wood thus rests on others. The companies acknowledging a short supply of fuel are thus far few in number, though important in productive capacity, but more complete information will very probably swell this aggregate.

An important fact which has been brought out by our correspondence with the furnace companies is the curtailment of production to be effected this year aside from that caused by a short supply of fuel. This period of depression, slack demand and low prices will be made the opportunity to introduce improvements, remodel furnaces and accomplish other changes which would not be undertaken in a time of great activity and satisfactory profits. Several furnaces will each make from 2000 to 4000 tons less than they turned out last year. The supply may thus be reduced to the level of the demand, and even below it, in which case a reaction from prevailing low prices would not be surprising as the summer advances.

### Stimulating Our Export to South America.

On March 1, at a meeting in this city, a temporary organization was formed and a circular issued asking the co-operation of bankers, manufacturers, merchants, shippers and other interested persons in an effort to promote business with Spanish America and Brazil without Government help. The plan met with such favor that the permanent organization of an association was effected on the 29th of March with 500 New York members. The objects and aims of the new association are thus summed up: "To collect and group in convenient form facts and information relative to the national resources, means of communication, products of the soil, state of trade and finances, &c., with such practical suggestions as may be of service to our manufacturers and business men in general not having direct means of information. Also to co-operate with the members of the International Congress to the furtherance of the ends in view in such manner as may be in the power of the association, and to extend such civilities and hospitalities as are due to the representatives of those countries who take part in the proposed conference."

The movement is eminently well timed not only because it will furnish the International Congress valuable material, but because the general condition of things in South America, &c., was at no time more favorable to plans of commercial expansion in that direction. If we except Hayti, there is no revolution going on anywhere, and the high prices which coffee, sugar, wool, &c., have commanded in the world's markets for several years past have singularly enhanced the purchasing capacity of the populations down there. Brazil, the most important country, has got rid of the slavery incubus without a pang or disturbance, even without labor disorganization to speak of. Immigration is pouring into that country and the Argentine

Republic at the rate of 200,000 into each, this year. Our relations with Mexico, favored by the post-parcel convention, have received a fresh impulse. In Nicaragua we are about to commence digging a canal, which will in five years accomplish interoceanic communication, which has proved impracticable at Panama for a number of reasons which cannot hamper the American scheme. Nor is the Tehuantepec ship railway abandoned. The railways we have built in Mexico are there to testify to the value of a connection with our capitalists, and the States that are to congregate at the Congress in October are duly impressed with the importance of closer commercial ties with the Northern Republic, which in moral and material progress has been and is a beacon light to them.

The movement inaugurated is all the more promising in its scope since the Centennial was closely followed by a great and lasting impulse given to the export of domestic products. Then, as now, a feeling grew up that we should push this movement of increased exportation with energy. It was done, manufacturers and merchants taking a practical interest in the matter, and in a couple of years the value of domestic goods shipped in that direction had increased by one-quarter. At that time the movement was spontaneous, whereas now it will be a well-concerted effort under the guidance of our best men in trade and industry. Then ocean steamship communication was limited to our Mexican and Cuban trade, whereas now we ship per steamer all the way to Buenos Ayres.

We heartily approve of the movement, and wish it all the success it is entitled to. We shall conclude with noting the subjects which, in accordance with the act of Congress of May 24, 1888, are to be submitted for debate to the Congress of American Nations:

1. Measures that shall tend to preserve the peace and promote the prosperity of the several American States.
2. Measures toward the formation of an American Customs Union, under which the trade of the American nations with each other shall, so far as is possible and profitable, be promoted.
3. The establishment of regular and frequent communication between the ports of the several American States and the ports of each other.
4. The establishment of a uniform system of customs regulations in each of the independent American States to govern the mode of importation and exportation of merchandise and port dues and charges; a uniform method of determining the classification and valuation of such merchandise in the ports of each country and a uniform system of invoices, and the subject of the sanitation of ships and quarantine.
5. The adoption of a uniform system of weights and measures and laws to protect the patent rights, copyrights and trade-marks of citizens of either country in the other and for the extradition of criminals.
6. The adoption of a common silver coin, to be issued by each Government, the same to be legal tender in all commercial transactions between the citizens of the American States.
7. An agreement upon and recommendation for adoption to their respective governments of a definite plan of arbitration of all questions, disputes and differences that may now or hereafter exist between them, to the end that all difficulties and disputes between such nations may be peacefully settled and wars prevented; and
8. To consider such other subjects relating to the welfare of the several States represented

as may be presented by any of said States which are hereby invited to participate in said conference. The delegates to this conference on the part of the United States are to serve without compensation other than their actual necessary expenses.

The President has nominated the following delegates to represent the United States at the Conference of American Nations: John B. Henderson, of Missouri; Cornelius N. Bliss, of New York; William Pinckney White, of Maryland; Clement Studebaker, of Indiana; T. Jefferson Coolidge, of Massachusetts; William Henry Trescott, of South Carolina; Andrew Carnegie, of Pennsylvania; John R. G. Pitkin, of Louisiana; Morris M. Estee, of California, and J. H. Hanson, of Georgia. With such men actively identified with the proceedings important results may be expected.

### Commercial Development of Africa.

American schemes for the extension of trade with Africa have not met with that degree of success which the most sanguine had hoped for. Not many years ago a prominent New York merchant became quite enthusiastic respecting the prospects of Liberia, sending out sugar mills, encouraging coffee culture and aiding in the deportation of American negroes, but the so-called "Republic" now exists scarcely in name. In like manner a steamship project, which for a time engaged the fostering interest of several New York gentlemen philanthropically inclined, never took a tangible form, and passed out of mind. But a line of sailing vessels from New York to Liberia has been maintained, and American exports of manufactured cotton to Africa through various channels form a considerable item. Meanwhile England is building up a flourishing trade on both sides of the continent, on the West Coast and at Zanzibar. Trade with the colony of Lagos for the year 1887 amounted to \$4,500,000, and it is calculated that the entire trade of Great Britain with the West Coast last year amounted to an approximate value of \$25,000,000 of imports and \$13,000,000 of exports, comparing well with some portions of India. At Zanzibar, up to the recent breaking out of hostilities, the whole coast was a continuous line of British Indian trading stations, and trade increased rapidly to \$10,000,000 per annum, the greater part of this being in the hands of British subjects. "Unfortunately," as we are told by Archdeacon Farrar, "this property attracted the greed of certain German adventurers," who made "bogus treaties," claimed vast tracts of country and proceeded to take possession, despite the remonstrances of the Sultan. Furthermore, according to the authority just quoted, "the whole trade of the coast is in the hands of some 10,000 British subjects from India, including the ivory trade, copra, gum-copal, india-rubber, hide and grain trades. These British Indians have lent large sums of money to the Arab ivory caravans; they have also invested their profits in mortgages on the houses and plantations of the Arabs, feeling quite secure under the shadow of English justice. The British Indians have half a million sterling of floating capital employed at this time in the ivory trade in the far interior, and unless some decisive measures are taken by the English Government

this large sum must inevitably be lost." England appears to have become inextricably involved by joining in an agreement with Germany to maintain a blockade "to put down the slave trade," a feat somewhat difficult of accomplishment where every African and Arab trader is a slaveholder either in will or deed. Clearly enough, it would now appear the "development of Africa," whatever this may mean, has received a check from which there will be tardy recovery. It is surmised, however, that traders in Zanzibar, while postponing indefinitely the realization of hopes for the commercial subjugation of the interior lake regions accessible from this point, may give a new impetus to the Congo Free State and to efforts to penetrate tropical Africa through the Soudan. The marvelous achievements of Livingstone's successor, Henry M. Stanley, of whom full advices have just come to hand, invest the subject with a new interest.

The annual report of the Colorado Coal and Iron Company for the year ending December 31 says: While the results for the past year have been unsatisfactory, owing to the demoralization of railroad rates at points east of Colorado, which enabled shippers of steel, iron and coal to invade territory that naturally should be supplied from Colorado, we hope and believe that, with adjusted rates outside of this State, with improved business conditions, the change of management and economies which it is proposed to enforce, the results for the next year will be much more gratifying. The following is a condensed statement of the result of the year's operations as compared with the previous year:

	1888.	1887.
Gross earnings, including interest from investments and interest discount and exchange account.....	\$2,219,047.99	\$2,822,529.61
Cost of production and manufacture, including taxes, insurance and royalties.....	1,863,605.89	2,270,296.19
Net earnings.....	\$355,442.10	\$552,233.42
Deduct interest on bonded debt (two coupons).....	209,940.00	209,940.00
Surplus for year....	\$74,502.10	\$342,293.42
Royalties earned and charged in above expenses.....		\$96,245.39
Sales of real estate for the year amounted to.....		128,341.61

Representatives from Western Territories who are now in Washington represent that much injury results from the exclusion of foreign capital, naturally checking investment in mining property. They urge that the act passed by Congress in 1887 to restrict the ownership of real estate in the Territories to American citizens has been found to be a grave mistake so far as mining property is concerned. The reasons for the passage of the act applied entirely to agricultural lands and were based upon the fact that large areas of such lands were purchased and held by aliens, whereas the mines in the Territories are mostly situated in high mountain ranges, on land unfit for agriculture or any other use except mining. The amount of capital invested by aliens in mines in the Territories, according to the investigations of a Senate committee, amounts to \$20,573,750, and the dividends paid thereon as far as known to about \$4,737,800. It was impossible for the committee to ascertain the gross product of the mines developed by alien capital, but it reached the conclusion that the mines worked by aliens on an investment of \$20,503,000 have produced not less than \$50,000,000, the greater portion of which has been expended at home for labor, machinery, &c.

### Special Iron Freights from the South.

The Southern Railway and Steamship Association have fixed the following rates of freight on the articles named, taking effect on the 1st inst.: Iron, architectural, including columns, pedestals, capitals, plates, saddles, door and window jambs, sills and lintels, rolled beams, channel-bars and girders; bar, band, boiler and plate iron or steel, all unpacked; bolts, nuts, rivets, staples or washers, in kegs, casks or drums; bridge iron; carriage and wagon axles; carriage or wagon skeins and boxes, packed in kegs, barrels or casks, released; car wheels, axles and trucks; castings, not machinery, each piece weighing 200 pounds or over, not packed, owner's risk of breakage; chains, in casks or barrels, value limited to 2 cents per pound, and so specified in bills of lading; crow-bars; cut nails and spikes, in kegs; fence posts; fence wire; fish bars, fastenings and steel-rail braces; horse and mule shoes; jail plates, mat-tocks and picks, in bundles or barrels; pipe, cast or wrought, released; pipe fittings, in kegs, casks or barrels; pipe fittings, wired, in bundles, C.L. only; plow molds, plow plates, plow points, plow steel and plow wings; railroad iron; sad irons, in barrels or casks, released; sad irons, in boxes, contents to be plainly marked on boxes and contract to be made by the shipper that no other articles shall be put in the boxes; sash weights, unpacked; wagon tires; pig iron, L.C.L. only.

Per 100 Pounds.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., April 2, 1889.

The disaster to the American fleet at Samoa has placed before the Government and people in its baldest form the utter weakness of the nation as a naval power. The loss of the three best vessels of their class has put the Government to the worst straits to find vessels to take the place of those lost. This sudden demand has demonstrated the inefficient methods of the naval administration. The tardiness of Congress, while one cause, is not the sole reason for the delay. The four steel protected cruisers which created so much commotion when Secretary Whitney took hold of the department, after four years are in commission, but have not all received their full batteries. The Baltimore, Yorktown, Charleston and Vesuvius are afloat, but without their means of offense and no prospect of receiving them very soon. The greatest difficulty lies in the tardiness in the manufacture of the guns. The work on the vessels fixed by contract is going along satisfactorily, but without batteries they are useless to the Government. The effect of the Samoan experience will be felt when Congress again assembles. The President in his conversations on the subject has indicated his determination to recommend a comprehensive system of naval construction and coast defense, by means of floating steel batteries, torpedoes and other appliances which will place the Government on a plane with any nation on the sea, and make its security against attacks from without practically perfect.

There is no doubt whatever that the legislation of the next session of Congress, which is most likely to assemble in October in order to hasten matters affecting the navy and the revision of the tariff, will be the most important in the entire history of the Government. The stimulus given to the demand for iron and steel will quicken every branch of industry and bring the country up to the highest possible activity in production and trade. Secretary Tracy is also very emphatic in his opinions concerning the necessity of a vigorous and liberal policy concerning the rebuilding of the navy and will make that a leading feature of his recommendations to the President in his first annual message.

The work on the vessels still building will now be pushed with increased vigor. All the material to complete them is on hand. The latest reports from the Maine, building at New York, state that her keel is in place and the stern post is ready. The work of construction will, therefore, begin in earnest very shortly. The Texas, the other armored vessel, of huge size and offensive and defensive power, has not yet been commenced. The blocking, however, is ready. The specifications for the additional vessels authorized by the late Congress are being prepared. Those for the coast defense vessel are completed and bids will be received. It is not determined whether there will be any change in the standard of tests for the new vessels. The Board of Steel Inspection have completed a tabulated statement of results of tests which is being bound in manuscript. Whether it will be printed is a question for the Secretary to determine. The data at present is regarded as confidential. In a general way it can be stated from an examination of the data that the material turned out for the ships under construction is of the highest quality in physical characteristics.

The gun and armory plant of the Bethlehem Iron Works is now fairly at work. A number of 8-inch guns will soon be under way; an 8-inch tube is now being pre-

pared. The manufacture of modern guns is a slow process and the plant will, therefore, be worked to its full capacity. It was stated by a naval authority that to carry a single gun through all the stages of manufacture, from the casting of the tube to mounting ready for service, requires about a year, but that 10 guns or a number up to the full capacity of the plant would take no longer. The Department is now considering the subject of arranging a schedule of guns required by the vessels under construction, proposing to have the batteries ready as the ships are in condition to receive them. It is proposed to begin at once the manufacture of 16-inch guns.

### Electric Street Railways.

In nearly all our large cities and in many of the smaller towns electric propulsion is attracting widespread attention. Some facts of considerable interest were given not long since by George W. Mansfield, in the course of an address before the New England Club at Boston, from which we take the following:

In the year 1880 Thomas A. Edison made an early experiment of great practical value in Menlo Park. He carried on his researches to a certain extent, and then abandoned them. He demonstrated, however, its practicability. In 1888 Leo Daft, of Jersey City, made quite an important experiment on the Saratoga Railway. He had a motor of 20 horse-power made, and this he attached to any ordinary car and towed it over a mile or two on the above track, and this was the very first electrically propelled car upon a steam road. About the same time an experiment was made which was a commercial success. This was in the Chicago Exposition by Stephen Field. He used a United States machine and had a circular road constructed on which he carried 80,000 passengers. After that there were similar undertakings at different fairs throughout the country. In 1885 and 1886 there was a small motor running at the Point of Pines, at the Mechanics' Fair, and also one in New Orleans which carried 30,000 to 40,000 passengers.

From these small trials made at different fairs and with a view to interesting the world, have sprung the magnificent developments which are taking place on every hand to-day. The first railway in this country equipped for commercial purposes is said to have been at Baltimore. This was made by the Daft Company, and was put in regular service. It has been in operation continually ever since. As the electrical engineers of to-day look upon that road, only three years old, they marvel how it is possible for a system so crude and unscientific to be operated at all, for more powerful and richer companies taking hold, wonderful progress has been made. Over 300 miles of electric railways are now in regular operation or in process of construction. There are in the neighborhood of 850 to 400 cars running in daily service. Hundreds of thousands, in fact millions, of people are being carried on these cars to-day. It is almost impossible to get at the correct figures in regard to the magnitude of the business. The various companies are constructing tracks as rapidly as possible, yet they cannot keep up with the demand made upon them. The Sprague Electric Railway Company have nearly 30 contracts in hand, and are almost compelled to refuse contracts offered them. It is the same with the Thomson-Houston Company. To give you some idea of the magnitude of the business we are now considering, I would like to present you a few figures representing the number of passengers carried in this country. I was perfectly astonished myself at what I found in the way of figures. In Massachusetts

there are 67 steam railways, having a total mileage of about 5300 miles. Their passenger cars ran during the year 1887 about 15,000,000 miles, and carried 89,000,000 passengers.

Now, take the street railways of Massachusetts, and there are 44 companies instead of 67. They operate only 507 miles of road as against 5300 miles operated by the steam railway companies, and yet made a car mileage of 20,000,000 of miles through the streets, and carried 124,000,000 of passengers as against 89,000,000 carried by the steam railways. This shows that the street railways of that State do a greater passenger business and are a most important factor in our cities and towns. You cannot go into any State in the Union but you find pretty much the same condition of things existing. Unfortunately, in the Western States they do not publish railway reports as they do in the East, so it is difficult to obtain accurate figures in these matters.

Taking the United States census reports I discovered that in 1887 on 151,000 miles 269,000,000 of passengers were carried on the steam railroads of the United States. What are the reports of the business done on street railways? They show a magnitude which is almost astounding. Mr. Moody Merrill and others furnish figures which show that there 3500 miles of street railways, and they carried 1,500,000,000 passengers, so that with a vastly smaller mileage than the steam railway companies have, the street cars carried in the neighborhood of five times more passengers. It is the object, then, of the electric railway profession to so facilitate these methods of transporting the people from point to point in the various cities and towns that these figures will sink into insignificance. The Boston company alone carries over 100,000,000 annually. New York carries 225,000,000, about as many as all the steam roads in the United States. You see, then, the electrical profession has a great problem before it, and it thinks it can solve it. The next problem will be a similar one, and that is the transportation of passengers upon the present steam roads.

Coming now briefly to the different methods of applying electricity to street-car service, there are in all, fundamentally, only three. The first we may mention is the storage; secondly, the overhead system, and, thirdly, what is called the underground or conduit system. The storage battery consists essentially of a chemical battery placed on the car and charged with electricity. This electricity is chemically liberated to drive the motor. It is hardly to be believed that any form of storage battery or any form of a battery will ever be successfully applied to a very large extent to street-car propulsion. Chemistry and chemical action cannot compete with mechanical action and the consumption of coal in cheapness, positiveness and economy. In the overhead system, then, we have to fall back on the power station. We have our engine placed at one particular place; this imparts motion to the armature of the dynamo, and this motion, generating the electricity, is transmitted through the street by the overhead wire to the motors on the cars, and there is changed back to mechanical motion. We have then to transmit electrical energy, or, primarily, the steam energy, to the street cars. There is usually only one wire stretched over the street, and this may be suspended along the center or on one side, according to the location of the tracks; it makes no difference how this wire is supported. It is simply a question of mechanical ingenuity and practical expediency. In Washington the Thomson-Houston Company recently put a line of poles in the center of the street for supporting the wire. It has been a pronounced success. I have been of opinion for the last two or three years that this

method is going to be permanent. It presents fewer obstructions and is neater in appearance; on every third or fourth pole may be placed lights for illuminating the street. In Washington they have macadamized the streets, so that with the form of rail used and the line of poles in the center of the streets 120 feet apart, and lights on every other pole, you have a thoroughly scientific street. In New York City poles and wires are said to be both an obstruction and a danger. The public is against them. Could they live without them? In every town there are times when questions of aestheticism and beauty must give way to practical utility and commercial activity. The public now demands better transportation facilities. What will they tolerate for these facilities? We will do the best we can, but if mechanics and science demand the use of poles, can we not use them?

The conduit system will soon be exemplified here in this city, connecting with the Brookline overhead system. The conduit will be laid from Ipswich street up to the Providence Depot, and eventually up to Park Street Church, if not, indeed, all over the city. Both systems are thus to be practically tested. The Thomson-Houston Company are vigorously pushing the equipment of the Cambridge line with the overhead system. It will extend from Bowdoin Square to Harvard Square, Cambridge, and thence to Arlington. The production of enough electricity is a plain mechanical problem. There are stations in this country already producing 2000 and 3000 horse-power.

Now, the benefits to be derived from the application of electricity to street cars are many, and a careful examination of the matter discloses so many advantages that the wonder is how and why the electrical profession should encounter any opposition from the city aldermen or the community at large. The first benefit I might mention is the relieving of certain congested portions of the city. This is one of the most serious problems confronting every large city in the world. There are portions of every city whose people are so crowded and crammed together that crime grows apace; a stagnant pool of iniquity is formed. Project a rapid transit electric line through this locality. Take the people out into the country, illuminate the streets—must not crime cease? The question of rapid transit is also an all-important question of the day; the people want to get home quickly and comfortably. All want seats; tired nature asserts herself at 6 p.m. An electric car can be easily provided with such an abundance of power that at certain hours of the day other cars can be attached to it; and it is proposed on the Cambridge line that each one shall have sufficient power to tow two or three cars after it, so that every person will be accommodated going to or returning from the city.

Another question is the cleanliness of the cars and the streets. In New York over \$1,000,000 are annually spent in cleaning the streets, and you can readily see here in Boston that if 9000 horses can be removed the appropriation for cleansing the streets can be materially reduced. Other points are the elimination of the noise, the more pleasant means of transit, stopping the cars quickly and readily, starting promptly and without any jerking, and the saving of our sympathies. In Omaha, Neb., we have started a road nine miles long where we have introduced a new feature. There we have in operation a vestibule train in the streets. The cars are constructed by the Pullman Company and the platforms are provided with the latest vestibule arrangement, which renders traveling very comfortable. It is not too much to say that possibly the day is not far distant when there may be a dining car running on the Chestnut Hill

line and the Cambridge line, so that gentlemen working hard in the city can enjoy a little refreshment on their way home, which will be a great convenience.

And now let me say in concluding these remarks that President Whitney deserves the credit beyond any word that I can express for what he has determined to accomplish. That gentleman has investigated all the known methods of propelling street cars; he has spent tens of thousands of dollars in these investigations, and he has ultimately pinned his faith to electricity, and his faith will be proved not to have been misplaced. He is putting into the streets of Boston perhaps 15 or 20 miles of electric roads. He has now in operation altogether 212 miles; therefore he has begun on a generous and large scale a determined effort to solve this question in the interest of the traveling public of Boston. I know, too, that all the electrical engineers in Boston are putting forth every effort and are joining hands and bringing into active service all the talents and abilities that the whole electrical world can produce in aiding him. Success is positive. All praise to President Whitney. The world will thank him in years to come. For my part, I feel that the question of propelling every street car in the city of Boston is a question of a very short time. We cannot say that two or three years is a short time in electrical matters; we cannot say that one year is a long time. It is only in the neighborhood of ten years ago when the telephone was first brought out, and there is not a gentleman in this room but who has used the telephone and appreciates its value. To-day there are 150,000 miles of telephone wires strung, and men are talking from Boston to New York more easily than I am talking to you. In doing that an electric current is being used of so small an amount that electricians have as yet been unable to measure it.

There are other magnificent electrical applications now coming forward, and I do not think that any man to-day who has any acquaintance with the electrical development of the last five or ten years can say or feel, with justice to the profession and the advancement of the art, that there is any doubt or question as to the speedy solution of the problem of street-car propulsion by the electric current and electrical appliances.

A lamentable occurrence took place last week at the four-story brick factory on Kent avenue, Brooklyn, occupied by Dillmeir & Staatz as a brass foundry, Frederick Wurster, manufacturer of axles, and several others. Oil accidentally ignited, and, spreading to the stairway, the hands employed above were compelled to leap from the windows to save their lives. Several were fatally injured and one man was burned to death. John Lynagh, the building inspector whose duty it was to see that there were fire-escapes on the burned building, and who neglected that duty, says in self-vindication: "I being engaged in the yearly examination of public buildings, factories, &c., and my district being a large one, I failed to reach the building burned on the 26th inst., but I had already made memoranda of the same for an inspection to be made the latter part of this week." The inspector, unfortunately, was too late.

It is stated that a traveling electric light has come into use in Germany. It somewhat resembles the steam fire engine, the tank, boiler, engine and dynamo being mounted upon a wagon, which can be drawn by a team of horses to any desired location. When the apparatus reaches its destination, arc lamps are raised upon poles stayed with wires fastened to stakes driven in the ground. The whole plant is simple, and stated to work satisfactorily.

### Fluctuations in the Gauge of Plates.

Modern requirements for ship and boiler purposes often call for heavy plates; with them the fluctuations in the thickness are often greater than with ordinary plates. In order to secure accurate data on the extent of these variations three German plate mills, Schulz-Knauddt, of Essen; Grillo, Funke & Co., of Schalke; and Fried. Krupp, of Essen, made a series of measurements. The thickness was calipered as close to the edge as possible at a number of points. The weight was used to calculate the thickness, using 7.76 as the specific gravity. The following table gives the results:

#### Gewerkschaft Schulz-Knauddt, Essen.

It will be observed that the variations are considerable. Our contemporary, *Stahl und Eisen*, adds that they often astonished the managers and engineers of the works

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., April 2, 1889.

The first quarter of 1889 has been a very trying time to the Iron trade, and, although prices show some slight tendency to react from the lowest, they are, nevertheless, from 50¢ to \$1 lower in Pig Iron and from \$2 to \$3 on Finished Iron than they were during the corresponding week three months ago. The volume of business has been large, but competition with Pig-Iron makers in the South and with Steel manufacturers in Pittsburgh, has kept prices weak continually, and it is not yet clear that the turning point has been reached. The increase in capacity for production seems to be the chief cause of the unprofitable condition of business, so that an improvement can only be the result either of a curtailment in the output or an increase in the demand. The former alternative has been forced upon some, and it is hoped that the latter will do the rest. Matters are two unsettled to warrant very positive predictions for the near future, although it will be contrary to former experience if an improvement does not come within the next few weeks. Many well-informed persons think it will be both sudden and decisive; a start is all that is required.

**Pig Iron.**—No change can be noted in this department. The demand is sluggish, but the supply appears to be steadily absorbed, and there is more pressure to realize to-day than there was three or four weeks ago. Prices average about the same, although there are instances in which slight advances have been paid, while in other cases buyers have had the advantage. Price depends a good deal on what the Iron is and what the buyer wants. To offer a new brand, or a brand not in favor, means concessions from quoted rates, while an inquiry for quotations on standard qualities is at once met with a firm response. There is nothing in sight at present to indicate any change in the position, although very little would do it. An increase in the demand would be likely to develop a firmer market at once, while on the other hand a pressure to realize would just as quickly have the opposite effect. It is impossible to say which of these influences will be developed, although the chances seem to favor the former alternative. Prices are already much below what they ought to be, foreign markets are steadily advancing, and the season is at hand when consumption ought to be at its maximum, so that, with favorable crop prospects and a sound financial position, it is not unreasonable to expect a better market in the near future. Nevertheless, the trade are very conservative. Recent experience has shown consumers that they have not lost anything by taking small lots, and until their requirements increase it is hardly likely that they will take larger lots. Sellers are very much in the same position. Sales made in January were on better terms than could have been secured later on, but there is no certainty that sales of large lots for such prices as could be realized to-day would be equally satisfactory a month or six weeks hence. This feeling decides both parties to sail close to the wind, so that the turn, whenever it comes and whatever direction it takes, is likely to be a very decided one. As to prices, sales of No. 1 Pennsylvania Irons are reported at all the way from \$17.50 to \$18.50; No. 2 at \$16.50 @ \$17, and Gray Forge at \$15 @ \$15.75, all tide-water deliveries, price according to brand, &c. Southern Irons are not selling very freely, although offered at from 50¢

to 75¢ below the local brands. The truth is that buyers are not inclined to take hold, and as efforts to push sales would be likely to weaken the market without increasing the volume of business holders are inclined to wait until satisfactory bids are presented for their consideration.

**Blooms.**—There is the usual movement in Blooms, and without change in prices. Sales are chiefly at quotations about as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 @ "Bloom" ton of 2464 lb.

**Muck Bars.**—A better demand has been met with during the past week, but no great amount of business done, as sellers' ideas are a little beyond what buyers are prepared to pay. Asking prices are from \$27 to \$27.50, delivered, for good Bars, with buyers at not much over \$26.50 for good-sized lots.

**Bar Iron.**—Business is extremely dull, with prices about as low as they have been at any time during the recent depression. There is a fair jobbing trade, but no demand for large lots, so that none of the mills are running more than from a half to two-thirds of their capacity. The prospect is not encouraging for an immediate improvement, although manufacturers are still hoping for a turn in their favor. There should be a good demand at this season, but there are so many on the lookout for new business that prices hardly have a chance to stiffen. It is impossible to quote such a market with strict accuracy, but from 1.70¢ to 1.80¢ seems to be both top and bottom, varying according to size of order, specification, &c. Skelp Iron is nominally about 1.75¢ for Grooved and 1.85¢ for Sheared, but there is no demand of any account at present.

**Plate and Tank Material.**—Business is not active by any means, but mills are all fairly employed for the present. Prices are very weak, however, and it seems impossible to secure orders of any size without cutting prices; in some descriptions a half-tenth, and in higher qualities a tenth, and sometimes more than that. The fact is, the market is drifting along in a most unsatisfactory condition, and it is impossible to say how long or how short a time it will so continue. Prospects are favorable as regards the volume of business, however, and ultimately that, of course, will have its effect upon prices. Meanwhile, quotations are nominally as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 3¾¢.

**Structural Material.**—Nothing very important has been placed on the market within the past few days, but it is understood that a large amount work has been virtually agreed upon. The material may not be wanted immediately, but the business is definitely in sight, so that the feeling is more hopeful than in some other departments of the Iron trade. Prices are very irregular, nevertheless, and cuts in Angles appear to be the rule rather than the exception when the order is desirable as to size or specification. Nominal rates are as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—Business is not what it ought to be at this season, although specialties are in good demand. The ordinary demand, however, is disappointing, notwithstanding the fact that some of the

mills are running full in anticipation of a better market later on. Prices are usually about as follows:

Best Refined, Nos. 14 to 20. .... 3¢  
Best Refined, Nos. 21 to 24. .... 3.20¢  
Best Refined, Nos. 25 to 26. .... 3.40¢  
Best Refined, No. 27. .... 3.50¢  
Best Refined, No. 28. .... 3.60¢  
Common, ¼¢ less than the above.  
Best Soft Steel, Nos. 14 to 20. .... 3½¢  
Best Soft Steel, Nos. 21 to 24. .... 3¾¢  
Best Soft Steel, Nos. 25 to 26. .... 3¾¢  
Best Soft Steel, No. 27. .... 4¢  
Best Bloom Sheets, ¼¢ extra over the above prices.  
Best Bloom, Galvanized, discount. .... .65 %  
Common, discount. .... .67½ %

**Steel Rails.**—There is a remarkable sameness in reports from week to week. Prices are maintained at about \$28, at mill, and, while no large orders are taken, the mills seem to be fairly busy on such business as comes to hand from day to day. The impression is that the market will be better, and that prices will be higher before many weeks are over, as a great deal of business is likely to be on the market before midsummer.

**Crop Ends.**—There is some inquiry for foreign Crops, but prices appear to be too high to permit of business being done. Domestic Crops are offered at \$19 @ \$20, at mill; foreign, \$22 @ \$25 asked, according to analysis.

**Old Rails.**—There is very little demand, but the scarcity of spot lots enables holders to maintain their prices. Buyers talk about \$23 for T's, with sellers at \$24 @ \$24.50 for lots delivered in consumers' yards. No sales have been made in this market for some time past, quotations at other points being more favorable to buyers.

**Scrap Iron.**—There is a moderate movement at interior points, but prices are easier, and to effect sales concessions would have to be made. Prices nominally as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The market has a better appearance, and prices are well maintained. Discounts about as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

**Nails.**—The same monotonous report must be repeated, prices irregular and unsatisfactory, although the demand is improving. A meeting of the association is to be held on Thursday, when it is hoped that measures will be adopted to secure legitimate prices for Nails.

## Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, April 1, 1889.

The passage of the first quarter of the year has brought with it no promise of the speedy recovery of the Iron trade of this section from its depression. At times during the past three months decided activity has been witnessed in nearly every branch, but the movement was only spasmodic, being followed by a relapse into dullness which seemed more profound in contrast with the brief season of animation. Prices are at cost or below it with respect to most commodities, and the hope of an advance is but slight, even with the most sanguine, so long as present conditions prevail. Railroads are economizing in their purchase of supplies more than ever before in their history, and as this is the headquarters of more large railroad systems than any other city in the country, the effects of their enforced economy are more

severely felt here than elsewhere. The railroad situation must improve, and that very decidedly, to restore the Iron trade of this district to its normal condition. The second quarter of the year opens with very gloomy prospects for those who are struggling with high costs, low prices and narrowing channels of consumption.

**Pig Iron.**—Dealers generally found the past week very quiet, but few sales being reported, and those mainly to country consumers. Among the sales were included a considerable quantity of Soft Iron and some Lake Superior Charcoal, but local Coke Iron keeps in the lead. Prices are not firmly maintained, the supply being much in excess of the demand, and it seems absolutely necessary that the production should be speedily curtailed if makers do not wish to see prices on a still lower plane. Cash quotations are about as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, \$17 @ \$17.50; Bay View Scotch, \$16.50 @ \$17; Lake Superior Charcoal, all numbers, \$19.50; American Scotch (Blackband), No. 1, \$18 @ \$19; Jackson County Silvery, No. 1, \$18 @ \$18.25; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$16.25 @ \$16.75; No. 2 Foundry and No. 1 Soft, \$15.75 @ \$16; No. 3 Foundry, \$15 @ \$15.50; Gray Forge and No. 2 Soft, \$14.50 @ \$14.75; Tennessee Charcoal, No. 1, \$19.

**Bar Iron.**—Bids have been asked on Car Iron to some extent, and consumers generally have purchased small quantities of Iron, but there has been no approach to anything like activity. Some of the mills have been able to get good prices on guaranteed Iron, for delivery during the summer, but in other respects there has been no change, mill lots of Common Iron being still quoted at 1.60¢ @ 1.65¢, half extras, f.o.b. Chicago. Small lots are sold from store at 1.80¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—Orders for Beams are increasing in volume, and the advance of the building season is also bringing a demand for Plates and Angles to be used in structural work, but bridge material is not called for to any extent. Mill lots are quoted as follows, f.o.b. Chicago: Angles, 2.15¢ @ 2.25¢; Sheared and Universal Plates, 2.20¢ @ 2.30¢; Tees, 2.55¢; Beams and Channels, 2.90¢. Small lots from store are quoted as follows: Angles, 2.80¢ @ 2.50¢; Tees, 2.75¢; Beams and Channels, 3¢ @ 3.40¢.

**Plates, Tubes, &c.**—A quiet week is reported in this branch, with no orders in the market of any notable magnitude. The active trade of the previous weeks, however, made the result for the month exceedingly good, notwithstanding the dullness of the closing days. Store quotations are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; No. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 65 % off for 3 inch and over, 62½ % off for 2 to 2½ inch, and 57½ % off for 1½ inch and smaller.

**Sheet Iron.**—The mills still seem to be very loth to take orders for summer delivery, but quote about 2.90¢, f.o.b. Chicago, for No. 27 Common, immediate shipment. The call for small lots from store is very light, with quotations of No. 27 at 3.10¢ @ 3.20¢.

**Galvanized Iron.**—Manufacturers' agents report March one of the heaviest months they have ever had, their sales far exceeding those of March, 1888. The rush is about over, however, the demand for mill lots and for small lots from store

having been limited in the past few days. Small lots still sell at 65 % off for Juniata and 65 % and 2½ % off for Charcoal.

**Merchant Steel.**—A continued improvement is noticeable in this line, but only in a retail way. No heavy transactions are reported, and no large orders are in sight, but the character of the trade indicates a general stocking up throughout the section of country drawing supplies from this city. Quotations are about as follows: Soft Steel Bars, 2.20¢ rates; Tool Steel, 7.75¢ @ 8.50¢; Tire Steel, 2.25¢; Open-Hearth Machinery Steel, 2.40¢; Open-Hearth Spring Steel, 2.50¢; Crucible Spring Steel, 3.75¢; Sheet Steel, 7¢, 8¢ and 10¢, according to grade.

**Steel Rails.**—Very little new business was booked during the past week. The South Chicago Works will shut down this week for slight repairs, to be started up again as quickly as that work is completed. Prices are unchanged from the old rate of \$30 @ \$30.50.

**Old Rails and Wheels.**—A number of transactions in Old Iron Rails are reported at \$20.25 @ \$20.50, Chicago, but the bulk of sales was for delivery at other points than this city. Prices are weaker, and \$20 is now a fair quotation. The demand for Old Steel Rails keeps pace with the supply, and lengths suitable for slitting maintain a value of about \$19. Old Car-Wheels are becoming plentiful, and considerable quantities are now offered for sale, but are not being pressed, holders asking \$18.50 @ \$19 for them.

**Scrap.**—The stock of Mill Iron here was pretty well cleaned up by a large consumer last week. Cast Iron was also in better demand than had been the case for several weeks. Forge Iron is utterly lifeless, and some dealers assert that if it was offered at \$18 consumers would not take it. Dealers are still paying \$18 for Mixed Country Scrap. Carefully Selected is quoted to consumers as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$18.50 @ \$19; Track, \$18.50 @ \$19; Fish Plates, \$20 @ \$21; Axles, \$24; Horseshoes, \$18.50; No. 1 Mill, \$13.50 @ \$14; Pipes and Tubes, \$13 @ \$14; Light Iron, \$9; Cast Machinery, \$13; Stove Plate, \$10; Cast Borings, \$8.50; Wrought Turnings, \$11.50; Axle Turnings, \$13 @ \$14; Mixed Steel, \$11.50; Coil and Leaf Steel, \$14; Tires, \$15.

**Nails.**—Something of a sensation has been caused by the wide distribution of a circular put forth by the Jefferson Iron Works, of Steubenville, Ohio, quoting the following prices for factory lots of Steel Nails:

Assortment running 20¢ above base, \$1.85 rates at factory.  
Ditto, 21¢ @ 80¢, \$1.80 rates at factory.  
Ditto, 31¢ @ 40¢, \$1.75 rates at factory.  
Ditto, 41¢ @ 50¢, \$1.70 rates at factory.  
Ditto, 51¢ @ 60¢, \$1.65 rates at factory.  
Ditto, 61¢ @ 70¢, \$1.60 rates at factory.  
Ditto, 71¢ @ 80¢, \$1.55 rates at factory.  
Ditto, 81¢ and upward, \$1.50 rates at factory.

This is a heavy cut in extras, and will call for decisive action on the part of the other manufacturers. The next meeting of the Western Nail Association will probably be very interesting to the participants. Jobbers are still selling Steel Nails at \$2 for small lots and \$1.95 for carloads; Wire Nails, \$2.40 for small lots and \$2.35 for carloads, but these prices are occasionally shaded.

**General Hardware.**—Last week was the heaviest of the year thus far in Shelf Hardware, with trade apparently on the increase. The month of March was remarkably good with all the houses here, so far as the volume of business would make it good, but jobbers have been obliged to sell on very close margins. In Steel Goods particularly competition has been very active, and it is stated that jobbers along the Mississippi have reduced their quota-

tions to manufacturers' discounts, having evidently stocked up too heavily. An extraordinary demand is noted for Bicycles, especially safety machines, some houses being from two to three weeks behind their orders in consequence of the inability of manufacturers to deliver them fast enough. In staple goods there is an increasing disposition by manufacturers to curtail production with a view to getting better prices. Heavy Hardware is in better demand than it was at the same time last year, but prices are lower of course and margins are smaller, except for Wood stock, which holds up very firmly on account of the diminishing supply of hardwood.

**Barb Wire.**—The improved tone which was noted last week is maintained. Jobbers quote Painted at 2.80¢ for small lots, with 60¢ @ 65¢ per 100 lb advance for Galvanized.

**Pig Lead.**—Dealers report light business but a large inquiry, with quotations at 3.45¢ for carloads. At the close 3.40¢ is bid for spot and April delivery, with 3.45¢ asked, and 3.45¢ bid for May, with 3.50¢ asked.

W. S. Mallory & Co., dealers in Plate Iron and Steel, have removed from No. 22 West Randolph street to No. 7. Their new office will give them much better facilities for handling their increasing trade and is also in close proximity to their warehouse.

John McLaughlan, manager of the Chicago office of the Andrews Brothers Company, has issued a circular calling attention to the special qualities of the Haselton Scotch Pig Iron made by that company at their furnaces near Youngstown, Ohio. A unique feature of the circular is the word "Haselton," printed on the margin, with each letter apparently composed of pieces of Pig Iron artistically disposed and engraved. The company's works now have a capacity of 150 tons of Finished Iron a day. This summer their furnaces will be completely remodeled and brought up to the latest practice.

## St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,  
St. Louis, April 1, 1889.

**Pig Iron.**—There is hardly any business doing at the present writing. Occasionally sales are made amounting to between 100 and 200 tons, but large buyers seem to be out of the market, for the present at least. The various industries that are naturally associated with the Iron trade, such as machine shops, stove foundries, pipe mills, &c., are all pretty well filled up with orders, but they are either holding off with the expectation of lower figures in the near future or are supplying their needs from hand-to-mouth with the same end in view, and do not appear anxious as to the ultimate outcome. Several lots of No. 2 Southern Coke Foundry were taken during the past week at about \$15, delivered. We quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry,	\$15.50 @ \$16.00
Southern Coke, No. 2 Foundry,	15.00 @ 15.25
Southern Coke, No. 3 Foundry,	14.50 @ 14.75
Gray Forge.....	13.50 @ 14.00
Ohio Softeners.....	18.00 @ 20.00
Lake Superior Charcoal.....	21.00 @ 21.50

### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

### Tennessee.

Charcoal Foundry, No. 1.....	17.50 @ 18.50
Charcoal Foundry, No. 2.....	16.75 @ 17.50

Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

**Bar Iron.**—The remarks made last week in reference to this department hold good to-day. The volume of business continues

large, but prices are very unsatisfactory and there is nothing in the immediate future that justifies any improvement. Lots from store are quoted at \$1.80; carload lots from \$1.65 to \$1.75, according to circumstances.

**Barb Wire.**—There is a steady increase in the volume of business during the past week, and manufacturers are kept busy keeping up with the demand. The market has steadied to some extent, and although prices are commonly reported as being demoralized, yet the bids made by buyers are nearer to the sellers' figures than they have been for some time. Mills quote as follows for carload lots: Two and Four Point Painted, \$2.80; Two and Four Point Galvanized, \$3.40, f.o.b. St. Louis. Less than carload lots, 5¢ additional.

A. P. De Camp & Co., Laclede Building, St. Louis, Mo., have been appointed sole agents in the West for Rising Fawn and Chattanooga Southern Coke brands.

Rogers, Meacham & Shields, Laclede Building, St. Louis, Mo., have the agency in this territory for the sale of the Irving brand of Foundry Iron manufactured by Mayville Furnace, Mayville, Wis.

## Louisville.

LOUISVILLE, KY., April 1, 1889.

**Pig Iron.**—The market has been more active this week than for some time past. Inquiries have been numerous and several good sales have been made. Prices are firmer and show a slight increase. Furnaces do not seem inclined to take orders for very long deliveries at present prices, and there seems to be a much better feeling among them. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
" " No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 23.75

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. (CINCINNATI, April 1, 1889.)

**Pig Iron.**—The local market for Pig Iron has changed but little during the past week. The volume of business has been light, but prices have not changed essentially. Buyers, who a few weeks ago were anxious to complete contracts for several months in the future, are now holding off in anticipation of lower prices or some advantage in time of delivery. At the same time, sellers are not pressing iron, and are not making figures below the present level, at least not openly, although sellers of Ohio Iron draw information from the trade that the Southern product is being sold at lower prices. Car-Wheel Iron, more especially the Southern output, is quiet and the higher numbers are accumulating. Lake Superior Car-Wheel is meeting with more favor, and some sales to Springfield are reported at very low prices on four months' time. One sale of Gray Forge of about 750 tons is reported at \$13.25, cash. Foundry grades are in moderate supply and relatively stronger than Forge Iron. Regarding the output it is claimed that the new furnaces to blow in and the old ones to resume operations will provide about an equal amount of iron as the stacks blowing out have made, so that there is no immediate prospect of any essential change in the amount of iron

to be disposed of in this section. The following are the approximate prices current here at the close, for cash, f.o.b.:

### Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	13.75 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

### Forge.

Strong Neutral Coke.....	13.25 @ 13.50
Mottled Neutral Coke.....	12.25 @ 12.75
Gray Forge.....	13.00 @ 13.50

### Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

**Manufactured Iron.**—The demand for all kinds of Manufactured Iron has been light and an easy tone has prevailed.

**Nails.**—The market has remained steady with a fair demand in a jobbing way; 12d @ 40d sell at \$1.95 @ \$2 ½ keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.80 ½ keg.

**Old Material.**—There have been moderate offerings of Old Rails at \$20.50 @ \$21, cash, but little demand. Old Wheels have been offered at \$18 @ \$18.50 ½ ton, but dull.

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave. (PITTSBURGH, April 2, 1889.)

It was expected that March would show an improvement on February in general business, but this expectation was not realized; there is not much doubt, however, that April will show an improvement on March, although it may not come up to the expectations of the more sanguine. There is always an increased demand in April, not only for Iron and Steel, but for all kinds of manufactured goods. Architects report that they have all and more than they can do; that there will be more improvements made in this city than for a number of years past, despite an oppressive taxation, and reports from various points West and South are of a similar character. One of the effects of the oppressive taxation noted is to cause a great many manufacturers to move their works outside of the city limits and new firms to locate outside.

The river Coal trade continues in an exceedingly depressed condition, the markets below being overstocked, and it looks now as if nearly all the river Coal works, employing some 6000 miners, would be idle within the next week or two. Some of the Westinghouse plants, it is said, will shortly work their men only eight hours a day and four days a week. The Chicago Steel Rail manufacturers are reported as having closed contracts within the past few days for 700,000 tons of Bessemer Ore, at \$5.50 ½ ton, delivered at Lake ports. While Chicago has the advantage of Pittsburgh in cheaper transportation in Ores, being so much nearer the Lake Superior Ore fields, Pittsburgh still has the advantage of cheaper fuel, which more than overcomes the former. It is claimed that Chicago will never be a very formidable competitor of Pittsburgh in the way of manufactured goods.

**Pig Iron.**—There has been no perceptible change in the situation during the past week; trade continues very dull; there is not the business there was a few weeks ago, and the market is weaker. While most, if not all, of the city furnaces

are well sold up and are indifferent about making additional contracts, there is said to be considerable offering here from the Mahoning and Shenango valleys, notwithstanding it was claimed a few weeks ago that furnacemen out there could do better at home than in this market. Production is being reduced, as we hear every now and again of furnaces blowing out, some for repairs and others to wait for a better market. So far as relates to furnacemen, not for several years has the market been in a more unsatisfactory condition than at present. We quote prices as follows.

Neutral Gray Forge.....	\$14.25 @ \$14.50, cash
All-Ore Mill.....	15.50 @ 16.00, "
White and Mottled.....	13.50 @ 14.00, "
No. 1 Foundry.....	16.25 @ 16.50, "
No. 2 Foundry.....	15.50 @ 16.00, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.50 @ 22.00, "
Cold Blast Charcoal.....	25.00 @ 25.00, "
Bessemer Iron.....	16.50 @ 16.75, "

Both Forge and Mill Irons have gone off 25¢ ½ ton within the past two weeks.

**Muck Bar.**—Continues dull, but there has been no notable change in prices; for immediate delivery, \$26.50 @ \$27. Sale of 1000 tons for May at \$27, cash.

**Ferromanganese.**—Sales of several lots reported at \$59.50 for 80 %; Spiegel is still quoted at \$29 @ \$30 for 20 %.

**Manufactured Iron.**—Regular Merchant Iron does not improve much; demand continues very light for this season of the year, and prices unsettled and unsatisfactory. First quality Iron is quoted at 1.65¢ @ 1.70¢ rates for Bars, 60 days, 2 % off for cash; Old Rail Iron is said to be offering at 1.50¢ rates, but a great many buyers, especially those having a regard for quality, prefer to pay the difference for the former. Skelp Iron is still quoted at 1.65¢ for Grooved, and 1.90¢ @ 1.95¢ for Sheared. There is not the demand usual at this particular time for several years past, but it will doubtless improve as the season becomes more advanced.

**Nails.**—The Nail trade continues as dull as ever, and there does not appear to be much prospect of any immediate improvement. There appears to be no demand, and manufacturers here, notwithstanding this is usually the busy season, are doing next to nothing, and reports from Wheeling are of a similar character. A few large contracts were made early in the present year, but since then there has been scarcely anything done. Demand chiefly of a local character for small lots. Card rates are being maintained, and we continue to quote 12d to 40d \$1.90, 60 days, 2 % off for cash.

**Old Rails.**—There have been no sales since last report, in absence of which we continue to quote American Tees at \$23 @ \$23.50, cash. Brokers report but very few offerings, and with any demand the market, it is generally believed, would soon stiffen. We can report a sale of 500 tons Old Steel Rails at \$19, cash, for long lengths.

**Wrought Iron Pipe.**—There is a fair business. This is about the time the Pipe trade commences to open up, and it is expected that orders will be offering more freely within the next week or two. So far as we can learn, the rates agreed upon at the meeting in New York two weeks ago are being faithfully adhered to; the meeting showed good sense in putting prices at a point where they could not be cut and afford a margin for profit; however, the great point was to have them uniform and thereby avoid a good deal of confusion and bad blood. Discounts on Black Butt Pipe 55 %; Galvanized do., 47½ %; Black Lap-Welded, 67½ %; Galvanized do., 55 %; Boiler Pipes, 62½ %; Casing, all sizes, 62½ %; Two-inch Tubing, 13¢ ½ foot, net.

**Steel Rails.**—Heavy sections are still being quoted at \$28 for small lots, but

large orders are being placed for considerably less. The new mill of the Allegheny Bessemer Steel Company, recently started up, is reported as doing good work.

**Billets, Blooms, &c.**—Bessemer Steel Blooms and Billets are quoted at \$27 @ \$27.50, cash, according to size, quality and delivery. Nail Slabs are quoted at \$27, with very little demand. Domestic Bloom and Crop Ends, \$18, at which last sale was reported. There has been considerable inquiry of late for Bloom Ends.

**Railway Track Supplies.**—No change in prices. Spikes, 2¢, 30 days, free on cars, Pittsburgh. Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square, and 2.85¢ with Hexagon Nuts.

**Old Material.**—Demand continues light, prices weak. No. 1 Wrought Scrap, \$19 @ \$19.50, ½ net ton; Wrought Turnings, \$18 @ \$18.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross ton; Old Car-Wheels, \$19; Cast Borings, \$11 @ \$12, gross ton.

S. P. S. Ellis, for a number of years with the Cambria Iron Company, Johnstown, Pa., has returned to Pittsburgh, and is now located in the Penn Building, in that city. Mr. Ellis is the Pittsburgh representative of the Johnson Company, and also of A. J. Haws & Son, manufacturers of Haws' Fire Brick and Silica Brick, of Johnstown, Pa. In addition to this, he will carry on a general brokerage business in Iron and Steel of all descriptions.

The Pittsburgh office of the National Tube Works Company, which is located in the Monongahela House, will shortly be removed to the top story of the Lewis Block, at the corner of Sixth avenue and Smithfield street, in that city, and will occupy the entire floor.

## Cleveland.

CLEVELAND, April 1, 1889.

**Iron Ore.**—All of the new features of the market are in accord with the trend of events as outlined in these quotations during the past six or eight weeks. The Ore men are again forcing the vesselmen into line, and are obtaining charters from Escanaba to Ohio ports at \$1, and from Two Harbors and Ashland at \$1.25; high-grade Bessemer Ores are in demand at \$5.75 ½ ton, f.o.b. vessels at Lake Erie ports. Gogebic Bessemer will be placed upon the market at \$5.25, with high-grade non-Bessemer Ores, from all ranges, quoted at \$4.15 @ \$4.25. These prices do not vary materially from those of last year, with, however, the cost of transportation considerably reduced. The total amount of Ore that has been sold for Chicago delivery probably aggregates 900,000 tons. Considerable non-Bessemer Hematite Ore is reported to have been sold for far-Eastern furnaces at \$4.25, f.o.b. vessels, Buffalo. The purchases of Vermillion Ore for the same furnaces probably exceed 300,000 tons at prices not far from \$5.75 at Buffalo. While the furnacemen who receive their Ores via Cleveland, Fairport and Ashtabula have not as yet made heavy purchases, they are interested in negotiations for round lots of Republic and Champion Ores at about \$5.75, and Menominee Range Ores at \$5.10 @ \$5.20.

**Pig Iron.**—Bessemer Iron is in good demand, but the market generally does not retain the feeling of firmness that has characterized it for several weeks. Foundry Irons are almost out of the market, and although Mill Iron is in better favor the inquiry for it is limited. There is no apprehension of lower prices, but the fear is expressed that the revival hoped for by April 1 may be delayed until May. The

general condition of the market is represented in the following quotations:

No. 1 to 6 Lake Superior Charcoal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer quality, ½ ton.....	17.00 @ 17.50
No. 1 Strong Foundry, ½ ton.....	16.00 @ 17.00
No. 2 Strong Foundry, ½ ton.....	15.00 @ 16.00
No. 1 American Scotch, ½ ton.....	17.00 @ 18.00
No. 2 American Scotch, ½ ton.....	16.00 @ 17.00
No. 1 Soft Silvery, ½ ton.....	17.00 @ 18.00
Mahoning and Shenango Valley Neutral Mill Irons, ½ ton.....	14.00 @ 15.00
Mahoning and Shenango Valley Red Short Mills, ½ ton.....	14.50 @ 15.50

**Manufactured Iron.**—The market is firm, with prices somewhat improved. Common Bar Iron at 1.60¢ is in good demand, and Sheets are strong at \$2.75 for No. 24 as a basis for quotations.

**Old Rails.**—An active buying movement has characterized the market during the past week, Old American Rails bringing \$22.50 readily. There is some demand for Wheels at \$19 @ \$19.25.

(Later, by Telegraph.)

Eastern furnacemen are buying liberally of non-Bessemer Ores, at about \$4.15, f.o.b. vessels Buffalo. Menominee range Bessemer are reported to have sold to-day at \$5.10 @ \$5.20, f.o.b. vessels at Lake Erie ports. Additional sales of high grade Bessemer at \$5.75 have occurred this week. Just now there is a large demand for non-Bessemer at prices ranging from \$4.10 to \$4.25. A dozen charters, based upon \$1 rate from Escanaba, are reported to-day.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, April 1, 1889.

**Pig Iron.**—The present status of the market is practically unchanged, and everything appears to be working smoothly and in about the same groove that it has been for the past few weeks. So far, as to the feeling expressed by the Southern producers, there does not appear to be much concern manifested as to the future, as it appears to be an opinion that the future, so far as they are concerned, will take care of itself. Sales are being made right along at prices that they deem somewhat remunerative, and any addition to the prices they get is so much gain. As a fair condition of the market, we note the sale of 1250 tons No. 2 Foundry to New York at \$17, delivered, which nets the furnace \$13.25 cash, or say \$13, after taking off commissions. While all the Iron sold in that market will not come up to that figure, the only concessions that are being made are in consequence of inferior grades and Irons that are not so well known. At the prices that are now ruling nearly all the furnaces are keeping their yards well cleaned up, and as a general thing are not extending as long credits to their customers as they did a few months ago; their expenses are also being cut down to a considerable extent, all of which goes to lessen their expense account to a very great extent. With the exception of the stacks that are out for repairs, all are at work to their utmost capacity; and as an index of the feeling as to the future there are no cessations in the construction and pushing ahead of the new plants that have been inaugurated nor of those that are being built

## Detroit.

WILLIAM F. JARVIS & Co., under date of April 1, 1889, report as follows: The market has been more active during the week under review than for some time past, and a number of orders for round lots have been booked. The Lake Superior Charcoal trade has been especially lively, and several large concerns have purchased who do not usually place orders until later in the season. There seems to be a growing impression among consumers

that those who place orders early will obtain the most favorable terms and lowest prices, and sellers anticipate a large amount of buying in April. While the demand for Coke Irons has not been so large as for Lake Superior Charcoal, yet it has shown more strength than recently. We are able to report a satisfactory trade, with prices ruling about as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.75 @ 19.25
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.75 @ 19.25
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

## New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, April 3, 1889.

**American Pig.**—The market is very quiet, with only a moderate hand-to-mouth business progressing. Some Southern Iron is again pressed for sale, and reports of low figures are current. We have been unable, however, to learn of any transactions at the figures named. We quote for standard Northern brands, tidewater delivery, \$17.50 @ \$18 for No. 1 Foundry; \$16.25 @ \$17 for No. 2 Foundry, and \$15 @ \$15.50 for Gray Forge. Southern Foundry Irons are from 50¢ to \$1 lower.

**Ferromanganese.**—There is some business at \$57 @ \$57.50 for Foreign 80 %.

**Structural Iron.**—It is stated that the Brooklyn Elevated work taken two weeks since aggregates about 10,000 tons, and was taken by an Eastern Pennsylvania beam mill and a bridge works, operating together. The James River Bridge, calling for about 1000 tons of Iron, was secured by an Eastern Pennsylvania works. A lot of 1500 tons of Beams for a store building on Broadway was taken by a local architectural concern, the low bid being accepted with the understanding that Steel Beams could be used. There are coming up in the near future three large new office buildings in this city. We quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

**Bar Iron.**—We quote: Carload lots on dock, half extras, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Steel Rails.**—The market is moderately active and steady. We are reported sales of 3000 tons to an Eastern road, 8000 tons to the Southwest, 3000 tons to Arizona, and a round block taken by the Chicago mills, for St. Paul delivery, for a new Northwestern enterprise. Three of the Eastern mills competed for this order, being able to make Duluth delivery, which they had the option to do, at a shade over \$30. The Board of Control has increased the allotment by 200,000 tons, the basis of percentage being the same as that for the first allotment. So far as we can learn the first allotment, which some of the mills did not avail themselves of, has not yet been distributed among the other mills, which it was understood was the agreement. We quote \$27 @ \$27.50, at Eastern mill, for large blocks.

**Scrap Iron.**—The inquiry for Scrap continues very light and little business is being done. Prices remain firm at about last week's quotations, which we repeat: No. 1 Scrap, \$20.50 @ \$21, for carload lots, delivered; Turnings, \$18 @ \$14, for cargo lots, do.; Cast Scrap, \$15.50 @ \$16, do., and Horseshoes, \$23 @ \$23.50.

**Billets.**—It is rumored that a sale of considerable magnitude of Wire Billets has been closed by an Eastern Rail mill.

**Wire Rods.**—The market is dull for Foreign Wire Rods, with prices nominally \$41.25 @ \$41.50. Reports from abroad are to the effect that a further rise in Steel Billets is imminent, and that, therefore, Wire Rods must then develop a rising tendency.

**Merchant Steel.**—The market continues very unsettled, with low prices cropping up from time to time. Tire Steel has been sold in Boston lately in moderate quantities at 2.15¢.

**Old Rails.** Aside from a few small lots no transactions are reported. The supply here is still very restricted. It is stated, however, that two lots of 2500 tons each from local roads are available to Eastern Pennsylvania mills, and that bids have been asked on a lot of about 4000 tons in the South. We continue to quote, nominally, \$28.

**Track Fastenings.**—We quote, delivered, Spikes \$2, and Angles \$1.75 @ \$1.80.

F. G. Gorham, recently appointed Eastern sales agent of the Allegheny Bessemer Steel Company, the new Steel Rail mill near Pittsburgh, has established temporary headquarters at 3 Cliff street. He will remove to the Mills Building on May 1.

## Financial.

Trade conditions are generally regarded as more favorable than a week ago, for several reasons. There is no longer any apprehension concerning the April settlements or the course of the money market in the immediate future. Contrary to expectations gold shipments have not been renewed. Foreign purchases of American securities, together with increased exports of corn, cotton and other domestic products, affect favorably the course of exchange, while imports have at least temporarily fallen off. Railroad earnings are larger, because of the early opening of navigation. The lake and rail lines have begun quoting through rates for the summer season of 1889, which are about 5 ¢ @ 100 lb lower than existing through rates by rail. Respecting the condition of affairs in the West the *Inter-Ocean* says: "The country tributary to Chicago is in apparently more prosperous condition than a year ago, and the agricultural season is probably about three weeks in advance of the average spring. These things stimulate the borrowing of merchants, manufacturers and agriculturists everywhere, and there are more of them who depend upon Chicago capital each year." In Boston apprehensions are expressed on account of the extended loans of the banks, and the liability to further expansion, while assets of all descriptions have shrunk a good deal. More failures, it is intimated, are not impossible. The settlement of the weavers' strike in Fall River has removed what might have become a disturbing element. The prices of several leading staples have a downward tendency. Wheat is 3½ cents lower. The flour market on spring stock is gone to pieces on the breaking up of the combination of millers in spring wheat sections. Spot cotton is firm and in good demand. Among grocery jobbers there is a cheerful tone, and the business of the month compares well with last year. Coffee broke on news of a heavy decline in Havre, attributed to fears of the financial situation in Europe. In sugar there is a decided gain. Japan teas are advanced. Dry goods jobbers are less active.

The Stock Exchange markets were irregular, and all the leading granger and

Southwestern stocks showed a decline of 4 @ 10 % during the month, mainly due to the pressure to sell rather than to manipulation. Atchison dropped to 89½, as compared with 50 about a fortnight ago, and still enters largely into current transactions. There was also a steady outpour of Reading. An attack on Lackawanna immediately followed the declaration of its usual dividend, on the assumption that this payment is not warranted by the condition of the coal trade. Rumors of a receivership for Atchison were contradicted. Troubles in the West, however, have a depressing influence on the general markets, the trunk line stocks and coal stocks not excepted. On Monday Atchison absorbed attention, the belief becoming more general that Gould has designs on the property, and prices were lower. On Tuesday the market opened steady to strong. In the afternoon the speculation was less active, but the undertone was firm, and in the last hour the market was very strong, the closing prices being the best of the day.

United States bonds were quoted as follows:

U. S. 4½, 1891, registered.....	108
U. S. 4½, 1891, coupon.....	108
U. S. 4, 1907, registered.....	123½
U. S. 4, 1907, coupon.....	123½
U. S. currency 6s.....	120

The New York Associated Banks report a loss in reserve for the week of \$1,248,800, reducing the surplus to \$5,450,125, against \$9,145,575 in 1888 and \$4,379,825 in 1887. The most important change in the items was a decrease in deposits of \$3,566,000. There was a loss in specie of \$1,697,000 and in legal tenders of \$443,300. Loans were contracted \$288,200. The banks, it was estimated, lost over \$3,000,000 through the operations of the Sub-Treasury and the movement of currency to the interior, chiefly to the West. It is remarked, however, that the Western money markets are more quiet than usual at this season. In the absence of gold shipments money in New York has been comparatively easy. Time loans are 4 % for 30, 60 and 90 days, but loans for four, five and six months can be made on first-class collateral at 4½ %. It is expected that after the middle of April the banks will discount more freely. Rates are 4½ @ 5 % for 60 @ 90 days. Altogether the financial situation is better than was expected. The Secretary of the Treasury has not announced a change of policy in regard to the buying of bonds and continues to accept only 4½ % at the current price. April payments in New York and Boston on account of interest and dividends amount to about \$55,000,000. Assistant Secretaries Batchelor and Tichenor assumed office on Monday.

The market for sterling is firm at \$4 89½, actual business. The supply of cotton bills is small. The influence of the export movement may become more noticeable now that the prices of wheat are down near the point where foreigners can buy. The better feeling in England appears from the fact that the bank rate of discount remains at 3 %, although misgivings are felt respecting institutions in France. Silver is lower.

The President nominates James N. Huston, of Indiana, to be Treasurer of the United States, and Ellis H. Roberts, of New York, to be Assistant Treasurer at New York City. Interstate Commerce Commissioner Walker has filed his opinion in the investigation recently held by the commission to determine how far Southern railroads are complying with the fourth section, or long and short haul clause, of the Interstate act. It appears that upon many of the lines tariffs of some of the companies have been brought quite generally into harmony with the rule of the law; some exceptions, however, remain. The order of the commission is that the car-

riers named in the order of notice comply with the statute in the particulars and respects pointed out without unnecessary delay, and make report to the commission of their action in the premises. If action so reported shall seem to fall short of what is required by the law, further action will be taken.

The surplus in the Treasury April 1 is \$54,006,896—an increase of nearly \$6,000,000 since March 1. On April 1, 1888, it was \$104,000,000, or nearly twice what it is at present. The revenues for the month have been unusually large. The public debt statement shows the principal of the interest bearing debt to be \$915,085,532, of which \$155,147,800 is in 4½ % bonds and \$681,139,000 in 4 % bonds. The decrease of debt during the month was \$13,605,655. The decrease since June 30, 1888, has been \$50,900,994. The excess of revenues thus far is about \$46,500,000: during the same period of the last fiscal year it was over \$83,000,000.

The Coffee Exchange decided to purchase for \$230,000 lots on Beaver steet on which to build.

The exports of specie from this port during the week amounted to \$1,015,000, making a total since January 1 of \$11,463,000, against \$7,175,000 for the same time last year. The imports were \$72,000.

The imports of merchandise at this port during the week were valued at \$8,121,000, of which nearly \$2,500,000 represents dry goods. Since January 1 the total is \$130,919,000, as compared with \$124,445,000 for the same time last year.

## Metal Market.

**Copper.**—Matters in the Copper trade here have been kept in abeyance by the negotiations supposed to be going on in Paris between the representatives of our mining companies and the parties who hold the bulk of Copper left by the syndicate. Moderate quantities of Lake can be bought at 16¢; for spot and April 15¢ is offered. Casting brands have sold in small lots at 14¢, although the leading refiners are understood to have an arrangement to sustain the market. In London there has been more doing than heretofore; when we reported last, the price all round was £40, and, after declining to £39. 5/, it advanced to £40. 10/, spot, yesterday, and futures to £40. 5/. Over 1000 tons of Copper were sold in London Monday and Tuesday, taken together. The January export of Pyrites from Spain was 84,059 tons, against 60,395 in 1888 and 55,831 in 1887; of Precipitate, 3032, against 2022 and 3313.

**Tin.**—Since our last report spot Tin has advanced from £93. 12/6 to £94. 15/ yesterday, and futures rose from £94. 10/ to £95. 12/6. The statistics on the 1st inst. were satisfactory, the visible supply in Europe and America being 14,519 tons, as compared with 14,930 on the first day of March. The spot price of Tin in New York is 21½¢ this morning, after sales of 95 tons Spot at 20.95¢ and 21.10¢, 50 tons June and July at 20.90¢, and 10 July at 21¢. **Tin Plates.**—The demand is moderate, but prices are being forced up here by the firmness abroad. Futures are higher by 10¢ @ box over spots. The range for Coke Tins at Liverpool is 13/8 @ 13/6, and the spot quotations in this city have to be raised to the following figures: per box, large lines: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.75; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.30 @ \$4.40, and Wasters \$4.15 @ \$4.20.

**Lead.**—Since our last report some 700 tons Common Domestic were taken by consumers at 3.67½¢, which is the closing quotation on a dull market. At St. Louis the quotation is 3.40¢ @ 3.42½¢. The January Pig Lead export from Spain

was 10,117 tons, against 12,907 tons in 1888 and 11,798 in 1887; 65,000 lb April Lead brought 8.67½¢ on 'Change.

**Spelter.**—The spring demand does not yet show itself, causing the inquiry to continue slack, while the supply is ample. The range for Common Domestic is between 4.65¢ and 4.70¢, and Silesian is nominally quotable 5.50¢ @ 5.62½¢. Spain exported in January 881 tons of Calamine, against 680 last year and 2290 in 1887. As per Henry R. Merton & Co.'s London statement, the world's Spelter production in gross tons has been as follows:

	1888. Tons.	1888. Tons.
Rhenish Prussia and Belgium...	133,245	129,020
Silesia.....	83,375	81,630
England.....	26,638	20,730
France and Spain.....	16,140	15,306
Poland.....	3,785	4,145
Austria.....	3,827	3,780
United States.....	297,005	254,590
	50,000	38,072
Total.....	317,005	292,692
Average price in London.....	£18. 1/8	£14. 5/

**Antimony.**—Has been in moderate, but steady demand at 12¢ @ 12½¢ Hallett's and 13½¢ @ 13½¢ Cookson's.

#### New York Metal Exchange.

The following sales are reported:

<b>THURSDAY, March 28.</b>	
25,000 lb G. M. Copper, July.....	10.05¢
25 tons Tin, June.....	20.90¢
25 tons Tin, July.....	20.90¢
<b>FRIDAY, March 29.</b>	
40 tons Tin, spot.....	20.95¢
16 tons Tin, July.....	21.00¢
16 tons Lead, spot.....	8.67½¢
<b>SATURDAY, March 30.</b>	
10 tons Tin, spot.....	21.00¢
25 tons Tin, spot.....	21.10¢
<b>MONDAY, April 1.</b>	
10 tons Tin, spot.....	21.05¢
<b>TUESDAY, April 2.</b>	
50 tons Lead, June.....	8.72½¢
<b>WEDNESDAY, April 3.</b>	
32 tons Lead, April.....	8.67½¢
10 tons Tin, May.....	21.25¢
10 tons Tin, May.....	21.30¢

The annual election of officers of the Metal Exchange was held on Monday. There were 91 ballots cast, and William H. Davol was elected president by 46, against 40 cast for the previous incumbent, Mr. Talmadge Delafield. The full list of new officers follows:

President, Wm. H. Davol; vice-president, R. M. Thompson; treasurer, Carl Mayer; secretary, Edward J. Shriver. Managers: Eben B. Clarke, B. Hochschild, Geo. E. Moore, E. A. Caswell, Geo. Nissen, J. M. Clark, Talmadge Delafield, W. I. Russell, Spencer Jennings, Edmund Hendricks, A. Bennett, Jos. Byrne, C. P. Cort, M. B. Smith. Arbitration Committee: J. J. Williams, Lucius Hart, Chas. S. Trench, F. Steiner, T. I. Crane. Inspectors of Election: Geo. N. Frecker, J. F. Haas, Wm. Hagan.

#### Coal Market.

No improvement has taken place in the Anthracite trade, which remains very dull, with stocks accumulating at tidewater and interior points. A feeling was entertained that a decision of the questions relating to tolls, which it was hoped would be reached at the adjourned meeting, appointed for this week, would impart more life to the market. Some differences of opinion in reference both to prices and output have been expressed, the Reading seeming to be particularly restive under restraint and anxious to avail themselves of the advantages recently acquired in opening new collieries. It is understood that this company were not represented at the recent meeting of coal managers in this city, and in fact are opposed to a reduction of tolls, on the ground that individual operators, who are cutting the market, would only be aided in making further concessions. Touching this point, the Philadelphia *Ledger* remarks: "The Lehigh

Valley Railroad are reported to be in favor of an immediate reduction of 10 cents per ton, while the Pennsylvania Railroad are said to be on the fence, willing to go with the majority if in their opinion the trade can be benefited by a reduction." The output of Anthracite for the week ending March 30 was 481,472 tons, as against 780,402 for the corresponding week last year, the reduction being nearly 800,000 tons. The total production thus far for the year is 6,887,784, which shows a decrease of nearly 900,000 tons as compared with the same period a year ago.

The Bituminous trade is quiet. It has been reported that a number of New England manufacturers have already contracted for this year's supply, taking about 30,000 tons each. The New York, New Haven and Hartford Railroad Company are in the market for 200,000 tons of Coal, to be delivered at New Haven, Harlem River, Forty-sixth street, Stamford, Saybrook Point and Bridgeport. Proposals are to be in by April 15.

It is said that there are still a number of interests who have not joined the Seaboard Steam Coal Association, including the following Clearfield shippers: Victoria Coal Company, Robert Hare Powel & Co., the Clearfield Consolidated Coal Company and Messrs. Mitchell & Lazar.

It is announced that parties whose interests are identical with those of the Pennsylvania Railroad have purchased 3000 acres of Coal land in the Madison field, near Greensburg, Pa. The plans include the construction of a new branch road to give the property a connection.

#### British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, April 3, 1889.

A prominent feature of the Copper market has been a decline in the price of Bars to £39. 5/, at which 1500 tons changed hands for prompt delivery, besides several lots for forward. Consumers purchased largely. Since these sales were made there has been a steady demand, under which prices advanced to £40. 10/. Some stocks held by French banks were realized upon, the institutions having been instructed to negotiate.

The formation of the proposed new pool is advancing. A scheme has been agreed upon, but the working details are yet to be settled. The syndicate has been formed to remodel the Comptoir on a fresh basis. The liquidators have had an interview at Paris with the American mines' delegates. The results are not made public, but said to be the best anticipated and satisfactory. The former agents of the syndicate have been quiet since the collapse.

The Chili charters for April, per telegraph, amount to 1600 tons.

Block Tin has been virtually neglected up to within a few days. Cash Straits declined to £93. 10/, and forwards dropped proportionately. There has since been a recovery to £94. 15/, which is attributed to the result of the Dutch Banka sales on Friday, when 24,300 slabs realized an average of £95 in Holland.

The demand for Tin Plate has continued brisk, and the higher prices established last week are maintained. At a meeting of the makers held at Swansea it was decided, by a large majority, not to establish a syndicate. The new Givalia works, at Kidwelly, are now in the course of erection.

Outside speculation in Pig-Iron warrants has been small, but the market continues strong, being stimulated by large demand for consumption and export. The tendency of prices is still upward. Good orders are received from Canada and the Continent, but American orders are scarce. Two additional furnaces are starting up on Hematites, the present demand being in excess of the output. Makers' brands of Scotch have advanced 6d @ 1/ during the week; Middlesboro' Pig has been sold at a 2/ advance and Hematites are a full 6d higher.

The market for Manufactured Iron has been very active, and prices are strong, with an advancing tendency. There is only a moderate demand for Steel Slabs and Rods, but a lively trade is doing in other Steel at firm prices.

**Scotch Pig.**—The volume of business has been large and prices are strong at the further advance.

No. 1 Coltness, f.o.b. Glasgow.....	56/6
No. 1 Summerlee, " ".....	55/6
No. 1 Gartsherrie, " ".....	52/6
No. 1 Langloan, " ".....	56/

No. 1 Shotts, " at Leith.....	53/6
No. 1 Glengarnock, " Ardrossan.....	52/
No. 1 Dalmeilington, " ".....	48/
No. 1 Eglinton, " ".....	45/
Steamer freights, Glasgow to New York, 5/;	
Liverpool to New York, 10/.	

**Cleveland Pig.**—There has been a lively trade and the market is strong, with makers asking about 2/ advance. No. 3 Middlesboro', G. M. B., 39/6 @ 40/, prompt.

**Bessemer Pig.**—Large sales continue to be made and prices are again higher and the market strong. West Coast brands, mixed numbers, 49/, f.o.b. shipping point.

**Spiegeleisen.**—A fairly active trade reported at steady prices. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

**Steel Rails.**—The demand keeps lively and the market very firm. Heavy sections quoted at £4. 7/6, and light sections £4. 12/6 @ £4. 17/6, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—For these the demand has fallen off. We quote £3. 19/8 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—Prices are held firmly and the demand is fairly active. Bessemer, 2½ x 2½ inch, £4. 6/8, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—There is a moderate trade only and prices are without change. Bessemer £3. 18/8, f.o.b. at N. W. England shipping point.

**Old Rails.**—No improvement noted in the demand. Tees quoted at £3. 5/ @ £3. 6/6, and Double Heads, £3. 12/6, c.i.f., New York.

**Scrap Iron.**—Demand continues moderate and prices are nominal. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—Sales are moderate and at unchanged prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin Plate.**—Business has been less active this week, but prices are very firmly held. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/3 @ 15/9
IC Bessemer Steel, Coke finish.....	14/3 @ 14/6
IC Siemens.....	14/3 @ 14/6
IC Coke, B. V. grade.....	13/9 @ 14/
Charcoal Terne, Dean grade.....	12/6 @ 13/

**Manufactured Iron.**—There is still a large trade doing, and the market continues strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d.	£ s. d.
Common.....	@ 8 2 6	@ 5 12 6
Staff. Bl'k Sheet, singles.....	7 12 6 @	.....
Welsh Bars (f.o.b. Wales).....	5 2 6 @	5 5 0

**Copper.**—Under the influence of more active demand from consumers, the market is quite firm. The quoted prices at the close were: Bars, £40. 10/ @ £40. 15/ for spot; £40. 5/ @ £40. 10/ for three months' futures. Best Selected, £46. 10/.

**Tin.**—A larger business has been done, and the market is stronger. Straits quoted at £94. 17/6, spot, and £95. 12/6 for three months' futures.

**Lead.**—No improvement in the demand, and no material change in prices. Quoted at £12. 7/6 for Soft Spanish.

**Spelter.**—The demand slow, and business done at 5/ decline. Quoted at £16. 15/ for ordinary Silesian.

### WEST INDIES.

**PORT OF SPAIN, TRINIDAD, March 1, 1889.**—**Asphaltum.**—A moderate export business has transpired during the fortnight at \$14.04 @ ton Boiled and \$6.84 Crude, both free on board, inclusive of export duty. January and February shipments taken together amounted to 9418 tons, against 10,000 same time last year and 2338 in 1887. **Exchange.**—Ninety days' sight on London, \$4.74 @ \$4.80.—*E. P. Masson*

### BRAZIL.

**PARA, March 29, 1889.**—**India Rubber.**—Receipts from the interior at this point since July 1, 1888, by no means exceed those of the corresponding period of the previous crop, which does not prevent prices from ruling at present below New York parity.—*Per cable direct.*

### AUSTRALIA.

**MELBOURNE, Victoria, March 14, 1889.**—**Iron.**—The tendency in our market is downward for some articles; business drags, yet importers do not feel disposed to make concessions. We quote Scotch Pig Clyde No. 1, £4; Galvanized Iron, £17. 12/6, and Fence Wire, £15. **Tin.**—Shipments from Australia and Tasmania since the 1st inst. do not exceed 150 tons.—*Per cable via London.*

### EAST INDIES.

**MANILA, March 4, 1889.**—**Hemp.**—There are buyers at \$16 @ picul, against same time last year \$7.75, equaling @ ton, cost and freight, £53. 11/, against £28. 7/6. Clearances for the United States since January 1 amount to 82,000 bales, against 39,000 in 1888. There remain loading for do 22,000, against 18,000. Cleared for England since January 1, 66,000, against

97,000; loading for do, 1000, against 10,000. Cleared for all other ports, 9000, against 17,000. Receipts at all ports since last cable, 11,000, against 8000; do since January 1, 160,000 bales, against 135,000 in 1888 and 105,000 in 1887. **Freight.**—\$7.50, against \$5. **Exchange.**—6 months' sight, 3/7, against 3/8½.—*Ker & Co., through their agent, Mr. Charles Nordhaus, 89 Water street, per cable direct.*

### SPAIN.

**BILBOA, March 16, 1889.**—**Iron Ore.**—Dealings during the fortnight have been restricted to trifles at 8/ @ 8/3 Campanil and 7/ @ 7/3 Rubios, but this might now probably be shaded. The number of steamers ready to load has diminished very much, hence the fortnight's shipments will be light. Freight meanwhile remain steady. There were shipped since January 1 854,115 tons, against 814,297 same time last year. **Pig Iron.**—Coastwise shipments for the week amounted to 130, those abroad to 521 tons, and there remain loading for Civita Vecchia two steamers.

### GERMANY.

**HAMBURG, March 23, 1889.**—**Iron.**—Activity has been on the increase in the Rhenish-Westphalian Iron market. Pig, in particular, is in great demand and stocks rapidly being reduced, the decrease being 8000 tons in February. Spiegel is as readily taken for home use as it is for export, but no higher, the quotation remaining 63 marks for 10 to 12 %. Forge Pig was at no time as lively as it is at present, and even the Siegen makers get 55 marks for their product, orders being booked there all the way into September. Foundry Pig moves off satisfactorily at the late improvement, the range being 54 to 63; Thomas continues wanted at 47. Bessemer is also in better request at 56, German. and 47/3, English. Luxembourg Pig commands from 36 to 46 marks. Orders for Finished are booked all the way to July 1; they are nearly exclusively domestic. The weather is so mild that Structural Iron is looking up quite early this spring. Boiler Plates were seldom in brisker request, and the demand now extends to Thin Sheets. The only branch still under a cloud, besides Steel Rails, is the Wire branch. Export of Steel Rails from Germany:

	Tons.		Tons.
1876.....	133,000	1883.....	176,178

Total..... 2,334,202

Showing a steady decrease. The Dortmund quotations for Wire Rods are 114 @ 120; Steel Rails, 120 @ 128, and do. for mines, 110 @ 115 marks. **Metals.**—Lead is a little weaker, Copper dull, Spelter sustained.—*Borsenhalle.*

A society in Chili, which has for its object the promotion of all kinds of industry, and is styled the Fomento Fabril, offers a premium of 20,000 francs for the best system of flour-milling machinery. A competitive trial will take place in Santiago, the capital, in November, and as there are in Chili over 800 flour mills, the successful competitor will doubtless have

the opportunity of providing all the mills of the Republic with improved machinery. Those who wish to send their machinery, or models of machinery, to Chili, will be at no expense whatever. Freight duties and passage of the machinist to and from Chili will be paid by the society.

### The Reading Failure.

The Reading Iron Works have made a general assignment to the Reading Trust Company. It was stated by one of the creditors that the assignment would in no way interfere with the plans for reorganization if any should prove acceptable to the creditors. The assignment was made in order to prevent any preferences being secured by particular creditors. The strong feeling among many of the creditors appeared to-day that the liquidation, however much may be sacrificed, is the simplest way out of the difficulty. Frank P. Prichard, appearing for John G. Johnson, who represents the Falcon Iron and Nail Company and the Florence Mining Company, withdrew the application in the United States Circuit Court for a receivership for the Reading Iron Works. Mr. Prichard stated to Judge Butler that, in view of the fact that the Reading Iron Works would make an assignment, this course would be desirable. Several counsel representing some of the interests involved were present, but raised no objection. The court allowed the application to be withdrawn.

The Reading Trust Company met at Reading on Monday, April 1st, and arranged to assume charge of the iron works. One of the directors said, after the meeting, that under no circumstances did he think the trust would continue the business of the iron works. The company might, said the director, work up the stock and material on hand, but eventually the immense establishment would be sold to the highest bidder.

At the annual meeting of the stockholders of the Tennessee Coal, Iron and Railroad Company, 85,000 shares of the 100,000 were represented, 69,000 being voted by William Duncan for the following Board of Directors: John C. Brown, William Duncan, Sparrel Hill, Samuel Cowan, James L. Gaines, Enoch Ensler, Napoleon Hill, H. D. Bond, C. C. Baldwin, J. D. Probst, F. L. Lehman, H. D. Wood and J. C. Haskell. The board elected ex-Gov. John C. Brown president. The treasurer's report showed profits from last year making \$666,902.42, and payment *per contra* \$336,696.98 for interest, and \$40,000 on preferred stock. The capital expenditures during the year had been \$687,428.63, making a total expended on improvements since October, 1886, of \$2,154,234.86. The total assets of the company show a surplus of \$1,251,300.54 over liabilities of every kind, including capital stock, the surplus of convertible assets over the floating debt being \$437,629.81. The estimated amount of fixed charges for the ensuing fiscal year is \$420,050, embracing both interest and sinking fund.

Among recently-authorized corporations in Illinois is the United States Aluminium Company, of East St. Louis, with a capital of \$1,000,000, to manufacture Aluminium and its alloys. The incorporators are Robert M. Foster, John R. Trusdale and George C. Hackstaff.

To date 27 furnaces, representing an annual output of 903,500 tons, have signed contracts with the American Pig Iron Storage Warrant Company. In addition, companies with 25 furnaces, having a producing capacity of 685,000 tons per annum, have agreed to sign.

# Hardware.

Trade continues in fair though not heavy volume, there being more or less complaint, with the hope that in the near future there will be a decided improvement. Prices are without material change and are not characterized by especial strength. There is more or less complaint that collections are sluggish. The following statement in regard to the condition of business and the outlook for the season's trade, which comes to us from a well-known manufacturing concern of this State, expresses views which are entertained by many intelligent observers:

We see no reason why trade should not continue good for the remainder of the season. Our experience is that most buyers of Hardware have been buying from hand to mouth for several months in anticipation of lower prices. Manufacturers also have been carrying comparatively small stocks on account of decline in price of raw material. We should not be surprised to see not only an improvement in trade, but an improvement in prices, for jobbers will now find that it will be impossible for many manufacturers to fill their orders promptly, and this in turn results in jobbers being slow about filling orders from retailers. Goods will be more scarce and probably more valuable.

## Wire Nails.

The transactions in Wire Nails are of moderate extent, many of the large buyers having already placed their orders and the factories being well occupied in filling them. A good business is, however, being done, and prices remain without change.

## Cut Nails.

Pursuant to a call of the special committee the Eastern Cut Nail manufacturers met at Philadelphia yesterday to discuss the plan for pooling on which the committee has been at work for some time and the leading features of which we have alluded to in the past. It is stated that a considerable number of signatures have been secured and that the movement is making favorable progress. The New York market is beginning to feel the approach of spring in the shape of a growing volume of business, though prices continue unsatisfactory at \$1.80 for carload lots of Cut Nails on dock.

## Barb Wire.

There is more activity in Barb Wire than has recently prevailed. The prices of the Eastern manufacturers continue without change, and are well maintained on the basis of 8.5 cents for carload lots of Galvanized Four Point, 8.6 cents for 3-ton lots and 8.8 cents for smaller parcels.

## Miscellaneous Prices.

Slightly reduced prices in Shot are announced in sympathy with the condition of the Lead market. The revised quotations are as follows, subject to a discount of 2 cents per bag, 25 pounds, for cash within five days from receipt of bill:

Drop, per 25-pound bag	\$1.16
Drop, per 5-pound bag	.29
Buck and Chilled, per 25-pound bag	1.41
Buck and Chilled, per 5-pound bag	.34
Dust, per 25-pound bag	1.75
Dust, per 5-pound bag	.40

The market for Strap and T-Hinges continues low and demoralized. Competition between some of the manufacturers is especially active, others pursuing a more conservative course, and refusing to meet extreme prices.

Buffalo Forge Company, Buffalo, N. Y., issue a circular announcing that, to close out their stock of Door Butts and Builders'

Hardware, they are offering these goods at specially low prices. The circular gives prices at which Butts, Drawer Pulls, Sash Pulleys, Sash Lifts and other goods are offered, with information in regard to freight allowances, &c.

## Obituary.

Many will learn with sincere regret of the death of Edward B. Mead, who was long connected with the trade and widely known and highly esteemed. We defer a more extended reference to his life until our next issue.

P. P. Bryant, an old and prominent citizen of Centralia, Ill., and vice-president of the Centralia Iron and Nail Works, died on the 20th ult., after a very short illness.

## Nominal and Real Sizes of Coil Chain.

It is well known in the trade that a custom prevails among manufacturers of Coil and other Chains sold by the pound to furnish chain  $\frac{1}{4}$ ,  $\frac{3}{8}$ , and even, in some cases,  $\frac{1}{2}$  inch heavier than the size under which it is invoiced. This difference between the actual and nominal sizes of the Chain is an example of the apparently general tendency on the part of manufacturers to ignore the virtue of exact terms in designating goods. In the sizes of Chains more or less regularity prevails, some manufacturers making Chain of a given size slightly larger than do others, thus producing uncertainty in regard to the actual size of Chain purchased, unless the buyer is familiar with the custom of the house in this regard by whom it is manufactured. This condition of things adds force to the remark made by a prominent Chain manufacturer in this connection, that the consumer has much to learn in buying Chain. As the Chain is sold by weight, higher prices being commanded by the smaller sizes, it is natural that the manufacturers should desire to have it full size, and in its manufacture it has been for many years a general custom to have the iron of which the Chain is to be made about  $\frac{1}{4}$  inch larger than the designated size of the Chain. This custom probably grew out of allowing for the scale of the iron, the idea being that the manufactured Chain would be about the designated size. Our advice is to the effect that Chain made from such iron is, in matter of fact, slightly larger than its designation, a matter which would cause but little inconvenience or uncertainty if this standard were always adhered to. There is, however, reason to suppose that some manufacturers, under the animated competition which prevails, are making Chain from iron which is more than  $\frac{1}{4}$  inch full,  $\frac{3}{8}$  inch being frequently used, and, in some cases, probably  $\frac{1}{2}$  inch full. Well-known Pennsylvania manufacturers thus refer to the matter, explaining their adherence to the custom above mentioned and alluding to irregularities which are creeping in and the need to have something done to remedy it:

Our rule in the manufacture of Coil Chain is to roll all the iron  $\frac{1}{4}$  inch full for all sizes. That is, for  $\frac{1}{4}$ -inch Chain we would use iron rolled  $\frac{3}{8}$  inch; for 1-inch Chain,  $1\frac{1}{4}$ -inch iron, and so on throughout the list. This  $\frac{1}{4}$  inch is supposed to be about what the iron would lose when heated and worked into Chain. As our own mill rolls the iron we use, we have the grooves so turned that all iron rolled for our Chain works from  $\frac{1}{4}$  inch to  $2\frac{1}{4}$  inches is rolled  $\frac{1}{4}$  full, and we expect by the time it is finished into Chain it will be about

down to correct size, so that the customer gets as near as possible what he orders. We never use exact size iron, for the simple reason that by the time it is made into Chain it would be under size. We believe that the majority of Chain manufacturers follow the same standard rule we do; yet we are sorry to often find certain parties, seemingly anxious to gain a little weight, go so far as to use iron  $\frac{1}{4}$  full, gaining but little for themselves and causing much annoyance among the trade. We believe your taking the matter up will help to remedy matters.

Referring to the irregularities thus found in the actual size of Chain, a well-known jobbing house remarks:

We presume the jobbing trade would be disposed to be somewhat lenient on this custom, realizing the very narrow margins of manufacturers, but the more acute of the retailers and consumers appear to be on the lookout for this species of deception, and in many cases refuse to have goods not running to gauge. The more scrupulous manufacturers and jobbers invariably suffer by small dishonesty of this sort on the part of competitors, but we believe it is only necessary to have the matter fully understood and the distinction properly made among the trade in order to have such abuses abolished. There is no good reason why Chains should be other than marked either as to diameter of iron, number of links to the foot in traces, &c.

As representing the usage of manufacturers of recognized position we give the following statement from a prominent Chain-manufacturing concern in New Jersey, in which they designate the sizes of iron used in making some of the leading smaller sizes of Coil Chain, stating that the larger sizes are made of iron the exact size the Chain is designated:

We make our Coil Chain of the following sizes of iron:

	Diam. in.
8-16-inch Chain, made of No. 4 Iron	0.288
$\frac{1}{4}$ -inch Chain, made of No. 1 Iron	0.300
5-16-inch Chain	11-33
$\frac{3}{8}$ -inch Chain	13-33

Larger sizes we make of iron the exact size that the Chain is designated. We have made no change in this system for many years and have not proposed to do so. We furnish the smaller sizes of Chain of exact size iron when so ordered, charging, of course, a higher price per pound for it.

The following letter from a large Chain manufacturer in Ohio alludes to the prevailing usage and an instance which has recently come to his attention, in which the complete Chain was  $\frac{1}{4}$  inch larger than its nominal size, so that it was in matter of fact 25 per cent. larger than its designation:

It has been the custom of all Chain manufacturers to make their Chain of iron  $\frac{1}{4}$  inch larger than the actual size of the Chain. This custom grew out of allowing for the scale of the iron, and it has always held good. For instance, if a party orders  $\frac{1}{4}$ -inch Chain he gets  $\frac{3}{8}$  inch; ordering  $\frac{1}{2}$  Chain he gets  $\frac{3}{4}$ . However, we are pretty well convinced that some Chain manufacturers, on the smaller sizes more particularly, use some deception.

We now have an instance of the kind before us in this way: A customer of ours in the South had a cask of Chain that he says he bought for  $\frac{1}{4}$  inch, and having no use for it opened a correspondence with the view of getting us to purchase. We took it from him presuming it was our Chain, but on receipt of same found it was made by some other manufacturer, and in place of being  $\frac{1}{4}$  inch was  $\frac{3}{8}$  inch exact. Now, the manufacturer of this Chain quite

probably did that for the purpose of getting the price of  $\frac{1}{8}$  inch for  $\frac{1}{4}$  inch iron, the iron costing him less by reason of its being a larger size than the requisite size for the usual  $\frac{1}{8}$  inch. The custom, however, is exactly as we have stated above,  $\frac{1}{8}$  full, and there are times when the iron may be somewhat in excess of  $\frac{1}{8}$  full, by reason of the rollers at the mill, who, being paid a rate for rolling upon weight turned out, will purposely roll the iron excessively large in order to get greater pay. But that is something that very seldom occurs, although we have known of instances of it.

A prominent Philadelphia house, who manufacture principally heavy Chain and

It is thus obvious that in the present condition of the market purchasers of Chain who are informed in regard to trade usages will expect to receive somewhat larger Chain than they order, and if exact sizes are desired it should be so specified at the time of purchase. They will also be on their guard to see that the excess in the size of Chain is not unduly large, especially as there is at the present time an apparent disposition on the part of some manufacturers to put on the market Chain which is heavier than accords with the established usage of reputable makers. This tendency, which is to be regretted, is one of the evils

board 2 x 8 feet, which is devoted to Eagle Locks. It contains 61 samples, and is attached to the wall. Door Locks, comprising Rim and Mortise, are sampled on 50 boxes; Knobs, 15 boxes; Padlocks, 16 boxes; Butts, 40 boxes, &c. All staple goods are sampled conspicuously, so that the customer is enabled to see at a glance the article he wants without the necessity of taking down boxes, &c. It is found that this method of complete and attractive sampling permits the waiting on customers to much better advantage, and, taking the time saved into consideration, is referred to as worth a clerk's hire annually. Fig. 325 represents a portion of a counter containing a large num-

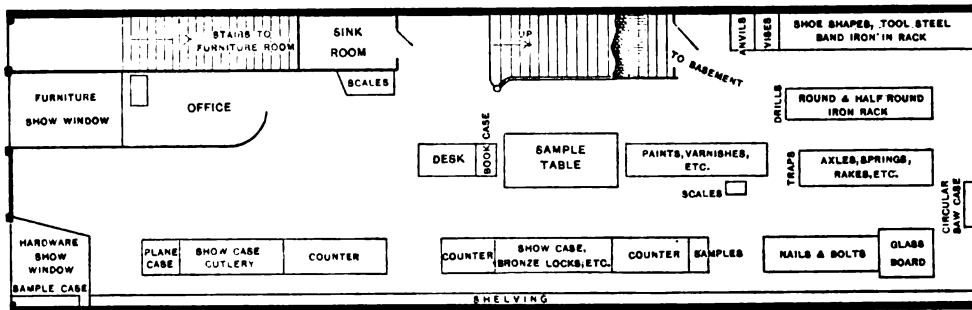

Fig. 323.—Store of L. G. Kingsley, Rutland, Vermont.

of a high quality, refer to the matter in the following terms:

The excess in size only occurs in the cheap grade of Chain. Labor and price of iron increase, as you well know, by each  $\frac{1}{8}$  inch, and much is gained by stretching this as far as the consumer will submit to. In our opinion, the evil will never be corrected in the cheaper grades, for the manufacturer must resort to some device in order to sell at a price lower than good Chain demands. Our practice is to have the iron rolled  $\frac{1}{4}$  inch full, which, after it has been heated and bent, reduces it practically to exact size. Owing to the practice of selling Chain of larger size than represented, we have been virtually driven from the market on ordinary Chain and run our

which results from the active competition which prevails, and which, unless corrected, will result in much annoyance to those who handle and use Chains, as well as to manufacturers who are compelled to meet this kind of competition.

#### Arrangement of Stores.

The illustrations given herewith, Figs. 323 to 327, represent the arrangement of the store of Levi G. Kingsley, Rutland, Vt., showing in detail some of the many convenient and ingenious devices for the accommodation of different goods. Fig. 323 gives the general arrangement of the store, the dimensions of which are 80 x 24 feet. From this diagram the location of

ber of tills or bins. The 15 bins in the three tiers shown in the cut are devoted to Steel Nails, and have a capacity of 150 pounds each. Adjoining them are bins for Horseshoes, two deep, with a capacity of 200 pounds each, and at the end of the counter are Ox Shoe bins, four tiers, with a capacity of 150 pounds each. The portion of the counter devoted to Nails is 8 feet long and 4 feet high, the tills being 20 inches deep, 13 inches high and 14 inches wide. The bottom of the bins is inclined, it will be observed, from the front to the rear. The bins open on one side only. The part of the counter devoted to Horseshoes is 10 feet long, 1 foot 9 inches deep and 1 foot 5 inches high. The bins in the Ox Shoe counter are 18 inches deep, 12 inches high and 9 inches wide. Another

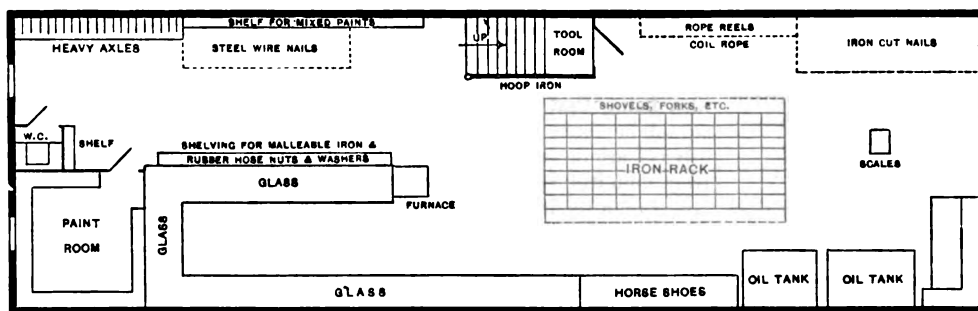

Fig. 324.—Basement of L. G. Kingsley's Store.

works almost exclusively on the higher grades.

A Western manufacturing concern write us that their Chain, from  $\frac{1}{8}$  inch to  $\frac{1}{4}$  inch, is made regularly  $\frac{1}{2}$  inch heavier than the size would indicate, thus conforming to the general usage of the trade, while above  $\frac{1}{4}$  inch their Coil Chain is of exact size. They also state that there appears to be a tendency to increase the difference between the nominal and the real sizes, and refer to their own experience in the matter, as they have recently seen Chain full  $\frac{1}{8}$  inch larger than the size indicated on the barrel, and they state they would not be surprised to see  $\frac{1}{4}$ -inch Chain sold for  $\frac{1}{8}$ -inch in the near future, as this seems to be about the only way to make a profit on Coil Chain at present.

the office, the different counters, racks, &c., will be observed, as well as other details which are of interest, the whole showing the interesting features of this establishment, some of which are not frequently found. The basement, Fig. 324, is devoted, it will be observed, to heavy goods, including Bar Iron, Horseshoes in kegs, Cut and Wire Nails, Paints and Oils, Glass, Shovels, Rope, &c. Some of the fixtures used in this part of the store are referred to and illustrated hereafter. The shelving of the store, Fig. 323, is devoted to Shelf Hardware of all kinds, including a large line of Machinists' and Blacksmiths' Tools and other goods. Green boxes are used to a large extent, the goods being sampled on the front of them. There are 473 such boxes, ranging in size from  $2\frac{1}{2}$  x 6-inch to  $4\frac{1}{2}$  x 8-inch front. Cabinet Locks are sampled on 67 small-sized boxes, there being also a sample-

counter contains a number of bins 10 x 10 x 17 inches, devoted to Strap and T Hinges, light and heavy; others 20 x 17 x 10 inches, devoted to Wrought Hook and Heavy Hinges; and Chain tills, 10 x 14 x 24 inches. These counters are located in the rear of the store, between the Nail counter and the Iron rack, as shown in Fig. 323. The Nail counter has on the outside three rows of drawers for Malleables and Nuts, and on the inside there are openings into the Nail bins, and above them drawers for Bolts and Horse Nails. The bottom of the bin descends from the front to the rear; the drawers and pigeon-holes for Malleables and Nuts run to the middle of the counter, where there is a partition. The outside of counter by this arrangement has 60 drawers and 20 pigeon-holes, and the inside 24 drawers and 23 pigeon-holes. The length of the counter is 21 feet. On the front of the counter

nearest the entrance, Fig. 323, there is a Plane case, which is used for the display of the Bailey Planes, by means of which an efficient exhibition of these goods is secured. The large show-windows on either side of the entrance are worthy of special attention, permitting, as they do, an attractive and effective display of goods. In order to protect the shelf goods from dust at night and during the cleaning of

Fig. 325.—Counter with Bins.

the store, there is at the top of the shelving a curtain, which is let down when desired.

Fig. 326 illustrates the arrangement of Rope reels, which are situated in the basement, as shown in Fig. 323. The method of managing Glass is shown in Fig. 327. In this arrangement common Glass boxes are utilized. They are nailed firmly to the floor and the top box fastened by cleats and supported by braces, one of which is shown in the engraving. This is referred to as an economical and very satisfactory method of arranging Glass. When an invoice is received the Glass is placed in the proper compartment, the boxes and straw being thrown out, all broken Glass being cut into regular sizes. One advantage of this method is that the condition of the stock can readily be seen. It has been in use for a number of years, and is pronounced exceedingly satis-

Fig. 326.—Rope Reels.

factory. The engraving represents a portion of the stock of single-thick Glass, a similar arrangement being used for double thick.

#### The Collins-Coes Wrench Litigation.

June 5, 1875, a bill of complaint was brought by the Collins Company against Loring Coes & Co., manufacturers of the Coes Wrenches, for infringement of a patent granted October 10, 1865, to Lucius Jordan and Leander E. Smith, thus beginning a protracted litigation, which has, however, been terminated by the decision of the Supreme Court of the United States. July 24, 1880, a decision was given by the Circuit Court against Loring Coes & Co., and an injunction issued against the manufacture of the Wrenches in question, and a suit was also brought by the Collins Company against A. G. Coes & Co. In this

case a decision was rendered in favor of the defendants, July, 1884, on the ground that the Jordan and Smith patent was null and void for want of novelty, and the previous decision against Loring Coes & Co. was dissolved and the bill of complaint dismissed. An appeal was then taken by the Collins Company to the Supreme Court of the United States. Their decision, which was rendered by Chief Justice Fuller, March 5, affirms the decision of the Circuit Court in holding that the Jordan and Smith patent, under which the Collins Company brought the suit, was void for want of novelty. The matter having thus been passed upon by the court of last resort is finally disposed of.

#### Items.

Edward S. Hotchkiss, Bridgeport, Conn., for whom John H. Graham & Co., 118 Chambers street, New York, are agents, is calling attention as a seasonable article to the Lemon Squeezer and Meat Press which is illustrated in his advertisement on page 84. We are advised that the demand last season was considerably in excess of the supply, but that a large stock is ready for the business of the pres-

Fig. 327.—Glass Rack.

ent season, and it is intimated that orders will be promptly filled. Some changes have been made in the Squeezer to perfect it, among which may be mentioned the strengthening of the casting.

The Aetna Iron and Steel Company, Bridgeport, Conn., have issued a new price list for 1889. The list is neatly printed and well arranged, and contains much valuable information relating to their line of manufacture of Iron and Steel Bars, Rails, Shapes, Sheets and Plates, and will be found by the buyer a convenient book of reference.

Burditt & Williams, 20 Dock square, Boston, Mass., have recently been appointed sole agents in the United States for the sale of Marty's Patent French Trap, an illustration of which is given in their advertisement on page 90. It is said that in France the sales of this Trap average nearly 1000 per week, and that it is in use in the cities of Paris, Versailles, Lyons, and in the public schools, barracks, hospitals, warehouses, &c., and that it has also been doing efficient work in some cities in this country. The Trap, as will be seen from the illustration, consists of two apartments, in both of which bait is

placed, one-third of the amount being in the outer apartment, which is termed the "introducer," into which the rat first enters, and the balance being in the inner apartment, which is designated the "collector." The circular describing the Trap gives suggestions as to its use, and calls attention to its efficiency.

Sise, Gibson & Co., 100 Chambers street, New York, have recently been appointed agents for the sale of Empire Sheathing, to the quality of which special reference is made. The points made in regard to it are that it is clean to handle, water-proof, obnoxious to mice and vermin of every description, and that it will cover more space for the same money than other water-proof Sheathing. Two kinds are put on the market, No. 60, the regular article, 3 feet wide, which is furnished in rolls containing 900 square feet, and No. 70, which is much heavier and furnished in rolls of 500 square feet. The compactness of these rolls and the fact that they occupy comparatively little space for the number of yards contained in them are points made in regard to the goods.

Hunt & Connell, Hardware merchants, Scranton, Pa., are manufacturing a line of Miners' Lamps, of which they make five different styles, the bodies being the same but with different spouts. The special feature of these Lamps is that the spout and the body are of one piece of metal. The following are their different patterns:

- No. 1, Standard Miners' Lamp, Scranton spout.
- No. 2, Standard Drivers' Lamp, large spout.
- No. 3, Miners' Lamp, small spout.
- No. 4, Miners' Lamp, long spout for kerosene oil.
- No. 5, Miners' Lamp, double spout.

The firm of J. L. Colcord & Son, Peabody, Mass., was dissolved, 28th ult., by mutual consent. The business will be continued by the new firm of Buxton & Co., 77 Washington street, Salem, Mass., J. H. J. Colcord becoming an active partner in the new firm. Their business will be dealing in Seeds and Farm Implements, and they will make a specialty of growing Seed Specialties and jobbing Farm Machinery in their county. It is their intention to add a stock of Hardware in the near future, but for the present they will confine themselves to what may be called Farmers' Hardware.

W. H. Billany and J. A. Cochrane, late with the McFadden Company, Philadelphia, have formed a copartnership under the style of Billany & Cochrane, and have established an office at 704 Arch street, for the sale of Tools, Mill Supplies and Light Machinery. They invite orders for Taps, Drills, Reamers, Chucks, Screw Plates, Pipe Tongs, Wrenches, Vises, Anvils, Forges, &c.

John C. Schmidt & Co., York, Pa., manufacturers of Chain, have appointed Wier & Wilson, Baltimore, Md., their representatives for the Southern trade. They have also increased their storage capacity by the addition of a large warehouse, and advise us that they are now prepared to fill orders promptly.

J. C. McCarty & Co., 97 Chambers street, New York, have been appointed as general selling agents for the Ten Eyck Edge Tool Company, Cattaraugus, N. Y., of whose goods they will carry a stock for immediate delivery here if required. This company have been in operation since 1860, and manufacture a complete line of Axes, Hatchets, &c.

The trade will observe on page 115 the advertisement of the Stanley Rule and Level Company, New Britain, Conn., in which they illustrate the different uses of their Odd-Jobs, thus greatly facilitating the understanding of the many purposes this ingenious tool is fitted to serve.

Wallbridge & Co., Buffalo, N. Y., have issued April 1 an illustrated circular of seasonable goods. It represents Brushes, Picture Hooks, Barb Wire, Post-Hole Diggers, Picks, Wheelbarrows, Shovels, Spades, Steel Goods, Pruners, &c.

Sise, Gibson & Co. announce that after May 1 their New York address will be 118 Chambers street, instead of 100 Chambers, as at present. They have also about completed the removal of their factory to Ansonia, Conn., where they will have much improved facilities.

Among the advertisements on page 108 is one in which F. A. Tyler, Rome, N. Y., illustrates the Eclipse Vine and Plant Sprinkler. This Sprinkler, it is to be noticed, is a combination Sprinkler for water and plaster, and the principle of applying the water is by spraying it on to the hills, instead of pouring, which is referred to as doing the work very effectually. The Sprinkler being in the bottom of the can, the pressure of the water upon the Sprinkler when the valve is opened produces the spray, while there is no waste in passing from hill to hill. The method of applying the plaster is by means of a feed cup placed in the inside of the Sprinkler, with wings which are adjustable for the use of any powdered substance, and can be opened or closed to spread much or little on the hill at a time, thus giving economy in the use of material. One man can use two of these cans at a time, and it is stated that two cans filled will cover 500 hills of potatoes or other plants thoroughly and effectually. The receipt for making a poisonous fluid to be used in the water, making the whole poisonous, is pasted on each can. The economy thus secured is referred to as sufficient to pay the expense of the Sprinkler in one season. We are advised that over 15,000 of them were sold last year, and the Sprinklers are referred to as giving the best satisfaction.

Overman Wheel Company, 182 to 188 Columbus avenue, Boston, Mass., have issued their catalogue for the present year. It is a well-printed pamphlet of nearly 40 pages, illustrating the Cycles made by the company, and going with some interesting detail into the construction of the different parts. A number of Cycle Sundries are also represented, the whole making a pamphlet which will be appreciated by those for whom it is intended.

Northampton Cutlery Company, Northampton, Mass., in their advertisement on page 78 illustrate their new No. 018 beech handle Butcher Knives, for the quality of which they make high claims, and emphasize the fact that they are made of genuine Shear Steel.

C. H. Amidon, Buffalo, N. Y., issues a four-page circular illustrating ten different patterns of Braces, including Amidon's Patent Corner Brace, Second Improved Barber and others. Special attention is called to the Sleeve Braces as having no springs or complications in the jaws or socket, and as being especially durable and satisfactory. The New Eclipse Ratchet Brace and the Globe-Jawed Brace are also alluded to.

From the announcement on page 58 our readers may be advised of the progress which is being made by Des Moines, Iowa, as a manufacturing center, having already, as there stated, over 125 factories, large and small. Information is also given in regard to manufacturing concerns which have recently located there, and the advantages of the city are pointed out.

We are advised that the well-known Cabinet Hardware house of Gibson, Parish & Co., Chicago, Ill., whose establishment on Randolph street was recently destroyed by fire, are making excellent progress in the re-establishment of their business in new quarters, their temporary office being

at 84 Washington street. An impression has to some extent prevailed that they might hereafter limit their business to Cabinet Hardware, but we are authorized to state that this is not the case and that their business will cover the same lines as heretofore, viz: Cabinet and Upholstery Hardware and Upholstery Goods.

The Rake Cap Company, 798 Main street, Bridgeport, Conn., issue a card, intended to be posted in the store, calling prominent attention to their Chamberlain's Rake Cap. It alludes to the fact that it is adjustable to any Rake and saves time and labor in gathering leaves, sticks, grass, &c.

Auburn Tool Company, Auburn, N. Y., in their advertisement on page 63 illustrate the Phelps Combination Plane, an article which they are putting on the market and to the obvious advantages of which they allude.

The Springfield Bicycle Mfg. Company, 178 Columbus avenue, Boston, Mass., issue a pamphlet of nearly 50 pages describing the Springfield Roadster, emphasizing its safety against headers, and illustrating the different patterns and its more important parts. Directions are also given in regard to its use, and a number of testimonials from those who have used the machine.

It will be seen that the Medford Fancy Goods Company, of which I. Bremer is president and treasurer, 44 and 46 Duane street, New York, call attention on several different pages of this issue to their line of Dog and Cat Collars, Furnishings, &c., thus evidencing in another way the enterprise which has resulted in giving this well-known line of goods so prominent a place in the market.

B. S. Hale & Son, Malden, Mass., issue price list showing their line of Electric Wires, Cordage and Cables, Magnet Wires, Silk and Cotton Cover, and also Barb Wire and Braided Wire Picture Cord. The pamphlet, which is No. 33, is neatly printed and conveniently arranged, and contains some valuable tables in regard to the diameter, weight, length and resistance of pure copper wire and the difference between wire gauges.

Frasse & Co., 92 Park row, New York, are issuing a catalogue of nearly 600 pages containing a carefully selected list of Machinery and supplies for metal and wood workers. As usual in works of this character, there are copious illustrations representing a large and varied line of goods, and the arrangement is such as to secure a satisfactory exhibit with due regard to economy of space, thus permitting a very complete line to be shown. As a departure from the usual course in such catalogues it is to be noticed that the arrangement is alphabetical, the volume beginning with Acid Bottles, Anti-Oxidizers, Anvils, Arbors, Augers, &c., and so on through the catalogue, the goods being arranged in the alphabetical order of their names, an arrangement which will be recognized as possessing some advantages. It does not, however, obviate the utility of an index, and one is accordingly given at the close of the book which will facilitate reference to its pages. The volume will be of service to those handling and using the line of Tools shown in it, and reflects credit on the house issuing it, while it also indicates their enterprise and the extent of their business. We are advised that it will be mailed to those desiring it on receipt of \$1.

The Wenstrom Magnetic Separator recently put in at the works of the Lackawanna Coal and Iron Company, at Scranton, Pa., is doing excellent work. Running on bottom droppings from the cupolas the separator treated in 11 days 198 tons of material, yielding 35 tons 3 cwt. of iron,

carrying 90 per cent. of metal, at a cost, including coal, oil and labor, of \$2.50 per day.

## Exports.

BY BARK VORWARTS, MARCH 23, 1889, FOR BRISBANE, QUEENSLAND.

By R. W. Forbes & Son.—23 packages Hardware, 1/2 dozen Meat Choppers, 3 cases Kitchen Utensils, 18 dozen Hoes, 1 dozen Bird Cages, 3 dozen Forks, 1 dozen Dashers, 7 packages Hardware, 6 gross Polish, 4 gross Sewing Machine Oil, 985 pounds Carriage Bolts, 57 dozen Axes, 3 dozen Bench Screws, 17 dozen Spade Handles, 500 Broom Handles, 35 dozen Shovel Handles, 440 pounds Finishing Brads, 20 dozen Axes, 1 dozen Perambulators, 6 racks Churns, 10 dozen Axes, 2 dozen Forks, 1/2 gross Egg Beaters, 10 boxes Clothes Pins, 2 gross Axle Grease, 1 case Corn Mills, 3 dozen Lanterns, 6 packages Hardware, 2 gross Shade Rollers, 2 cases Carriages, 15 boxes Clocks.

By F. B. Wheeler & Co.—1 dozen Step-ladders, 10 cases Hardware, 21 Refrigerators, 7 dozen Axes, 9 gross Shade Rollers, 4 cases Hardware, 1 Refrigerator, 3 cases Plated-Ware, 46 packages Stoves and Parts, 1 case Hardware, 50 dozen Brooms, 50 dozen Brooms, 1 dozen Axes, 5 dozen Axes, 10 dozen Picks, 82 Saws, 10 dozen Axes, 11 cases Hardware, 10 Guns and Parts, 1 case Plated-Ware, 2 cases Hardware, 6 cases Stoves, 1 case Hardware, 1 case Buggies, 1 case Buggies, 6 dozen Saws, 2 dozen Hammers, 25 dozen Brooms, 6 dozen Axes, 24 dozen Handles, 7 dozen Brushes, 36 1-6 dozen Saws, 13 dozen Hammers, 13 dozen Axes, 144 dozen Handles, 10 gross Shade Rollers, 3 cases Plated-Ware, 10 cases Hardware, 21 cases Stoves, 7 1/2 dozen Saws, 15 dozen Hammers, 6 cases Hardware, 2 dozen Axes, 7 1-6 dozen Pumps, 8 dozen Picks, 72 pounds Nails, 2 cases Hardware, 12 sets Wheels, 60 pairs Roller Skates, 325 pounds Castings, 4 cases Hardware, 3 cases Windmills, 6 sets Wheels, 25 dozen Brooms, 12 dozen Hardware, 60 dozen Hardware.

By V. Basanta.—130,000 Ammunition, 30 dozen Hardware, 3 dozen Choppers, 36 dozen Stoves, 15 dozen Rifles, 2 gross Whips, 5 dozen Washboards, 1000 Handles, 3 dozen Wrenches, 18 dozen Hammers, 2 dozen Pumps, 3 gross Axle Grease, 16 Perambulators, 30 dozen Handles, 5 dozen Clocks, 112 dozen Burners, 4 dozen Lamp Goods, 24 dozen Cow Bells, 16 dozen Locks and Bars, 30 dozen Locks and Catches, 4 dozen Braces, 6 dozen Lemon Squeezers, 4 dozen Grindstone Fittings, 2 dozen Saw Sets, 1 dozen Scales, 2 gross Awl Hafts, 24 gross Tacks, 88 dozen Lamp Goods.

By R. W. Cameron & Co.—1/2 dozen Saws, 12 Ranges, 8 Corn Mills, 10 cases Shellers, 1 bundle Hoppers, 900 Spokes, 8 sets Rims, 6 pairs Shafts, 30 dozen Handles, 2050 pounds Castings.

By Winchester Repeating Arms Company.—10 Guns, 12 sets tools, 6000 Cartridges, 10,000 Paper Shells, 3000 Loaded Shells, 30 Guns, 24 sets Tools, 10,000 Cartridges, 120,000 Primers, 9000 Shells.

By A. Field & Co.—9 dozen Hammers, 1 dozen Freezers, 2 dozen Wrenches, 2 1/2 dozen Ladders, 6 dozen Squeezers, 64 pounds Stone, 3 dozen Lifters, 26 dozen Saws, 6 dozen Egg Beaters.

By Coombs, Crosby & Eddy.—28 Stoves and Parts, 18 Meat Choppers, 30 dozen Fruit Jars, 2 dozen Rolling Pins, 1 dozen Wire Traps, 1 dozen Meat Cutters, 10 dozen Tools, 26 Stoves, 1 gross Hardware.

By Reed & Barton—4 cases Plated Ware.

By Arkell & Douglas—22,400 pounds Barb Wire, 10 gross Blacking.

By Strong & Trowbridge—2 cases Rims and Hubs, 9 bundles Shafts, &c.; 1 case Axles, 1 case Axles, 1 case Hubs and Fellos, 9 bundles Rims.

By Collins & Co.—108 dozen Tools.

By New Haven Clock Company—6 cases Clocks.

By A. S. Lascelles & Co.—16 dozen Hammers, 6 dozen Axes, 48 dozen Hatchets, 1 case Lamp-ware, 1 dozen Saws.

By Seth Thomas Clock Company—5 dozen Clocks.

By Ansonia Clock Company—38 boxes Clocks.

By H. W. Peabody & Co.—416 dozen Handles, 36 cases Windmills, 8 bundles Carriage-Ware, 3 packages Traps, 2 cases Plated-Ware, 1 case Carriage-Ware, 24 cases Hardware, 4 cases Firearms, 9 cases Agricultural Implements, 112 pounds Stone, 4 packages Hardware, 2 cases Axles, 2 cases Bolts and Nuts, 1 case Agricultural Implements, 2 packages Carriage-Ware, 7 cases Hardware, 1 case Nails, 2 cases Hardware, 1 case Garden Tools, 1 case Agricultural Implements, 92 packages Hardware, 5 cases Injectors, 9 cases Drills, &c.; 2500 feet Hose, 5 cases Emery-Wheels, 5 cases Die Stocks, 53 packages Hardware, 8 packages Agricultural Implements, 5 cases Egg Filters.

### New Milk-Shake and Ice-Shaving Machines.

The Adams & Westlake Company, of Chicago, are bringing out among other seasonable goods a new milk-shake machine, an ice-shaving machine and an ice plane. Below is an illustration of the milk-shake machine, which was patented November, 20, 1888.

This machine has a cast-iron body, which is handsomely japanned, and a malleable iron top, which is finely nickel-plated. It is intended to be screwed to the floor, and is large enough for a man in a standing position to operate conveniently. It agitates the glasses with a vertical motion, secured by a crank and a pitman, the latter being clearly shown in the cut. The tops covering the tumblers are made of corrugated glass, instead of metal, so that the foam can be seen when the machine is in operation in order to stop at the right time, and also to guard against the corrosion, rust or verdigris accompanying the

Fig. 1.—The A. & W. Milk-Shake Machine.

use of metal. The entire top is detachable, making it easy to keep the machine clean. It is operated very rapidly, a cam movement securing and releasing the glasses instantly, and special care has been taken to make it noiseless. Formulas for making drinks are inclosed with each machine.

The ice-shaving machine here shown is also new, a patent having been applied for. It is of a size suitable for counter use, and is made with cast-iron frame and galvanized body, with an outside jacket of

tin, which is artistically decorated. The base of this machine is stationary, and the top revolves by means of the toothed gearing. A knife is set in the base, and is so arranged that the ice in the revolving cylinder constantly comes in contact with it.

Fig. 2.—Ice-Shaving Machine.

An upright partition extends half way across the interior of the cylinder, to keep the ice in position to be cut, and a suitable weight is also inserted on top of the ice to keep it down. When cut it drops into the drawer below, or the drawer can be removed and glasses used in its stead. The knife can be set to cut either fine or coarse.

A less expensive ice-shaver is shown below, in the form of a hand-plane. It is

Fig. 3.—Ice-Shaver.

made with a cast-iron frame of ornamental appearance, and is mounted on a crystallized wood-lined board, which is a miniature stove-board. It is intended to be fastened on a counter or counter shelf.

The Michigan Sulphite Fiber Works, at Port Huron, have turned out their first completed product, consisting of 22 cords of spruce. The works have four large digesters of 22 cords capacity each and a full complement of other machinery. The buildings are heated by steam and lighted by electricity, and represent an investment of \$200,000. About 50 men are employed night and day. Julius Hess, of Detroit, was the superintending architect. There

are three other institutions of the kind in this country—at Alpena, Waterloo, N. Y., and at Detroit. The fiber is shipped in large rolls to paper mills, where it becomes the principal composition of the better grades of paper.

### Giant Self-Extracting Corkscrew.

The cut herewith given represents this article, which is one of the extended line put on the market by James D. Frary, Meriden, Conn. It is entirely of metal

Giant Self-Extracting Corkscrew.

and finished full nickel-plated or bronzed with nickel-plated screw or trimmings. The screw is described as made of best cast-steel, hardened and tempered. The operation of the spring on shank will be readily understood, and it is claimed that by means of it the hardest cork can be

extracted without pulling. The cut represents the corkscrew half size.

Cheap living enables the Chinese in San Francisco to underbid white labor, but at the cost of a fearful mortality among themselves. Last year the death rate among Chinese, of persons of 20 years of age and over, was 20; among whites, 10.9. Of the total deaths in each class the Chinese show 90.2 per cent. above 20 years, and whites 62; under 20, Chinese 9.8 per cent., whites 3.8. These figures indicate terrible havoc. Cheap food, the custom of herding together, their willingness to live in filth and the prevalence of vice make an abnormal death rate.

**Enterprise '89 Lawn Mower.**

The illustration given below represents a mower put on the market for the coming season by the Enterprise Mfg. Company, Philadelphia, Pa. It will be observed that it is a rear-cut mower, with a guiding roller in the back, with a convenient and simple way of adjusting the same. The rotary-wheel contains five blades, which is referred to as securing evenness of cut, the blades being described as being made of the best hand-saw steel. The bearings are made of brass and are adjustable in case of wear by placing a piece of wire or a nail in the nut and screwing it up. Particular attention is called to the way of adjusting the height of cut. The roller is supported by two iron rods, spotted; thumbscrews enter these spots, and lowering or raising the rods regulates the distance of the

*Enterprise '89 Lawn Mower.*

blades from the ground, so that the grass may be left standing from  $\frac{1}{4}$  to  $1\frac{1}{4}$  inches high. The handle is made of wrought-iron pipe, and is pivoted at a point which is referred to as keeping the machine at its work in all positions of the handle. The dead knife may be adjusted by two set-screws on each side, thus providing for wear of the blades which may occur after long usage. This machine is made in three sizes, with width of cut 11, 13 and 15 inches, weighing respectively 29, 31 and 33 pounds. The diameter of the driving-wheels is 7 inches.

**Humphrey's Pinch Dogs.**

Humphrey Tool Company, Warren, Mass., are putting on the market a line of pinch dogs represented in the accompanying cut. They are intended, as will read-

*Humphrey's Pinch Dogs.*

ily be understood, for use by woodworkers where a joint is to be made that will not admit of using a common wood clamp or hand-screw to draw the parts together, and are put on the market in this way to obviate the necessity of having them made specially at the forge. These pinch dogs have also the advantage of being made uniform, so that in case the user desires to

remove them from the work to allow of sawing, turning or planing, they, or duplicates, may be readily reinserted. They are described as carefully formed of good steel, with spring tempered, which prevents them from bending or in any way losing shape. The corners are slightly

raised, that the blow from the hammer may be put where it will do the most good without danger of bending or breaking the dog. The outsides of the legs are parallel, while the insides are beveled, thus drawing the point and holding it firmly. These goods are referred to as valuable for use at the lathe, as the corrugations bed themselves closely into the wood and prevent

danger of flying out while revolving. The quality of these dogs and their practical usefulness are points which are emphasized by the company.

General Master-Workman Powderly advises short hours as a remedy for the idleness of 1,000,000 men who are willing to work if they could get it to do.

**Standard Rim-Spring Sash-Lock.**

This sash-lock is made by the Yale & Towne Mfg. Company, Stamford, Conn., and 62 Reade street, New York. It is to be observed that it is in fact a *lock* by means of which the window is securely

*Standard Rim-Spring Sash-Lock.*

fastened. It consists of a spring bolt engaging with a keeper placed at any desired point on the window-casing, and has a lock by means of which it can when desired be fastened securely against opening until it has been unlocked. It is obvious that security which does not attend the use of other sash fasts is thus obtained, and its convenience and the excellence of the mechanism are also referred to. The sash-lock is furnished with nickel-plated steel keys as per the illustration.

The Spanish-American Commercial Union, J. M. Ceballos, president, has been organized in this city for the promotion of trade. At a meeting for the election of directors a letter was read from President Harrison expressive of interest in its success, and among the speeches delivered was one by Warner Miller, who dealt principally with the need of the American banking facilities in the countries in question. He declared in conclusion, however, that a rapid and regular mail communication should first receive attention. "My practical experience as a legislator," he continued, "is that the only feasible way of securing this direct communication is to pay liberally for carrying the mails in American steamships. Give us a regular steamship service for one year and we will increase the business with those countries 100 per cent., if not more." Mr. Miller further dwelt upon the importance of sending the American goods in convenient packages. He predicted that if the objects of the association were carried out the United States would have 50 per cent. of the South American trade in less than four years.

### The Aspirating Ventilator.

A ventilator, a chimney cap of improved construction, was patented recently by I. J. Turner, Princeton, N. J., and is now being offered to the trade by Bur-

The Aspirating Ventilator.—Fig. 1—Ordinary Form with Hinged Cap.

ger & Lee, 376 Greenwich street, New York. The device is the result of extended investigation on the part of the inventor, who claims to have designed a ventilator of simple construction and possessing exceptional aspirating power. At the last exhibition of the American Institute it was awarded the medal of excellence. In Fig. 1 is presented a broken view of the usual form of the ventilator provided with a hinged cap or top. This style is especially recommended where soft coal is used, as it permits the chimney to be cleaned out readily, but the common

Fig. 2.—Ventilator as Applied to a Square Chimney.

form of the ventilator is of the same construction except that it has a fixed top. By referring to the engraving it will be noticed that there is an annular flange encircling the smoke-pipe near the top. Surrounding it is a cone-shaped jacket, somewhat larger in diameter than the flange, and which projects a short distance above the top of the pipe. The flat top is supported above the jacket and carries underneath a cover, the sides of which are about on a level with the top of the chimney-

pipe. By means of the intercepting flanges and rings the currents of air are prevented from passing down the chimney, and made to strike in such a direction that a suction is produced and the smoke exhausted. The construction of the ventilator is such that it may be adapted to chimneys of any shape, Fig. 2 showing a square chimney provided with an aspirating ventilator. Fig. 3 is a form of the ventilator especially

Fig. 3.—Ship Ventilator.—Inside Adjustment.

adapted for use on yachts or steamships. By means of the central rod the top can be raised any desired amount, or in case of rough weather closed entirely. The rod is of such length and so arranged that the regulation can be effected from the cabin. Fig. 4 is another form of ship ventilator, the regulating device, as indicated, being on the outside. It is intended for ven-

Fig. 4.—Ship Ventilator.—Outside Adjustment.

tilating engine-rooms, stoke-holes and the lower compartments of a ship. The ventilator shown in Fig. 3 does not prevent down draft under all circumstances, certain parts being omitted for reasons of economy. The other ship ventilator, however, embodies the same principle as in the ones used on house chimneys.

### Superior Thimble, Cap and Collar.

W. W. Gelatt & Son, 239 Ogden avenue, Chicago, Ill., have recently placed upon the market what they are pleased to term the Superior thimble, cap and collar, an illustration of which is presented in the accompanying engraving. The thimble is beaded and crimped and so made as to render it less liable to be pressed out of shape in setting, while causing it to engage more firmly with brickwork. The hooks on the thimble constitute a secure fastening to which the cap,

collar or pipe is attached. This avoids the necessity of driving nails in the walls and ceilings for that purpose. The attachments on the cap and collar engage firmly with the hooks on the thimble, holding

Superior Thimble, Cap and Collar

them securely against the wall and making a very tight joint. The collar is so constructed as to act as a reducer, diminishing the hole to any size desired. The hooks, it is claimed, can be put into thimbles already in the building, making it possible to use the caps and collars manufactured by the company above referred to. The goods are shipped one-third gross to a crate, which occupies a space of 14 x 36 inches and weighs 45 pounds.

### Giant Lightning Ice-Cream Freezer.

This freezer, which is manufactured by the Shepard Hardware Company, Buffalo, N. Y., is represented in the accompanying illustration. The freezer has the well-known dasher which revolves on its journal-bearings when the can turns, forcing the cream from the center to the circumference of the can, and thus securing, it is claimed, quick freezing and

The Giant Lightning Ice-Cream Freezer.

making more ice-cream from a given quantity of cream than other freezers. The Giant Lightning is made at present in 14 and 20 quart sizes, and it is expected that larger sizes will be put on the market next year. It is made extra heavy, the can being made from 4X tin. It will be seen that the freezer has a hinged top, which can be entirely removed if desired.

### The Gem Ice-Shave.

This article is made by the American Machine Company, Philadelphia, Pa., for whom John H. Graham & Co., 113 Chambers street, New York, are agents. As shown in the cut, it is constructed like an ordinary plane made of galvanized cast iron, the interior of which is a receptacle closed by a lid in which the shaved ice collects as the tool is shoved forward and backward over the surface of a block of ice. Being quite short, its extreme length being 6 inches, the point is made that it

*The Gem Ice-Shave.*

can be used conveniently on a block of ice as it lies in the refrigerator. The ice thus planed is referred to as being as fine as snow, and, the lid being raised, it can be emptied conveniently into a glass. By means of a set screw at the back of the plane the knife can be set further in or out, thus regulating the fineness of the ice shaved off. The circular of the company indicates different uses to which the ice thus planed can be put.

### The New Mail Safety.

William Read & Sons, 107 Washington street, Boston, Mass., manufacturers of the New Mail bicycles, which have been so widely sold, have this year brought out a Safety having special features, many of

*The New Mail Safety.*

them the same as those which are found in their regular bicycles. This new machine is represented in the accompanying illustration. The point is made that it is the only Safety having the Trigwell ball head, which is referred to as a great aid in regular steering, as it does not allow sensitiveness, which has been the great fault heretofore of this type of wheel. Its spring fork is a direct vertical spring to obviate vibration and the effects of concussion, and is alluded to as having the advantage of giving no side rocking spring motion, which, the manufacturers claim, makes unsteadiness of riding and steering. It has also the band-brake on the axle of the rear wheel, which is referred to as very simple and effective and not liable to be clogged with mud, as is the

spoon brake. The handle bars are pretty well back to the rider, as shown in the illustration. The machine is described as handsomely built and meeting with a wide sale.

The Pennsylvania Railroad Company, which have been devoting considerable attention to substituting metallic for wooden ties, are likely soon to give a fair test to a new invention. The tie is a steel rectangular shell, with wooden blocks directly under the rails. An aperture large enough to accommodate the rail is cut in

the shell, so that the rail rests directly on the wood. The advantage of this combination of steel and wood is that the rail has the necessary cushion bed, while the wood is protected from the weather. It is impossible for the track to spread, and the wooden blocks, or rail seats, can be changed without disturbing the ballast. It is said that the new tie will cost only about double the price of the ordinary wooden tie and will last fully ten times as long.

The American Marine and Canal Propeller Company, of Philadelphia, have on exhibition at the Stevens House, 27 Broadway, a small model of the Bender propeller, which, it is claimed, will revolutionize the present method of propelling steam vessels. Its distinguishing feature is that the propelling power is in the center

of the vessel and always below the waterline, enabling the boat to ride heavy swells with ease, saving all the power and doing away with the necessity of a marine governor. It also dispenses with the heavy shaft and boxes which accompany the ordinary propeller, affording greater storage room and offering the advantage of concealment of the motive power.

The A. J. Hartford Steel Railway Tie Mfg. Company, of Temple Court, New York City, have closed a contract with the Pennsylvania Steel Company for the manufacture of the Hartford tie. Arrangements will be made also within a few months for the manufacture of this tie in the West. Several orders are booked, and it is expected that they will be filled speedily.

### The Decline of Philadelphia's Export Trade.

As already noticed in these columns, a sub-committee representing the three commercial bodies in Philadelphia have made a thorough inquiry into the causes of the extraordinary decline in the export trade of that port during the last two or three years, and have submitted a preliminary report. The general conclusion reached is that the falling off is due chiefly to discriminating railroad charges on grain, to the advantage of Baltimore. A first important development is that while Philadelphia had in 18 years—1860 to 1877, inclusive—an average of 7.17 per cent. of all the foreign export trade going out from the five principal Northern seaports—Boston, New York, Philadelphia, Baltimore and Norfolk—which had increased to 11.2 per cent. in 1877, it decreased from the last-mentioned year to 6.3 per cent. in 1888—a loss of nearly one-half. Another fact is the significant decrease in the arrivals and (unloaded) departures of transient foreign steamers at and from the port of Philadelphia. Philadelphia's proportion of grain exports to foreign countries in the years 1878, 1879 and 1880 was 16.5, 14.1 and 11.9 per cent. respectively, based upon the total grain exports of seven principal Northern ports. This proportion fell in 1888 to 3.4 per cent. In 1879 Philadelphia exported 31,000,000 bushels of grain, while in 1888 she exported but 1,809,000 bushels. Another significant fact is the decrease of transient foreign steamers touching at Philadelphia, or going away unloaded to get their east-bound cargoes at other ports. Only three years ago 322 such steamers came to the port of Philadelphia; but in 1888 these decreased to 195, and during the last three years more than 60 per cent. of the rapidly diminishing number of such arriving steamers bringing inward cargoes has been compelled to leave in ballast. To fully comprehend the reduction it is needful to observe that during the period covered by the foregoing there has been a marked increase of the import trade, showing inferentially that the interests of Philadelphia are in some way prejudiced by influences that are artificial and abnormal, rather than by a change of natural conditions in the course of trade. Possibly here is a case for the Interstate Commerce Commission.

The vast region in the United States where the rainfall is insufficient for successful agriculture comprises about two-fifths of our entire area (exclusive of Alaska). It aggregates about 1,200,000 square miles, and is about equal to the combined areas of Great Britain and Ireland, Belgium, Denmark, France, Germany, Italy, Sweden, Norway, Holland and Austro-Hungary. This arid region embraces nearly all the public domain and is a third larger than British India, a country having many similar physical characteristics. Arguing in favor of artificial irrigation, Senator Stewart, of Nevada, says: "The most populous nations of ancient times occupied the arid regions of Asia, Africa, and Europe, and subsisted by agriculture prosecuted by irrigation. It is estimated that there are 6,500,000 acres of land now cultivated by irrigation in the United States, varying in value from \$40 to \$1000 per acre, and yielding a net income equal to the interest on a much larger sum than this valuation."

Zacharist Chaffee, president of the Builders' Iron Foundry, in Providence, and trustee of the Sprague estate, died in that city, 30th ult., aged 74 years. He was officially connected with several local institutions. For 20 years he was an active business man in Pittsburgh.

# CURRENT HARDWARE PRICES.

APRIL 3, 1889.

*Notes.*—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# CURRENT METAL PRICES.

APRIL 3, 1889.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

IRON AND STEEL.	
Bar Iron from Store.	
Common Iron:	
1 to 2 in. round and square...	\$ 1.90 @ ..
1 to 6 in. x 1/2 to 1 in. ....	
Refined Iron:	
1 to 2 in. round and square...	\$ 2.00 @ 2.10
1 to 4 in. x 1/2 to 1 in. ....	
4 1/2 to 6 in. x 1/2 to 1 in. ....	\$ 2.20 @ 2.30
1 to 6 in. x 1/2 and 5-16 .....	\$ 2.20 @ 2.30
Rods—1/2 and 11-16 round and sq. ....	\$ 2.10 @ 2.20
Bands—1 to 6 x 8-16 to No. 12. ....	\$ 2.20 @ 2.30
"Burden Best" Iron, base price. ....	\$ 3.00 @ ..
Burden's "H. B. & S." Iron, base price. ....	\$ 2.80 @ ..
"Ulster" .....	\$ 3.10 @ ..
Norway Rods .....	\$ 4.00 @ 5.00

Merchant Steel from Store.	
Per pound.	
Open-Hearth and Bessemer Machinery, Toe Calk, Tire and Sleigh Shoe, base price in small lots .....	2 1/2¢
Best Cast Steel, base price in small lots .....	3 1/2¢
Best Cast Steel Machinery, base price in small lots .....	5¢

Sheet Iron from Store.	
Common American. R. G. Cleaned.	
10 to 16 .....	\$ 2.75 @ 2.80
17 to 20 .....	\$ 2.85 @ 3.00
21 to 24 .....	\$ 3.00 @ 3.10
25 and 30 .....	\$ 3.20 @ 3.30
37 .....	\$ 3.35 @ 3.75
38 .....	\$ 3.50 @ 4.00
B. E. 2d qual.	
Galv'd. 14 to 20 .....	\$ 4.50 @ 4.80
Galv'd. 1 to 24 .....	\$ 4.87 1/2 @ 4.75
Galv'd. 25 to 30 .....	\$ 5.25 @ 5.12
Galv'd. 37 .....	\$ 5.83 1/2 @ 5.48
Galv'd. 38 .....	\$ 6.00 @ 5.85
Patent Planchet .....	\$ 10¢ B. 5¢
Russia .....	\$ 9 1/2¢ @ 10¢
American Cold Rolled B. B. ....	\$ 5¢ @ 7¢

English Steel from Store.	
Per lb.	
Best Cast .....	\$ 15
Extra Cast .....	\$ 16 1/2
Swaged, Cast .....	\$ 16
Best Double Shear .....	\$ 15
Blister, 1st quality .....	\$ 12
German Steel, Best .....	\$ 10
2d quality .....	\$ 9
3d quality .....	\$ 8
Sheet Cast Steel, 1st quality .....	\$ 15
2d quality .....	\$ 14
3d quality .....	\$ 12 1/2

METALS.	
Tin.	
Banca, Pigs .....	\$ 23
Straits, Pigs .....	\$ 23
English, Pigs .....	\$ 23 1/2
Straits in Bars .....	\$ 24

Tin Plates.—Bright.	
Per box.	
Melny Grade.	
IC, 10 x 14 .....	\$ 5.75 @ 6.00
IC, 12 x 12 .....	\$ 6.00 @ 6.25
IC, 14 x 12 .....	\$ 6.25 @ 6.50
IC, 16 x 12 .....	\$ 6.50 @ 6.75
IC, 18 x 12 .....	\$ 6.75 @ 7.00
IC, 20 x 12 .....	\$ 7.00 @ 7.25
IC, 22 x 12 .....	\$ 7.25 @ 7.50

# THE IRON AGE

THURSDAY, APRIL 11, 1889.

## International Congress on Mines and Metallurgy.

Professor Egleston, of the School of Mines, informs us that the French Government has appointed an international congress on the subject of mines and metallurgy, to be held in Paris on September 2 in this year, in connection with the exposi-

ment, and the members becoming so upon the payment of 20 francs.

Letters and communications from this country relating to the subject of mines and metallurgy may be addressed to M. Castel, inspector-general of mines and president of the organizing commission, 144 Boulevard Raspail, Paris.

The committee appointed by the French Government consists of: President, M.

## The Eiffel Tower.

The general characteristics of the famous Eiffel tower at the Paris Exposition, now completed, have become familiar to all through the drawings printed in the illustrated press. The magnitude of the work is hardly appreciated, however. No drawing gives so adequate a conception of the structure as the accompanying

THE EIFFEL TOWER.—PERSPECTIVE VIEW FROM BELOW.

tion. The congress has for its object to make known and discuss the most recent inventions and improvements in mining and metallurgy, and will have brought before it a considerable number of memoirs which have been prepared by engineers specially detailed for the purpose. These reports will be printed and distributed in advance to persons who wish to become members of the congress and will form the basis of the discussion, but other subjects may be introduced or other questions presented by the members, with the approbation of the officers in charge. The congress will consist of members and honorary members, the honorary members being appointed by the French Govern-

ment, and the members becoming so upon the payment of 20 francs. Letters and communications from this country relating to the subject of mines and metallurgy may be addressed to M. Castel, inspector-general of mines and president of the organizing commission, 144 Boulevard Raspail, Paris. The committee appointed by the French Government consists of: President, M. Castel, Inspector-General of Mines, president of the Society of Mineral Industry; vice-presidents: M. Brüll, past president of the Society of Civil Engineers, in Paris; M. Haton de la Goupillière, member of the institute, Inspector-General of Mines, director of the School of Mines, of Paris; M. Jordan, professor of metallurgy at the Central School, past president of the Society of Civil Engineers, of Paris; M. Rémaury, civil engineer of mines. Secretaries: M. Dujardin-Beaumetz, secretary of the Central Committee of Coal Mines; M. Gautier, civil engineer of mines; M. E. Gruner, civil engineer of mines; M. Lodin, engineer of mines, professor of metallurgy at the School of Mines, in Paris.

perspective view, for which we are indebted to the *Génie Civil*, whose editor, Max de Nausonty, eloquently describes the impression it makes. The photograph, which embraces that part of the tower below the first story, was taken at a short distance from the base, showing its four legs, in which the elevators will run.

California has had the best possible weather for growing crops, and the most conservative predict a yield of about 60,000,000 bushels of wheat and 20,000,000 to 25,000,000 bushels of barley. As to fruit, it is agreed that the yield will be enormous.

### Tests of Foundry Mixtures.

It is admitted that foundry practice has made but little important advance in the past generation. Beyond some improvements in molding, a little better knowledge of mixtures of iron and some recent study of the use of ferro-aluminium, ferro-silicon, &c., this whole great industry is practically where it was 25 years ago. There are exceptions to this rule. A few wide-awake, energetic foundrymen, under the stress of keen competition for important work, have experimented successfully with lower grades and reached results both as to economy and quality hitherto deemed impossible. In nine-tenths of all foundries, however, one or other of the two conditions prevails: Either the shop is so full of work and crowded to get out castings on time and in good order that the responsible head cannot find time and thought for careful experiments, or else a state of ancient and rock-rooted prejudice exists that forbids any departure from the good old ways of the fathers. Under either of these conditions the chance for progress is small. It is an unfortunate circumstance also that intelligent, well-equipped foundrymen, with some little acquaintance with books and theory and good practical experience, are scarce, and when found are expensive men. And, parenthetically, it might be remarked that in these days of overcrowded professions and callings the young man who wants to make a sure thing of success in life has only to acquire a fair technical education and supplement it with practical foundry work to open the doors of many profitable places.

Our attention has been called of late to an extended series of experiments in this line made by Rogers, Brown & Co., Cincinnati and Chicago; 119 distinct foundry mixtures are covered by these tests; in all about 800 bars were broken. The standard adopted is an inch square bar, 24 inches between supports and broken by transverse pressure applied in the center. It was noted that nearly all bars overran in size from  $\frac{1}{8}$  to  $\frac{1}{4}$  inch, making the actual breaking strength from 50 to 800 pounds greater than the correct result after being reduced by mathematical formula to inch square. This scarcely noticeable difference in the size of bars makes a far greater disparity in breaking strength than is usually supposed, and accounts for cases of unusual strength reported in foundries where only average results are realized. The bars for these tests were furnished by leading foundries in the West, particularly Ohio, Indiana, Missouri and the Northwest. They represent all classes of work—agricultural machinery, general machinery, architectural work, jobbing, stove plate, hardware, &c. The mixtures used are from coke and charcoal irons, mainly the former. The proportion of foundries using charcoal iron at all is less than 20 per cent. Those using it in any considerable proportion scarcely amount to 8 per cent. These are mainly in the Northwest, where Lake Superior charcoal iron has been a recognized standard for years and is slow to give place to newer mixtures.

One of the most interesting facts brought out is the average strength of about 300 test bars broken. This is 1120 pounds, and it may fairly be assumed that this is the average strength of all foundry mixtures west of the Alleghenies. Exclusive of bars containing flaws, and of which no account was made in the inquiry, 37 broke below 1000 pounds, only 12 broke above 1400 pounds and 3 above 1500 pounds. One bar in which wrought-iron scrap and ferro-aluminium were mixed with pig iron broke at 1958 pounds, the strongest of the series, but it was hard to drill or work.

The two weakest bars were made from a mixture of half each Lake Superior charcoal No. 1 (a favorite brand) and old car-wheels. The strongest bar, other than the one above named, was from an all-coke iron mixture, in which Lake Superior, Southern and Hanging Rock ores were about equally blended. It is clearly proved by the experiments that it is rather by the intelligent mixing of medium-grade irons than by the use of the strongest and highest-priced brands that best results are achieved. In several conspicuous cases, where the highest-priced Lake Superior charcoal irons were mixed with best-known Northern Ohio soft or "Scotch" brands, the object being to "get the best," without reference to price, the results were below the general average, while of the very strongest mixtures a majority were from the cheaper brands. In scarcely a single instance where Hanging Rock, Lake Superior and Alabama or Tennessee coke irons, of proper grades, were mixed in judicious proportions was a weak, hard or defective casting obtained. Some low-grade and low-cost mixtures, thus judiciously made up, yielded strength and general working qualities that were quite surprising. In such adaptations Nos. 2 and 3 grades were freely used without rendering work too hard for machine shop. Wrongly adapted, the same grades would doubtless yield hard and brittle castings.

The bending capacity or deflection of bars was in each case noted. The maximum test was  $\frac{1}{16}$  inch, the breaking strength 1435 pounds. The minimum test was  $\frac{1}{4}$  inch, the breaking strength being 845 pounds. In color and grain results were conflicting. The darkest fractures and those of the cleanest, sharpest grain were sometimes among the weakest, but as a rule were of good strength and soft. A mixture with too much silicon invariably proved weak and brittle, while too little silicon produced physical results very similar. An interchange of views and information was had among the foundrymen taking part in these tests as to facts of foundry practice, methods of charging cupolas, pressure of blast at tuyeres, kind and proportions of fuel used, &c., and it is promised that a summary of the results of these will be given at a later time.

A *bon mot* by one of the veterans in the Eastern cut-nail trade is being widely quoted. At one of the recent meetings of the manufacturers the delicate question of distributing allotment was being discussed. One of the younger manufacturers, who is described as a progressive and energetic though somewhat impetuous man, in pressing his claims for a larger percentage dwelt upon his ability to produce cheaply. After imparting to his colleagues that he was using skelp scrap, costing 1 cent a pound, as a raw material, he was about to leave the conference when the chairman quietly suggested that in his long experience as a nail-maker this was the first case in which he had known a skelp mill to be run to furnish raw material for cut-nail manufacture. The skelp-scrap-nail maker stopped to explain and the impending rupture was averted.

Ryan & McDonald, of Waterloo, N. Y., manufacturers of contractors' supplies, including hoisting and mining engines, derrick fittings, winches, drums, dump and flat cars for construction of railroads, brickyard and stone quarry use, are shipping large orders for their goods. Last week they sent a double-cylinder double-drum hoisting engine to Wilkesbarre, Pa.; 30 dump cars to Brooklyn, N. Y.; 12 rotary dump cars into New Jersey, 50 into Pennsylvania, several smaller orders to brickmakers, and will add several thou-

sand dollars' worth of new and special machinery to their already large plant. They propose to double their capacity during 1889.

### The Armored Coast-Defense Vessel.

Great interest was felt at the Navy Department on Monday in the opening of the bids for the armored coast-defense vessel. It was concluded generally that the figures proposed (the lowest being \$1,614,000) constituted a fair price for the work, and the closeness of the bidding was remarkable. The appropriation act under which the vessel is proposed to be built imposed a severe limitation. It limited to \$2,000,000 the cost (exclusive of armor and guns) of floating rams or other naval defensive structures. This implied that the \$2,000,000 was to provide for the construction of more than one such defensive structure. A torpedo-boat had been contracted for at a cost of \$87,000, and this left a little over \$1,900,000 available, out of which, besides the vessel and machinery, anchors, boats, &c., were to be supplied. So there is much gratification felt at the fact that the proposals received were within the available appropriation. There are many features of interest about the new craft. One connected with the boilers has apparently given much trouble to the bidders and may influence the award of the contract. The specifications provide for two ordinary return tubular marine boilers of 1500 horse-power, but the remainder of the 5400 horse-power required is to be supplied by coil boilers. These have been tried with great success on yachts, and in a modified form by the French Government, but their use in naval vessels will be largely experimental. If they come up to expectations they will result in a large saving of space and weight. But at least one bidder—Cramp—does not feel confident of the result, for he proposed to enlarge the two tubular boilers, and in consideration of this departure from the designs to waive all claim to any bonus for horse-power in excess of 5400. The next lowest bidder—the Union Iron Works—agreed to accept the Department's plan and guarantee results.

The new vessel will be a departure in design from any vessel in the navy, and Captain Hichborn, who is acting as Chief of the Bureau of Construction, is confident that she will be the most formidable vessel for her displacement of any in the world, and able to cope with anything afloat. She approximates the monitor type, and is of 5000 tons displacement in cruising trim. When she goes into action, by taking on water ballast she sinks until her deck is but 16 inches above the water level, thus diminishing the size of the target exposed to an opponent. The sides covering the machinery are to be covered with 16 inches of armor, besides the protection afforded by the coal bunkers. The barbettes containing the guns are to be of 16-inch steel, and the deck will be of steel 2 inches thick. She will be 261 feet long, 49 feet beam, 14½ feet draft, and have a speed of 16 knots. At this speed she can steam 632 miles, but at ordinary cruising speed (about 9 knots) she would travel 2727 miles without renewing her coal supply. But the most remarkable feature will be the tremendous power of her armament. In the forward barrette mounted on a turntable and manipulated by hydraulic power she will carry a 16-inch rifle weighing 110 tons and 49 feet long, one of the largest guns afloat. In the rear barrette there will be a 12-inch rifle weighing 46½ tons. A 15-inch dynamite gun 50 feet long will project from the bow, and in other places the vessel will carry six 33-pounders, three 9-pounders, two 6-pounders and four 3-pounders, all revolving cannons and rapid-fire

guns. Machine guns and electric search lights on a hollow steel military mast will complete the ship, which will take three and a half years to build.

#### Lubricating Loose Pulleys.

This method of lubricating loose pulleys is the invention of John L. Bogert, of Flushing, N. Y. It consists of an oil-hole running diagonally across the shaft and which admits the lubricant to an annular

every afternoon. That part of the shop wall directly behind it had been changed from white to dark brown by the flying oil. The above-described method of lubrication was tried, the hub of the loose pulley being bored out with an annular groove that would hold about 2 teaspoonfuls of oil. After this it ran perfectly for three weeks without being touched, and then seized. An examination showed that there was plenty of oil and that the groove was full of grit, no cover or dust-guard having been used. The pulley ran without caus-

grip of the jaws, but the clamp-jaws prevent any loosening movement of wheel away from the face of the chuck. These chucks are universal and operated by means of screws, pinion and rack; they are, of course, self-controlling, and are attached to the lathe or boring-mill generally by means of a face-plate turned off to fit the seat for that purpose in back of chucks, which if properly done will insure the true running of the chuck and its holding a wheel or tire practically true while being bored or turned. By the use of these chucks

BOGERT'S METHOD OF LUBRICATING LOOSE PULLEYS.

groove formed in the inside of the hub of the pulley. A removable plug or cap covers the outer opening of the oil-hole and prevents the entrance of dust. When the pulley is revolving the groove can be filled with oil by removing the cap, the shaft being stationary. As there is a current of air through the hole when the pulley is revolving, it is necessary to cover the external opening in order that the bearing may not be covered with grit drawn in from the atmosphere. When both shaft

ing any trouble after a cover had been applied to the oil-hole opening; it has run ever since and is never oiled more frequently than every other week.

#### Car-Wheel Chuck.

The accompanying cut represents a 42-inch car-wheel chuck made by the E. Horton & Son Company, of Windsor Locks, Conn. The main difference between this and the regular car-wheel

much time is saved in adjusting work and accuracy is insured. The faces of the permanent jaws are true with the face of chuck, and the bite is made at an angle of 8° unless otherwise ordered, so as to correspond with the shape of flange and tread of wheel. The chuck will take in work from 42½ inches in diameter down to 6 inches. When made with jaws with steps, or common jaws for general lathe work, it is claimed to make the strongest and largest universal chuck in existence.

42-INCH CAR-WHEEL CHUCK.

and pulley are revolving, the escape of the oil through the hole is prevented by centrifugal force; when both are stationary the oil settles in the annular chamber. The shaft is not materially weakened, since, the hole being diagonal, only a small part of metal is removed from the section. The use of this method by Mr. Bogert in his own factory is thus described: The countershaft of a small lathe used by his pattern-makers for wood turning runs 750 revolutions per minute. As originally made it had the customary oil-hole through the hub of the loose pulley. This gave trouble and required frequent rebushing. It was oiled every morning and

chuck made by the same company is the increased strength, the manner of inserting the jaws into the body and the provision of so-called clamp-jaws. The latter (not shown in the engraving) are intended to hold the wheel or tire more firmly in the grip of the permanent jaws. The clamp-jaws are L-shaped and are dovetailed so as to slide on the outer surface of the permanent jaws, the short leg of the L extending over the wheel held. These jaws are moved by screws entering threaded holes in the end of the permanent jaws. The bites of the latter are made to fit the tread of the wheel, which has a tendency to become loosened and pull out of the

**Machinery for the Texas.**—The plans and specifications for the machinery of the armored battleship Texas were received by the Quintard Iron Works on Monday. The Texas is building at the Norfolk Navy Yard, and, like the Maine, her machinery construction is offered to private firms for contract work. The plans have only been sent out from the Department during the last week, and are ready to be sent to any one who may be inclined to bid upon the work. The plans and drawings were opened up in the drafting-rooms of the Quintard Works, and hastily placed in comparison with the drawings of the Maine's machinery. So far as a cursory glance could determine, the most apparent difference between the designs is in the bed-plates, and also in the form of the steel columns. In the Maine these columns are single and apparently simple in form, while in the Texas's designs they are in the form of a Y. This latter form is the same as is seen on the Inman liner City of New York, and is purely an English feature. The boilers for the Texas differ from the design of those for the Maine in being placed fore and aft, having forward and aft firerooms. The shafting for the Texas is shown to be similar to that designed for the Maine. In other respects the machinery for the two vessels appears, on the whole, very similar, and leads one to believe that it will not be a much harder undertaking than the construction of the Maine. The weight of the boilers for the Texas is 53 tons, being much greater and more unwieldy than those of the cruiser. The shell of the Texas boilers is of very great thickness, which accounts somewhat for the weight. The design for the battleship's hull and machinery came from the Barrow Ship-building Company, of England.

### The Forward Gas Engine.

The distinguishing feature of this gas engine, which is manufactured by T. B. Barker & Co., of England, and the United

receives inflammable gas from the fixed gas duct  $j$  in the cover  $b$ , the passage  $j^2$  in the rotating disk  $a$  being brought opposite during the motion of the said disk, and communicating with the duct or curved

in the fixed cover  $b$ , which duct  $f^3$  communicates with the port  $g$  of the small gas chamber  $f g$ .

By the action of the ratchet motion the small gas chamber  $f g$  in the disk  $a$ , hav-

Fig. 1.

States patents of which are in the hands of Philip S. Justice & Co., of Philadelphia, is a rotating valve by which the ignition of the combustible charge in the cylinder is effected. In the valve are eight ignition ports, which come into action successively. Each port having performed its duty makes a complete revolution before it comes into action again, and in the meantime is exposed to the air, by which the greater part of the heat which it has absorbed is carried away. This insures the cool working of the valve, which runs scarcely any risk of cutting, while the constant motion in one direction affords another element of safety. Every time the cylinder takes in a charge the valve gives a partial revolution, but when the gas is cut off completely the valve ceases to move, and the small firing charge, which would otherwise be wasted, is saved. The number of missed explosions is not, however, great in this engine, as the strength of the charge is reduced as the work falls off until it approaches the point at which it would cease to explode; the gas is then cut off entirely, and the valve left stationary until the governor arms again fall. The mechanical devices by means of which these operations are performed are shown by the accompanying cuts, which illustrate a 4 horse-power engine constructed in accordance with the patents of T. B. Barker. The valve  $a$  is mounted on a pivot at the rear of the combustion chamber of the cylinder, and has a number of ratchet teeth,  $e$ , around its circumference. It is rotated by a pawl,  $l$ , worked by a small crank at the end of the side shaft and a connecting link,  $n$ . The cylinder being charged with compressed explosive mixture, the port  $d$  is also charged with the gaseous mixture. The disk  $a$  is by the intermittent motion imparted to it brought into position at the required time for igniting the mixture in the cylinder. The slot or small gas chamber  $f g$  in the disk  $a$ , which is approaching the port  $d$ ,

Fig. 2.

### THE FORWARD GAS ENGINE.

slot  $j$  in the cover  $b$ . The slot or small gas chamber  $f g$  receives atmospheric air to form an inflammable mixture with the gas in the small chamber through the duct  $j^2$

ing been charged in the manner described, is carried rapidly forward, and the gaseous mixture therein is ignited by the fixed relighting gas jet  $h^1$ . The igniting

of the charge in the small gas chamber  $f$   $g$  takes place immediately before the passage  $h$  comes opposite the port  $d$  into the gas cylinder  $a^2$ . The passage  $h$  coming opposite the port  $d$ , the flame in the small gas chamber  $f$   $g$  ignites the gaseous mixture in the port  $d$  and the engine cylinder  $a^2$ . The passage  $h$  opens into the port  $g$  of the small gas chamber  $f$   $g$  imme-

tappet valve, the cam  $p^1$  operates upon the lever  $p$ , causing the stud  $q$  to be disengaged from the slot, and allowing the pawl to fall into the teeth of the valve. When the engine is running so fast that the gas-valve is not opened, the stud holds the pawl out of gear.

This engine has been subjected to a series of tests by Prof. R. H. Smith, of

Fig. 7 a high-pressure card illustrating how the governor supplies a richer charge of gas when any sudden demand is made on the engine. At half-power the brake horse-power was 3.084, equal to a gas consumption of 81.86 feet per horse-power per hour. The lighting jet burned about 2 feet an hour in both cases. When the engine was running empty it burned 53

Fig. 4.

diately after the said small gas chamber and the port  $f^2$  are closed, the duct  $i$  communicating with the port  $d$  a little before the port  $h$  communicates with the port  $d$  to effect the ignition of the gaseous mixture in the gas chamber or cylinder  $a^2$ .

The supply of gas is regulated by the lever  $o$  and the gas-valve  $r$ . The lever re-

Mason College, Birmingham, and has given most satisfactory and economical results. It was tried at full working load, at half load and unloaded, the latter test being divided into three parts—at fast, medium and slow speeds. The full working load trial lasted 85 minutes, the speed being 176.86 revolutions per minute. The

feet of gas per hour at the high speed, 44 feet at the medium speed and 34 feet at the low speed. A comparison of these results with those obtained in the Society of Arts trials in England shows that the

Fig. 5.

#### THE FORWARD GAS ENGINE.

ceives its motion through a spindle,  $o^1$ , from a second lever, which is acted upon by a cam on the side shaft. This cam is under the control of the governor. The lever  $o$  carries a cam,  $p^1$ , which engages with a lever,  $p$ , having at its end a stud,  $q^1$ , taking into a slot,  $q$ , in the pawl  $l$ . Upon the lever  $o$  moving so as to open the gas

indicated horse-power was 5.54, and the brake horse-power 4.807, giving a mechanical efficiency of 0.8677. The gas consumed in driving the engine was 163.2 feet, or 20.79 cubic feet per hour per indicated horse-power and 23.97 feet per brake horse-power. Fig. 6 shows an average indicator card taken during this trial, and

finery. There was a two-story brick and frame structure in which scrap tin was treated chemically to remove the tin from the sheet iron. The loss was put at \$40,000.

### Iron Chimney Stacks.

In many places, notably in ironworks, iron stacks are preferred to brick chimneys. Their efficiency for the same dimensions is somewhat higher, because there is no infiltration of air through the brickwork. The stacks of the Pennsylvania Steel Company, at Sparrow's Point, Md., of which we herewith present a sectional elevation and plan at the base, are lined with brick their whole height, and are bolted down to the base, so as to require no stays, though in this case they would be sufficiently stable from their own weight. A good method of securing such bolts to the stack is practiced by the Pencoyd Iron Works, and is shown in detail in the annexed cuts. Iron stacks require to be

the chimney. The relation is expressed in the equation

$$C \frac{d h^3}{b} = W$$

in which  $d$  = the average breadth of the shaft;  $h$  = height;  $b$  = the breadth of base; all in feet;  $W$  = weight of chimney in pounds, and  $C$  = a co-efficient of wind pressure per square foot of  $a$ . This varies with the cross-section of the chimney and = 56 for a square, 85 for an octagon and 28 for a round chimney. Thus a square chimney of average breadth of 8 feet, 10 feet wide at the base and 100 feet high, would require to weigh  $56 \times 8 \times 100 \times 10 = 448,000$  pounds to withstand any gale likely to be experienced. Brickwork weighs from 100 to 180 pounds per cubic foot, hence such a chimney must

Sizes of Chimneys with Appropriate Horse-Power Boilers.

kept well painted to prevent rust, and generally, where not bolted down, as here shown, they need to be braced by rods or wires to surrounding objects. With four such braces attached to an angle iron ring at two-thirds the height of the stack, and spreading laterally at least an equal distance, each brace should have an area in

average 18 inches thick to be safe. A round stack could weigh half as much or have less base.

#### HORSE-POWER OF CHIMNEYS.

The effective area of a chimney for a given power varies inversely as the square root of its height. The actual area, in practice, should be greater because of retardation of velocity due to friction against the walls. On the basis that this is equal to a layer of air 2 inches thick over the whole interior surface, and that a commercial horse-power requires the consumption on an average of 5 pounds of coal per hour, we have the following formulæ:

$$E = \frac{0.3 H}{\sqrt{h}} = A - 0.6 \sqrt{A}$$

$$H = 3.33 E \sqrt{h}$$

$$S = 12 \sqrt{E + 4}$$

$$D = 13.54 \sqrt{E + 4}$$

$$h = \left( \frac{0.3 H}{E} \right)^2$$

In which  $H$  = horse-power;  $h$  = height of chimney in feet;  $E$  = effective area, and  $A$  = actual area in square feet;  $S$  = side of square chimney;  $D$  = diameter of round chimney in inches. The accompanying table is calculated by means of these formulæ. For the foregoing valuable data we are indebted to *Steam*, issued by the Babcock & Wilcox Company, of this city.

The Sperry Electric Company, 194 to 198 South Clinton street, Chicago, have issued a very neat little pamphlet descriptive of the Sperry automatic safe system for electric arc lighting. In addition to the claim made for safety they call special attention to a number of other technical advantages which they say are realized in the use of this system. A large number of testimonials are printed from persons who have introduced the company's various electrical devices, and have found them to give entire satisfaction.

Holding-Down Bolts and Lugs, Pencoyd Iron Works.

square inches equal to  $\frac{1}{1000}$  the exposed area of the stack (diameter  $\times$  height) in feet.

#### THE STABILITY

or power to withstand the overturning force of the highest winds requires a proportionate relation between the weight, height, breadth of base and exposed area of

Plan.

Stack of Pennsylvania Steel Company.

### The Jones Ingot-Pusher.

One of the minor improvements introduced at the Edgar Thomson Steel Works at Braddock, Pa., during the past year has been the addition to the plant of two ingot-pushers designed by William R. Jones, general manager of the works, and patented by him January 1, 1889. In order to relieve the pit, where usually the work of stripping the molds from the ingots is performed, Captain Jones picks up the mold and ingot bodily and transfers it to a car, which is hauled outside of the mill where the pusher is located. The accompanying section clearly shows the construction. The apparatus consists of a

THE JONES INGOT-PUSHER.

hydraulic cylinder mounted horizontally on a frame, and provided with the usual water-supply pipes. In front of the cylinder is an upright frame connected with the cylinder supporting frame by heavy brace rods. The position of the ingot mold and ingot is shown in the drawing, the pusher piston ejecting the ingot through the opening in the upright frame and over the rollers back of it on the bed of the car placed in a position to receive it. The body of the ingot then rests upon the car and its rear end rests on the rollers of the table back of the upright frame, so that the car cannot be moved to bring it into position to receive another ingot without displacing the ingot unless the table be removed; this is effected by reversing the valve shown below the forward end of the plunger, thus admitting water to the front end of the pusher cylinder, forcing it back. At the same time it allows the water to escape from the cylinder of the table back of the upright frame, and causes the supporting table to drop by gravity out of the way of the ingot.

### The Boiler-Makers' Meeting.

A. T. Doughthett, secretary, has issued the following circular:

At a preliminary meeting of the local contingent of boiler manufacturers, held in Pittsburgh, March 20, 1889, it was decided to invite the manufacturers of Pennsylvania and adjacent States to meet in convention at Hotel Anderson, Pittsburgh, Pa., on Tuesday, April 16, 9 o'clock a.m., and that the sense of the meeting might be made known, the following resolutions were passed merely as a suggestion of the line of thought to be followed by the convention:

*Whereas*, The exigencies of our business, on account of the many combinations in other departments of trade with which we have to deal, have placed us in such a position that it devolves upon us to protect ourselves in a manner best suited to our case; and

*Whereas*, No business calls for greater care, better material in the construction of its commodity and more exact workmanship than ours; and in view of the fact that so many disastrous explosions have occurred in the past where material afterward tested has been shown to be of inferior quality; therefore, that we may better secure safety to the lives and the prop-

erty of every community where boilers are used, be it

*Resolved*, 1. That we establish a minimum price or scale of prices for steam boilers below which no manufacturer shall be permitted to sell.

2. That we will in all cases use the best material, refusing to accept contracts where specifications do not call for material of suitable quality to be used in the construction of steam boilers.

3. That we invite all manufacturers of boilers to join our association, knowing as we do that our object is purely philanthropic, and that while we are benefiting ourselves, we are at the same time bestowing one of the greatest blessings upon the

public at large, who should look with distrust upon any manufacturer who, by reason of personal motives, refuses to take this important step.

### Elastic Rail-Supporter.

In previous issues of *The Iron Age* we have had occasion to mention the enormous inroads made by the wooden tie upon our fast-disappearing forests and to de-

the supporter alone and also showing the rail in place, meets every possible objection to iron or rock sleepers, and in view of its cheapness, simplicity and facility of application, may be applied to every kind of sleeper known. It is stated that it will prevent the cutting of the rail into the wooden tie and will render the track more elastic than wood ties, especially when the ties are of hard wood or embedded in hard ballast. The fastening to the ties is very simple and is made by bolts, spikes, latches or wedges, as may be most suitable to the material and shape of the tie. To obtain noiselessness, still more elasticity, to keep out moisture and to prevent sliding or working between the spring-plate and ties, there can be placed under the plate a piece of asphalt felt or any other comparatively soft material. The elastic tie plate is constructed in such a way, as will appear by the sketch, that it can be replaced without removing the rail by simply loosening the bolts and turning the plate to an angle of 45°, when the clips will clear the rail. These ties are made by the Elastic Tie Plate Company, of New York City.

### The Kelly & Jones Company.

One of the largest and most complete establishments of its kind in the country is that of the Kelly & Jones Company, located at Huff Station, on the southwest branch of the Pennsylvania Railroad, about 33 miles from Pittsburgh. The firm are engaged in the manufacture of specialties for the steam-heating trade, consisting of cast and malleable iron fittings, globe and angle valves, heavy fittings in brass and iron for hydraulic and natural-gas works, mill and mining supplies, machinists' and steam-fitters' tools, besides a variety of smaller castings in use in the dif-

THE ELASTIC RAIL-SUPPORTER.

scribe the attempts made to substitute metal. By means of tables we have compared the cost of both and have presented estimates of total cost for an extended time. It is not necessary, therefore, to now repeat or to present a *résumé* of the advantages and disadvantages of the methods of supporting rails. In any system of securing and supporting the rails it is essential to provide a certain degree of elasticity, which not only affects the durability of the ties, rails and rolling-stock, but largely controls the noise and easy rolling of the train. It is claimed that the elastic rail-supporter, of which we herewith present two engravings, showing

ferent trades. Until the present year the works of this firm were located at Jersey City, N. J., but, desiring to avail themselves of the advantages of natural gas and at the same time secure additional facilities for the manufacture of their goods, the plant was removed to Huff Station, on the outskirts of Greensburg, the citizens of the last-named place having decided to give the firm free ground and a cash bonus of \$50,000 in order to secure the plant. The buildings are brick on stone foundations, and consist of a main building 40 x 228 feet, which is divided into offices, shipping-room and store-rooms. Four large wings extend back

from this building. The outside wing is 690 feet long, 300 feet of which is 60 feet wide; the balance of the wing, 390 feet, is 40 feet wide. This wing is used for the gray-iron foundry and fitting department. The other outside wing is 650 feet long, 200 feet of which is 80 feet wide; the remainder, 450 feet, is 40 feet wide. This wing is devoted to the manufacture of malleable-iron pipe fittings. An inside wing, 440 feet long by 40 wide, is devoted to the brass department. Another inside wing, 200 feet long by 40 feet wide, is called the radiator wing. In this is manufactured steam-heating apparatus, for which this firm have an exceptionally large trade. In addition to these buildings is another in the rear of the main building, two stories in height and fire-proof, 100 feet long by 40 feet wide, used for the making and storage of patterns. These buildings were planned and erected with the idea of reducing to the minimum the cost of manufacturing. Every machine is so placed that it is made to yield the greatest possible results. Many of the machines are ingeniously constructed with reference to labor-saving qualities, quite a number of which were invented by Mr. L. D. Cassell, the general manager of the works. In the foundry a novel system of double track overhead railway for the delivery of the molten iron

### The Silent Grinding Mill.

Fig. 1 of the annexed engravings is a view of one-half of the case and one-half of the ring or wheel within the case; it shows the pockets or scoops for taking up the material and carrying it around and dropping it in front of the wheel, and also shows the ribs upon the inner surfaces of both the ring and case. These ribs, which are designed to crush large pieces of material when inserted at the trunnion and falling within the center of the ring, are shown more fully in Fig. 2, a section of which is broken away to show the pockets discharging the material just in front of the wheel. The case is driven by two friction-wheels having contact with the case at its lowest part. This does away with all noise due to the action of gearing,

being  $3\frac{1}{4}$  inches, thus allowing a down grade of  $\frac{1}{4}$  inch, the water flowing through the larger opening and carrying with it the light matter as fast as ground. When it is desired to retain the material within the mill until sufficiently fine, as in the case of foundry facings, the openings in the trunnions are closed by caps and clamps. The material being put through the openings in the top of the case and the door inserted and held by its clamp, the grinding proceeds until the desired degree of fineness has been reached, when, the door having been removed, a few revolutions will discharge the contents into a box placed underneath the mill. To sift out the material as fast as ground, the door is furnished with a wire cloth through which the ground material passes at each revolution. As the countershaft runs

Fig. 1.

Fig. 2.

### THE SILENT GRINDING MILL, BUILT BY ALBERT M. HILL.

from the cupola to the molders' floor has been introduced and is in successful operation, the empty ladles returning on one side, while the loaded ones pass them coming from the cupola. It is, in short, an endless railway, running parallel. The most perfect devices for the prevention and discovery of fire have been adopted. A watchman is employed who walks through the buildings at stated times. His movements are recorded by a Howard electric watch-clock, which files a record of his movements as he makes his rounds. Automatic water-sprinklers are scattered over the entire building, on all the floors, at a distance of 10 feet from each other, which release a stream of water when the temperature rises to 160° F. When in full operation the works gives employment to about 600 hands, with a pay-roll amounting to over \$5,000 per week. The capital stock of the company is \$300,000, while its officers are as follows: John T. Kelly, of New York, president; James Balph, of Pittsburgh, vice-president; George M. Jones, of Greensburg, treasurer, and Waiter J. Kelly, of Pittsburgh, secretary. The main office is located at the works, while a branch office and warehouse are at 141 and 143 First avenue, Pittsburgh, Pa.

and permits the use of the mill in locations where it could not otherwise be placed. Being driven from below instead of at the center, the power required is small. The heavy ring or wheel, rolling in the case at a speed of about 40 revolutions per minute (when grinding cinders), has great crushing force and grinds rapidly. As the joints are made water-tight by rubber packing, and the hollow trunnions have caps and clamps to hold them when desired, the mill may be used to grind any material, either wet or dry. If it be used for grinding foundry cinders, or skimmings, a branch can be led from the blower-pipe to the opening in the trunnion to blow away the dust as soon as pulverized; this passes out at the other trunnion and can be conducted away through a pipe placed loosely over the outer end of the trunnion. If the dust is objectionable or the works have no blower, the material can be ground wet by leading a pipe to the opening in the trunnion and allowing a stream to flow through, being carried away by a pipe under the outer opening on the opposite side. In this case the openings in the trunnions are of different size, the one in front being  $2\frac{1}{4}$  inches in diameter and the opposite one, out of which the water flows,

continually, the mill is started or stopped by raising or pressing down cam-levers which operate yokes at each side underneath the trunnions, thus lowering or raising the case and bringing it in or out of contact with the sheave. As all the parts of the mill proper are castings requiring no machine work and are interchangeable, any part can be renewed at small cost. This mill is manufactured by Albert M. Hill, of New Haven, Conn.

The steel steamship *Cayuga*, built at the Globe Iron Works, in Cleveland, for the Lehigh Valley Railway Company, was launched on the 2d inst. She cost \$250,000 and measures as follows: Keel, 292 feet 2 inches; over all, 308 feet 8 inches; beam, 40 feet; molded hold, 25 feet 6 inches. Her engine is triple expansion; cylinders, 24, 38 and 61 inches, with a 42-inch stroke. She went into the water with all her machinery aboard of her. Boilers are ready, and she will be ready for sea about the middle of May. The *Cayuga's* carrying capacity is estimated at 2650 net tons on a  $15\frac{1}{4}$ -foot draft, or about 3000 net tons on a  $16\frac{1}{4}$ -foot draft. Her speed is figured at 14 miles per hour.

## MANUFACTURING.

### Iron and Steel.

The employees of the Crane Iron Company, at Catasauqua, Pa., have been notified of a reduction of wages, as follows: Keepers, \$1.90 per day; first helper, \$1.65; second helper, \$1.50; fillers, \$1.50; ironmen, \$1.50; laborers, \$1.10, and all others, 10 per cent.

On Monday, the 1st inst., a notice was posted in the works of the Allentown Rolling Mill Company, at Allentown, Pa., announcing a reduction of wages. The pay of puddlers will be \$3.25 per ton hereafter, a reduction from \$3.60. All other employees, except laborers, will be reduced 10 per cent. The pay of the laborers will remain as at present, \$1 per day.

In answer to a report that the Sheldon Axle Company, of Wilkesbarre, Pa., had decided to increase the size of their plant and take on a number of additional hands, we received the following advices from the company under date of the 6th inst.: "We have not increased our plant or facilities for manufacture in a long time, nor have we increased our output more than the demands usually made upon us at this season of the year require. In our business the time of the greatest demand is during the winter and spring months, and we necessarily are running much heavier during those months than during other parts of the year. Business is fairly good with us; we have faith in a good average year's business."

The Falcon Iron and Nail Company, of Niles, Ohio, started up their nail factory on the 8th inst., for the purpose of working up a small stock of nail plate which they have on hand. When this is done the factory will be closed down again for an indefinite period.

McIlvaue & Sons, of Reading, Pa., have resumed operations in their rolling mill, which has been idle for many weeks.

No. 4 Furnace, of Laughlins & Co., at Pittsburgh, now in course of erection, is rapidly approaching completion, and in all probability will be blown in about the middle of next month. The firm are badly in need of this new furnace. Of their three furnaces only one is in blast. Their No. 1 furnace was torn down about two months ago, while No. 2 was blown out during the latter part of March for relining. No. 3 is the only stack now in blast. This firm are making many extensive improvements, which, when completed, will give them one of the finest furnace plants in the country.

During the month of March there were turned out 2500 tons of steel rails at the Edgar Thomson Steel Works of Carnegie Bros. & Co., Limited, at Braddock, Pa. This is the largest output in any one month in the history of the establishment.

The entire plant of the Bethlehem Iron Company, at Bethlehem, Pa., resumed operations in full on Monday, the 1st inst. The price of puddling was reduced from \$3.80 to \$3.45 per ton.

The Steubenville Iron and Steel Company, of Pittsburgh, capital \$50,000, was chartered on the 3d inst. The stockholders are Joseph R. Jackson and Horace Crosby, of Pittsburgh; James B. Murray, Adolf Crandon and William Iles, of McKeesport, and Henry W. Bishop, of Sewickley.

The Millvale plant of Graff, Bennett & Co., at Pittsburgh, which has been idle since the failure of that firm, about a year ago, was put in operation on Monday, the 8th inst., by a syndicate of creditors represented by James Friend and F. N. Hoffstot. Only a portion of the plant is being operated, but it is the intention of

the syndicate to put the entire plant in operation as soon as possible. The Millvale Iron and Steel Company is the name adopted by the new concern.

A press dispatch from Ashland, Wis., under date of the 5th inst., says: "James E. York, who constructed the blast furnace power in this city, which is the largest of its kind in the world, has made a proposition to the Ashland Business Men's Association for the erection of a structural steel plant to employ 1200 men, and to cost not less than \$1,000,000. Mr. York's terms are that a suitable sum and a bonus of \$100,000 be given to the projectors, who are Eastern capitalists, after a plant such as is proposed shall be in successful operation."

The nail factory of the Bellefonte Iron and Nail Company, at Bellefonte, Pa., was closed down for an indefinite period on the 4th inst., on account of an overstock of nails. The puddling department will continue in operation.

Soho Furnace, of the Moorhead-McCleane Company, at Pittsburgh, produced 5700 tons of Bessemer pig iron last month.

On Monday, the 1st inst., the extensive plant of the Arms Bell Company, Limited, at Youngstown, Ohio, manufacturers of nuts and bolts, was completely destroyed by fire. The loss was \$80,000, partially covered by insurance. The firm write us that they will rebuild the plant as soon as the insurance is adjusted. A small warehouse, an engine-house and carpenter shop belonging to Brown, Bonnell & Co. were also destroyed at the same time, causing a loss of about \$1500, fully covered by insurance.

The nail factory of the Laughlin Nail Company, at Martin's Ferry, Ohio, after an idleness of six weeks, resumed operations in full on Monday, the 1st inst., giving employment to about 500 men.

No. 3 Furnace, of the E. & G. Brooke Iron Company, Limited, at Birdsboro, Pa., will be blown out in a few days for repairs.

The rolling-mill plant of the Stewart Iron Company, Limited, at Sharon, Pa., has been closed down for an indefinite period on account of a lack of orders. The two blast furnaces of the company continue in operation.

Last month the blast furnace of the Bellaire Nail Works, at Bellaire, Ohio, produced 5081 tons of Bessemer pig iron, an average of about 162 tons per day.

The Riverside Iron Works, of Wheeling, W. Va., are in receipt of an order from the Buffalo Gas Light Company, of New York City, for two carloads of steel pipe. This is but a trial lot, and if it proves satisfactory additional shipments will be made.

The Central Iron and Steel Company, of Brazil, Ind., are erecting a small addition to their plant for the manufacture of railroad spikes. It will soon be ready for operation.

On Tuesday, the 2d inst., work was commenced on the new plant of the Union Drawn Steel Company, to be located at Beaver Falls, Pa. The works will be built at the lower end of Seventh avenue, on the site of the old car works. The company have bought the entire square from Sixth to Seventh avenue fronting the cutlery works, and also 30 shares of water power which will furnish them motive power. They will manufacture cold-drawn steel, iron and other metals by patented processes and machinery fully controlled by them. The capital stock is \$100,000, a large portion of it being held by Pittsburgh parties. The building will be 50 x 200 feet, one and a half stories high and iron clad. The following offi-

cers have been elected: President, H. W. Hartman, Beaver Falls; vice-president, F. H. Adriance, Poughkeepsie, N. Y.; secretary and treasurer, William Anderson, Beaver Falls; superintendent, W. A. McCool. The works will be in operation in early June.

The blast furnace of the Belmont Neil Company, at Wheeling, W. Va., produced 3400 tons of Bessemer pig iron during the month of March just closed.

M. V. Smith, metallurgical engineer, of Pittsburgh, has just completed a contract for three of his improved regenerative gas furnaces and four gas producers for the Beaver Falls Mills, of Carnegie, Phipps & Co., Limited, at Beaver Falls, Pa., making six regenerative gas furnaces and seven artificial gas producers in these works.

The Leechburg Foundry and Machine Company, of Pittsburgh, whose works are located at Leechburg, Pa., have received an order from the Troy Steel and Iron Company, of Troy, N. Y., to furnish them with ingot molds for their Bessemer-steel plant. They have also received a large order from the Reading Nut and Bolt Company, of Reading, Pa., for rolls.

At the new rail mill of the Allegheny Bessemer Steel Company, at Duquesne, Pa., there were recently rolled in 12½ minutes, 65 rails, each of which was 30 feet long. This plant is now running double turn in every department.

The Norway Steel and Iron Works, at South Boston, Mass., were purchased by J. B. Kendall on March 25 for about \$125,000. The company who have owned these works were formed many years ago by Sebastian B. and Barthold Schlesinger. The plant has cost the company over \$1,250,000, and consists of a tract of land on Dorchester avenue of about 6 acres, with machinery and mills. The works have been unprofitable for some years. The company will be dissolved on May 1.

The entire plant of the Columbia Iron Company, at Columbia, Pa., was closed down on the 6th inst. for an indefinite period on account of the present depression in the iron market.

### Machinery.

Last week the Union Switch and Signal Company, of Pittsburgh, shipped 72 lever machines to Jersey City, to be used at the terminus of the Jersey Central Railroad.

On Friday, the 5th inst., the machinery warehouse of J. B. Sheriff, Son & Co., on Water street, Pittsburgh, was completely destroyed by fire. The loss has been estimated at \$35,000, fully covered by insurance. The firm have arranged to secure another warehouse, and will continue their business without interruption.

The Union Boiler Company, of Reading, Pa., have been dissolved, and the business will hereafter be conducted in Reading by F. J. Obert, Sr. The business of the company in Lebanon, Pa., will be conducted by Mr. Obert and Jacob H. Grove.

The Standard Oil Company have commenced work on their new boiler works, to be located at Lima, Ohio. It will be utilized in manufacturing new boilers, making plates for iron tanks and repairing old boilers. The company now own 400 or 500 boilers in the field which they acquired in the purchase of leases from the producers. A large cooper shop and paraffine works will also be put up as soon as the other works are completed.

The Rensselaer Mfg. Company, of Troy, N. Y., makers of the well-known straight-way valves, are about occupying their new premises in Cohoes, N. Y. The new works comprise a machine shop, of two stories in height, with a 9-foot basement, and are 175 feet long by 43 feet wide. In

the south end of this shop the business offices of the works are located. The foundry beneath, part of which is a cellar, is 160 x 50 feet wide. Between the foundry and machine shop is a one-story boiler-house 35 x 40 feet and a cupola-house 18 x 20 feet. The tumbling mills are in a building 44 x 12 feet. The machinery will be operated by an 80 horse-power Corliss engine, supplied with steam from a 100 horse-power boiler. The buildings are of brick and stone. The coal and iron will be supplied to the cupola by a steam elevator; another steam elevator is in the machine shop. A side track will be on the west side of the works, the railroad frontage being about 450 feet, while the river frontage is about the same as the works are on Van Shaick's Island. There will be about 200 men employed in the manufacture of straightway valves for water, gas and steam, besides a variety of scales and brass castings. The business of this company has largely increased of late, and they have been obliged to erect these new works or enlarge their old ones. Ransom & Co., 94 and 96 Center street, are the agents of the company in New York City.

Bryam & Co., Detroit, Mich., manufacturers of the Colliau cupola, received in one day's mail of this week orders for five Colliau cupolas from different parts of the country.

The Ball Engine Company, of Erie, Pa., have received from the Edison Electric Illuminating Company, of Brooklyn, an order for twelve 300 horse-power compound engines. With one exception, this is said to be the largest order ever given in this country for compound engines, and it will take about a year to fill it. The output of these shops for February was 18 engines, aggregating 1570 horse-power, divided as follows: Three 150 horse-power; four 100 horse-power; six, 80; three, 60; one of 35 and one of 25. It is expected that this summer will be one of the busiest the concern has ever seen.

The Cady Mfg. Company, of Cleveland, have recently incorporated and elected as officers R. C. Moody, president; Frank P. Cady, vice-president, and Irving A. Brown, secretary and treasurer. They will engage in the manufacture of machinery and will make a specialty of machines for the working of wire into all its forms.

The largest amount of agricultural machinery ever shipped to the Pacific Coast in one lot was shipped by Russell & Co., manufacturers of agricultural machinery, located at Massillon, Ohio, on Monday, the 8th inst. The shipment comprised 46 threshing machines, 24 horse-powers and 32 traction engines, and will require an entire train to transport it. The aggregate value of the shipment is upward of \$80,000, and it is probably the largest single shipment of threshing machines and engines ever made. The freight charges on the shipment will amount to about \$8000. With the exception of one other case, where a train of 17 cars was loaded to one consignee on the Pacific Coast, this, it is believed, is the only attempt to run a solid train of machinery through to that territory.

Under date of the 5th inst., the Lloyd Booth Company, proprietors of the Falcon Foundry and Machine Works, at Youngstown, Ohio, write us as follows: "We shipped last month to the New Albany Forge and Rolling Mill Company, New Albany, Ind., one complete 10-inch guide train, and to the Knoxville Iron Company, of Knoxville, Tenn., one rotary squeezer. We have also just completed for the Minnesota Car Company, Duluth, Minn., one 18-inch bar mill, including the extra rolls for same, one No. 1 lever shear and five cranes, and have now under way for Chicago mills the following: One each

10-inch, 12-inch and 18-inch roll trains including the extra rolls for same; two of our No. 1, two No. 3, one No. 4 and one No. 5 lever shears, all with engines attached, four busheling furnaces, one rotary squeezer, one roll lathe, &c. Local business is about as usual, but inquiries are not as plenty as they should be at this time of year for new work."

#### Hardware.

The large works of the Nimick & Brittan Mfg. Company, of Pittsburgh, which are located at Lockton station, about 6 miles from that city, have been closed down indefinitely on account of a lack of orders. The firm are large manufacturers of builders' hardware.

The extensive axe, shovel and saw factories of Hubbard & Co., in Pittsburgh, were totally burned 7th inst. The two main buildings were each 320 x 60 feet long, and the other two buildings were formed as an L, each being about 250 feet long. Only a small section of the office was left standing. It is stated that the loss on the buildings, machinery and stock will be more than \$250,000, which is nearly covered by insurance. The firm employed 360 men, who will be thrown out of employment for a time, it being the intention of the firm to rebuild immediately. The large plant of the firm at Beaver Falls will also close down, as the stock for the axe factory at that place was furnished from the works in Pittsburgh.

It is reported that a syndicate of capitalists of Pittsburgh and Wheeling are contemplating the erection of a large plant to be located at Greensburg, Pa., for the manufacture of steel wire nails, and that plans for the construction of the plant have been drawn up.

The Anthony Wayne Mfg. Company, Fort Wayne, Ind., write under date of 5th inst. as follows: "Last month has been the greatest ever experienced in our business, we having sold over 2000 machines during the month and had to increase our force of workmen so as to enable us to produce 80 machines per day. Orders keep coming in about the same this month, and we are now adding more machinery, and will be able in a short time to make 100 per day. We are still considerably behind our orders, but with the increased facilities we will soon catch up, and the prospect for a splendid trade on our new No. 3 is very encouraging."

#### Miscellaneous.

Carnegie Bros. & Co., Limited, of Pittsburgh, have purchased an interest in the Wallingford manganese mines, owned by Bradley & Lyons, situated in the town of Wallingford, Vt. The Carnegies are to pay \$10,000, and the former owners reserve a half interest in future profits. The Carnegies will put in \$25,000 worth of new machinery and largely increase the force of workmen now employed.

For some time past the old-established Troy Fire Brick Works, Troy, N. Y., have been busily engaged in making extensive improvements, and have added to what was regarded as a model plant a system of tunnel driers and railroad tracks. The driers, in combination with the old system of drying, which is still in operation, increase the capacity of these works to over 10,000,000 fire brick per year. These works are being run constantly and their product is shipped throughout the United States, Canada and South America.

American tourists who have "done" the Old World to satiety are now going through Mexico in large numbers. The capital has a population of about 500,000, of whom probably not more than 50,000 are whites.

## THE WEEK.

The Harlem River Bridge at 185th street is a costly structure. The original contract was \$2,055,000, but the bills now foot up \$2,648,784.

Duluth will be enlarged during the year 1889 by the construction of buildings which will cost upward of \$2,000,000. Among the number are the Chamber of Commerce, Masonic Temple and Union Railroad Depot. The city will soon have 50,000 inhabitants.

English papers describe several successful trials of smokeless powder. After heavy firing there was only a faint mist. Hereafter battles may be prolonged with unaccustomed fury and pertinacity.

Visitors to the Paris Exposition crowd the steamers sailing for Europe.

The new Secretary of the Navy is said to be a hard worker. He is already familiar with the duties of the office.

The new Collector of the Port of New York is Joel B. Erhardt, recently a candidate for Mayor, and Cornelius Van Cott succeeds Postmaster Pearson.

One hundred refrigerator cars have been built expressly for the Atlantic Coast all-rail route and have made their first trip, arriving from Florida about two days quicker than by the water route, while the freight charges are the same. The ice in the cars is all placed near the top, so that the cold air, on account of its natural tendency to descend, will be about uniform in temperature throughout the entire trip. A special system of ventilation has also been introduced.

The valuable phosphate lands near Charleston, S. C., are being bought up by New York capitalists at from \$200 to \$300 per acre.

An extraordinary case of alleged smuggling and fraud on the Custom House was developed during the week, in which the large Parisian firm of Allard & Son, on Fifth avenue, in this city, are implicated. Blossaire, a former subordinate of the house, voluntarily communicated with one of the United States special agents information which led to the seizure of the Fifth avenue establishment, wherein was found a large quantity of upholstered furniture stuffed with tapestries, silks, laces, bronzes, &c. The scheme pursued by the firm, it is alleged, was to consign to their New York house cabinet furniture in which were concealed, underneath the marble tops and in the false paneling, costly portière curtains and rich Gobelin tapestries. Customs duties, of course, would be paid only on the furniture. In the Fifth avenue store the smuggled goods would be removed. Purchasers were charged extravagant prices for the articles, with the duties added thereto. Thus a double fraud was perpetrated. It is not suspected that any one of the many purchasers had the remotest idea that the goods were smuggled, but it is surmised that they will have the alternative presented of paying the duties or forfeiting the goods.

Fire Marshal Lewis, of Brooklyn, has captured several alleged anarchists, of whom Bernard Naumann is the supposed leader, who are charged with numerous acts of incendiarism, with the object of obtaining the insurance. Thus far they have succeeded in obtaining \$15,000 from the various companies.

Property owners who are interested in real estate in this city lying contiguous to the proposed termini of the North and East River bridges vigorously oppose the bills authorizing their construction. The former, it is claimed, would prove injuri-

ous to navigation, especially if it should have a central pier. Besides, its approaches might extend to Union Square. The East River Bridge would, it is said, convert Fourth avenue into a thoroughfare for railroad traffic. It can hardly be assumed that arguments of this character would apply equally to all kindred enterprises and to all locations.

San Domingo, which lately favored the Northern party in the Haytian struggle, has suddenly declared in favor of Legitime, who at once succeeded in borrowing \$600,000 from merchants in Port au Prince on the strength of this recognition. The defection of San Domingo is the hardest blow Hippolyte has received.

William J. Lyons, who died in this city last week, for more than a quarter of a century was a member of the firm of Blunt & Lyons, who were among the largest gun-makers and dealers in New York City.

Montreal advices from England respecting the cattle trade indicate a marked depression, the supplies being excessive in all markets and the outlook for Canadian shippers was discouraging.

All the shipbuilders along the Delaware River have had to increase their working force materially within the last half-year, so that now fully twice as many men are employed in the various shipyards as there were a year ago. Not only have Government contracts kept the firms busy, but there have been many orders for merchant ships for private enterprises. The Wilmington yards and the smaller companies near Philadelphia have had a like extension of business, and have employed a proportionate number of new men.

New Orleans will derive an important advantage from the completion of the work of connecting the Mexican Gulf canal with the Mississippi River by a system of locks, affording a new interior route. With a safe water route established between New Orleans and the Alabama coal fields, for barge navigation, Southern coal should be delivered in New Orleans in bulk at rates of transportation as cheap as those of the water-route between that port and the coal mines of Pennsylvania.

Better prices for sugar have given a new impulse to the sugar industry in Louisiana, and planters are ordering improved machinery, otherwise known as diffusion apparatus. New Orleans foundries claim that they can construct all the machinery needed in the sugar region, whether diffusion batteries, double mills, double effects or vacuum pans.

The People's Line steamer Dean Richmond has been equipped with new steel boilers and the Day Line steamer Albany has a surface condenser.

St. Paul papers describe the plans of a new opera-house to be built in that city at a cost of \$1,000,000.

The railway system in the British island of Jamaica has been sold to an American syndicate. The line comprises about 93 miles, running from Kingston to Spanish Town and Old Harbor, and another line from Kingston to Porous. The syndicate have also acquired the right of building what is practically a belt line around the island, and will export largely of native products.

The new Inman ship the City of Paris promises to be the greyhound of the Atlantic fleet this summer. The official report of her trial trip says that she made 20 knots an hour.

The new courthouse just completed at St. Paul, Minn., takes rank among the most imposing architectural piles in the West. The several contracts for construction amounted to \$877,000. The walls are

of stone, and the iron roofing was put on by the Hugh Ketchum Iron Works, of Indianapolis, for \$79,724.06. The plumbing contract, amounting to \$9600, was secured by J. P. Dawson, of St. Paul.

The proposed stairways, porticoes, towers and approaches to the new Capitol building at Albany will cost \$2,700,000 if completed in accordance with the plans now exhibited.

The Philadelphia and Reading Railroad have decided, it is reported, to sell several million dollars' worth of their property, in order to pay off some of their mortgages, and so reduce fixed charges. Among the properties to be disposed of are their rolling mill, including 43 dwellings and 51 acres at Reading, the rolling mill at Hamburg, the Mansion House at Mount Carbon and a large amount of improved farm lands.

The South Boston Iron Works are pushing the work on the 6-inch rifles for the Government. The first gun will be ready for shipment to the proving ground by the middle of next month, and from that date on one gun will be completed each succeeding month. The forgings and material for the guns are being made by the Midvale Steel Company, the work having been given them direct from the Navy Department. These works and the West Point Foundry each have contracts for six guns. The South Boston Iron Works have now at Sandy Hook two 12-inch breech-loading guns for trial. If the next 12-inch gun proves successful the company expect a contract of from 50 to 100 guns of the same type.

Three prominent Knights of Labor in this city are in difficulty, having been indicted by the grand jury under a charge of attempting to dynamite Stevenson's brewery about two months ago. They are John O'Connell, Thomas Reardon and Patrick S. Close, members of the Executive Committee of the Ale and Porter Employees' Protective Association. The principal witness is an informer named Henry A. Fitzgerald, who claims to have been until lately a Knight of Labor, and also boasts that, as a walking delegate, it was he who first urged the boycott against Stevenson's brewery.

The American Silk Manufacturers' Association propose to establish a weaving school, and a committee has been appointed to mature a plan. The manufacturers state that all the weavers employed in this country are foreigners, and that although the young men who learn the trade here are among the best in the mills, Americans are practically shut out from the industry. Young men here can earn from \$1200 to \$1500 a year.

Major Joseph J. McDowell, a prominent iron broker of St. Louis, died suddenly 6th inst., soon after leaving 'Change. On coming to St. Louis after the close of the war he entered the iron business with the firm of Garrett, McDowell & Co. Later the firm dissolved, and has since been J. J. McDowell & Co.

Secretary Tracy's inspection of League Island last week revealed little besides an array of dilapidated buildings ill-suited to the equipment of a modern navy yard. The iron-plating shop, which is a brick building and in good condition, it is proposed to turn into an iron foundry, which can be done at comparatively small cost. The old steam engineering building, which under the new conditions would be too small for the purpose, it is proposed to use as a storehouse. The present yards and docks building, which is also brick and in fairly good condition, will be retained. The most important new buildings proposed are those of the Steam Engineering and the Navigation, Ordnance and Equip-

ment bureaus. The cost of erecting the two latter buildings and making the proposed changes in the three brick buildings already standing is estimated at \$1,888,000.

The traffic of the Canadian Northwest seems to be gravitating toward Duluth as a direct result of the various extensions of the Northern Pacific Railroad now in progress under specific acts of the Manitoba Legislature, as well as an act of the Parliament at Ottawa. Duluth, therefore, it is proclaimed, "is to become the lake outlet for the great and growing Canadian Northwest." The Duluth Herald says: "The Northern Pacific, whose transcontinental line from Duluth to Tacoma is the main competitor on through traffic with the Canadian Pacific, will at once be an active competitor for the local business of the great and fertile valleys of the Assiniboine, the Saskatchewan and the lower Peace rivers. It is no secret that the Grand Trunk is behind the Northern Pacific in both these extensions and others, and the two roads will work together in competition with the Canadian Pacific."

The New York Chamber of Commerce suggests that a business man should be appointed to the vacancy on the Interstate Commerce Commission.

The Anchor Line Steamship Company have taken possession of their recent purchase on the water front in Brooklyn, comprising the Kelsey stores and Union stores and three long piers. The cost of the property is \$500,000.

Stanley and Emin Pacha are said to be in possession of 3,000,000 francs' worth of ivory, with which they are approaching Zanzibar.

The new building for the Manufacturers' Club, in Philadelphia, has been completed at a cost of \$250,000. The interior woodwork and decorations are of an elegant description and the electric heating and sanitary arrangements are believed to equal anything in the United States. The front is entered by a broad arched doorway, with an elegant stairway of oak fully in view, and is peculiar from having a three-deck balcony of heavy stone.

Florida orange growers say the next season's crop will be doubled and they begin to fear that the market will be surfeited.

The largest taxpayer in Germany is Herr Krupp, the Essen gun-maker, who pays £6480, on an income of £219,000; and next comes Baron Willy de Rothschild, of Frankfurt-on-Main, with an income of £205,000 and a tax of £5940. The greatest income returned by a resident in Berlin is £123,000. There are three others whose incomes vary from £48,000 to £57,000, and there are six more who have upward of £30,000 a year each. There are also 166 persons in Berlin whose incomes are between £6000 and £10,000.

There were 45 ocean vessels in Puget Sound at the opening of the season.

The depreciation in the value of Western stocks, which has occurred within the last 12 months, fully accounts for the depression in some departments of speculative trade, of which so much is said. One of the commercial writers for the daily press makes the following record, to show the shrinkage in value from the highest prices in 1888 to the prices now current:

Atchison.....	\$44,250,000
Chicago and Alton.....	1,411,000
Burlington and Quincy.....	30,400,000
St. Paul, common.....	6,400,000
St. Paul, preferred.....	3,570,000
Northwest, common.....	5,300,000
Northwest, preferred.....	2,500,000
Rock Island.....	11,000,000
Missouri Pacific.....	11,250,000
Union Pacific.....	5,400,000
Total.....	\$121,481,000

# The Iron Age

New York, Thursday, April 11, 1889.

CHAS. KIRCHHOFF, JR., - EDITOR.  
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.  
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.  
JOHN S. KING, - - - BUSINESS MANAGER.

## The Freight Agitation.

The agitation among iron producers over irregularities in the freight rates in different parts of the country is spreading. It is true that vigorous protests have been made for some time by the producers of some sections, a notable instance being the work done by the Mahoning Valley Iron Manufacturers' Association. But at no time has the question so profoundly stirred so wide a territory. Producers in Ohio, Eastern and Western Pennsylvania, New Jersey and New York are thoroughly aroused. From every quarter come complaints of serious discrimination, backed by facts which the railroad managers cannot afford to ignore. The principal impulse, so far as the pig iron manufacturers of the East and some in the West are concerned, has come from the sharp competition of the Southern makers. But a study of the subject has revealed many irregularities in other directions, aside from the contest between the rail-makers of Pittsburgh and Chicago.

Taking up first the question of Southern rates of freight for long distances, official data enable us to compile the following table, the rates to points north of the Ohio and west of the Mississippi River being made on the basis of the Southern rates to Ohio and Mississippi River points plus the arbitraries from those points, which are fixed by the lines north and west thereof:

### Southern Rates on Pig Iron from Birmingham, Ala.

To	Distance. Miles.	Rate 2268 pounds.	Per ton per mile. Cents.
Cincinnati.....	478	\$3.75	0.55
Louisville.....	394	2.50	.62
Evansville.....	364	2.75	.74
Cairo.....	359	2.75	.76
Memphis.....	251	2.00	.79

### From Chattanooga, Tenn.

Cincinnati.....	335	\$2.25	.69
Louisville.....	311	2.25	.72
Evansville.....	306	2.50	.81
Cairo.....	347	2.50	.72
Memphis.....	310	2.00	.60

On finished iron we have the following rates:

### Southern Rates on Manufactured Iron from Birmingham.

To	Distance. Miles.	Rate 100 pounds.	Per gross ton per mile. Cent.
Cincinnati.....	478	\$0.12	0.56
Louisville.....	394	.11	.62
Evansville.....	364	.12	.73
Cairo.....	359	.12	.75
Memphis.....	251	.09	.80

### From Chattanooga.

Cincinnati.....	335	.10	.67
Louisville.....	311	.10	.72
Evansville.....	306	.11	.80
Cairo.....	347	.11	.71
Memphis.....	310	.09	.65

Of course it must be considered that the Cincinnati and Louisville rates are the most important, since the quantities shipped to those points are the greatest.

Let us compare these figures with those of Western Pennsylvania and the Mahoning Valley:

### Rates on Pig Iron, Western Pennsylvania and Ohio.

Distance. Miles.	Rate. Gross ton.	Per ton per mile. Cents.
5.....	\$0.247	4.94
6.....	.247	4.12
9.....	.247	2.74
15.....	.48	3.20
41.....	.80	1.95
49.....	.80	1.63
58.....	.94	1.62
68.....	.79	1.16
70.....	.80	1.14
74.....	.79	1.07
76.....	.80	1.06
80.....	.80	1.00
487.....	2.20	0.47

Some rates on materials are as under:

### Rates on Raw Materials.

Distance. Miles.	Iron Ore. Rate. Gross ton.	Per ton per mile. Cents.
58.....	\$0.725	1.25
121.....	1.10	.90
137.....	1.20	.87
148.....	1.20	.84
180.....	1.00	.56
193.....	1.60	.83
Mill Cinder.		
45.....	.50	1.11
49.....	.70	1.43
60.....	.70	1.17
74.....	.70	0.95
103.....	1.02	1.00
Coke.		
75.....	1.00	1.33
127.....	1.51	1.19
Limestone.		
16.....	.35	2.19
18.....	.30	1.67
118.....	.80	0.67
124.....	.80	0.64
148.....	.85	0.57
Muck Bar.		
40.....	.91	2.27
172.....	2.24	1.30
202.....	2.89	1.10
Steel Billets.		
157.....	2.91	1.85
180.....	1.68	1.05
172.....	2.24	1.30

So far as pig iron is concerned the hauls are all relatively short, while the data on long distances show rates as low as those of Southern makers. On the whole producers do not complain of the rates paid on transportation less than 25 miles, but from that distance upward to 100 miles the charges are relatively exorbitant and should certainly be reduced 25 per cent.

On materials the most outrageous rates on hauls of moderate distances are those on coke. Our figure for the distance of 127 miles practically covers the Mahoning and Shenango Valley districts.

A manufacturer of Bessemer pig in the Shenango Valley sends us data which enable us to tabulate the freight cost per ton of product as follows:

Material	Lake ore.	Coke.	Lime- stone.
Distance.....	80	127	18
Freight per ton.....	\$0.724	\$1.51	\$0.30
Freight per ton per mile.....	0.904	1.194	1.674
Quantity per ton of iron.....	1.6	1.25	0.5
Freight cost per ton of iron.....	\$1.16	\$1.89	\$0.15

This makes a total of \$3. Now, if the rate per mile were reduced to 0.65 cent on ore and coke and that on limestone to 1.5 cents, the total freight cost would be reduced to \$2. The haul to the principal market—Pittsburgh—a distance of 70 miles, is now 80 cents, or 1.14 cents per ton per mile. At 0.75 cent per mile there would be a reduction in this item of 28 cents.

A striking instance of the payments for freight as an item of cost of manufacturing pig iron is cited by an Eastern furnaceman. The consumption of raw material per ton of product is 4.175 gross tons. Although one-half of the ore is hauled only a distance of eight miles, and

the balance less than 25 miles, although the haul on the limestone is only eight miles, and the anthracite coal comes a distance of 100 miles, the freight cost is over \$3 per ton.

No clearer statement of the grievances of the manufacturers of the Mahoning Valley can be presented than the following letter from J. H. Sheadle, secretary of the Mahoning Valley Iron Manufacturers' Association:

The question of high freight rates is becoming a serious matter with us, and the disposition of *The Iron Age* to open its columns to a discussion of freight rates is a matter for much congratulation on the part of the ironmasters of the Mahoning Valley. Adopting the term used by Andrew Carnegie when expressing a condition of the iron business of the State of Pennsylvania, "We are at the mercy of the railroads." With our markets constantly shifting, and some of our more natural markets slipping away from us, perhaps never to be regained, the conditions that confront us are full of the greatest moment. It is not the purpose of the writer to more than present a few facts, for these facts are far more expressive than words. Some idea of the disadvantage under which this section labors by reason of the high and unequal tariffs maintained by the railroads may be gleaned from the following data: In the matter of coke rates, the present tariff on this commodity from the ovens to Chicago, a distance of 528 miles, is \$2.75 per ton, or 0.52 cent per ton per mile, while the rate to the furnaces in the Mahoning Valley is \$1.35 per ton for a distance of 130 miles, or 1.04 cents per ton per mile.

The rate on ore from the lakes to the valley furnaces, a distance of 67 miles, is 72½ cents, or 1.07 cents per ton per mile, while the railroads haul this freight from the lakes to the Hocking Valley, a distance of, say, 170 miles, for 85 cents per ton, or 0.50 cent per ton per mile. Coal is another commodity in which we are greatly discriminated against in the matter of freight. The rates on coal to all points from the Pittsburgh district are made from Pittsburgh as the center of a 40-mile radius. The rate from this district to the valley, a distance of 65 miles, is 70 cents per ton, or 1.08 cents per ton per mile. The discrimination here lies in the fact that this coal is hauled over the same tracks through this valley to Cleveland, a total distance of, say, 132 miles, for 90 cents per ton, or 0.68 cent per ton per mile. In other words, coal is hauled from Youngstown to Cleveland, 67 miles, for 20 cents per ton additional to the rate paid on coal destined for Youngstown. These are some of the differences in freight charges on material entering into the manufacture of iron. Now, let us make some comparisons of pig iron tariffs.

The rate charged by Southern roads on pig iron from Birmingham to Cincinnati, a distance of 478 miles, is \$2.75 per ton, or 0.57 cent per ton per mile, while from Youngstown to Philadelphia via Pennsylvania lines, a distance of 419 miles, the rate is \$2.70, or 0.69 cent per ton per mile. Taking a short haul—for example, from Birmingham to Atlanta, a distance of 168 miles—the rate is \$1.35 per ton, or 0.82 cent per ton per mile, while the rate from Youngstown to Marion, Ohio, a distance of 156 miles, is \$1.40 per ton, or 0.90 cent per ton per mile.

Another flagrant case of discrimination may be found in the following comparison: The rate from Albany to Chicago is

\$2.80 per ton for a distance of 840 miles, or 0.33 cent per ton per mile, while the rate from Youngstown to Boston, a distance of 690 miles, is \$4.30 per ton, or 0.64 cent per ton per mile. The writer could go on indefinitely making comparisons such as above, but these will suffice. As a result of the lack of foresight manifested by the railroads in this section by placing upon our traffic "all that it will stand," the large amount of pig iron formerly going to Chicago and the West by the train load has been cut off almost entirely, indeed, amounting so far in 1889 to but six-tenths of 1 per cent. of our output. The same forces are at work in manufactured iron.

Since the advance in freight rates of the first of this year the percentage of manufactured iron heretofore shipped into the West and Northwest from this Valley has been reduced one-half. The mills receive inquiries from these sections, but too frequently the buyer replies "your prices are satisfactory, but the rate of freight precludes acceptance of your quotations." It behooves the railroads to look into the future further than across the width of a freight bill and not continue the present burdensome tariffs until such time as it is everlastingly too late.

Mr. Andrew Carnegie has voiced Pittsburgh interests in a letter to the Pittsburgh *Dispatch* which we print below:

To bring the matter distinctly before the citizens of Pittsburgh I make the following statement:

1. The Pennsylvania Railroad Company bring a train load of coke from Connellsville mines to the city of Pittsburgh; the cars belong to the shipper and are loaded and unloaded by him. The Pennsylvania Railroad Company only haul the cars; the engines and crews that haul them stop at Pittsburgh. Upon this coke if destined for Chicago furnaces the Pennsylvania Railroad Company's share is 30 cents per ton. Should the coke be destined for Pittsburgh furnaces the Pennsylvania Railroad Company charge 70 cents per ton. In both cases the Pennsylvania Railroad Company have performed exactly the same service. There is no question of longer or shorter haul or terminals. If any man can show that a train load of such coke coming from Connellsville to Pittsburgh destined for Pittsburgh costs the Pennsylvania Railroad 1 cent more than a train load of coke destined for Chicago for the service performed to Pittsburgh, let him do so.

2. A train load of ironstone is carried to Hocking Valley furnaces from the lakes, a distance of 175 miles, for 85 cents per ton. If a train of similar ironstone is brought from the lakes to Pittsburgh, a distance of 150 miles, the charge is \$1.25 per ton. These two overcharges sum up as follows per ton of iron:

One ton of coke required per ton of iron, overcharge to Pittsburgh, as against Chicago	\$0.40
One and six-tenths tons of ironstone required to make 1 ton of Bessemer pig iron, overcharge to Pittsburgh, as compared with Hocking Valley furnaces...	.72

\$1.12

The amount extorted by the Pennsylvania Railroad Company upon Pittsburgh traffic over and above what is charged to furnaces beyond the State being thus \$1.12 per ton of iron.

The rate charged by the Baltimore and Ohio Railroad Company upon ironstone from lakes to the Hocking Valley furnaces is now the usual rate upon ironstone. The railroads centering in Chicago carry it from Lake Superior mines at the same

rate per ton per mile—viz.,  $\frac{1}{2}$  cent. The distance to the Chicago turnarounds from the Superior mines is greater than from the lakes to Pittsburgh, but the railroad companies take back the cars empty from Chicago, while from Pittsburgh the railroad company gets loading back with coal.

I give only these two instances to prove my statement that every ton of pig iron manufactured in the Pittsburgh district is overcharged by the Pennsylvania Railroad monopoly \$1 per ton. Upon every ton of finished iron shipped East or West from Pittsburgh (except rails) is overcharged from 50 cents to \$1 per ton. It is by such means the Pennsylvania Railroad have built up their surplus fund to \$19,000,000, and extracted from the State of Pennsylvania last year \$4,000,000 more than their interest and dividend. If Pittsburgh stands this it will stand anything. I do not believe it will stand it long. Indeed, it cannot stand it long.

*The Iron Age* is not the champion of any one section as against any other. Justice to all and a fair opportunity to every district is what must be contended for. We believe, however, that we have shown that great injustice is being done in one way or another to the majority of producers north of the Ohio and the Potomac. We believe that the data we have already presented have proved that for hauls over moderate distances, say between 50 and 150 miles, the rates paid are at least 25 per cent. too high. They must come down, and come down quickly, too. A similar state of affairs exists so far as rates on manufactured iron are concerned, with which we shall deal in a future issue.

#### The Sliding Scale for Wages.

In his speech to the workmen, at Brad-dock, on the 30th ult., Mr. Andrew Carnegie referred in terms of the strongest commendation to the sliding scale system of paying wages which is now used in a number of the industrial enterprises with which he is connected. His words of praise for the system, strong as they were, are entirely warranted, not only by his experience, but by that of others who have succeeded in inducing their workmen to accept it. The foremost practical advocate of the system in the iron trade for years has been Mr. O. W. Potter, of the North Chicago Rolling Mill Company, who has, with a steadfast persistence born of faith in its perfect equity toward all interests involved, endeavored to secure its adoption throughout his entire works. In this he has been measurably successful, his largest plant being operated in this way exclusively. Fifteen years since Mr. Potter had introduced a sliding scale which promised to work most satisfactorily, when the agreement was annulled by the wave of sentiment for national organization which swept through the ranks of ironworkers everywhere. Few mills were able for a long time afterward to make separate arrangements with their working force which involved a radical departure from the scheme of national organization. In 1885, however, Mr. Potter succeeded in convincing his employees that the method of establishing a fixed basis of wages once a year for the ensuing twelve-months was not productive of as good results for them or him as a sliding scale which would change from month to month

as prices fluctuated. As soon as prices advanced, he argued, wages also should advance, while in case of a decline it was only fair that all should participate in the lessening of profits, the workmen as well as the mill owner. Costly strikes, too, through which the workmen had gone, in their endeavor to regulate their own wages, had set them to thinking.

The agreement which was made for the South Chicago works of the North Chicago Rolling Mill Company in 1885, based on the selling price of rails, is in force to-day with some slight modifications rendered necessary by the lapse of time. At first only the workmen in the rail and steel departments were covered, but now the furnacemen and other employees are included, and the system may be said to have been perfected at these works. The agreement, which was signed by the officers of the company and a committee representing the men, was exhaustive, covering the arrangement of the scale on a proper basis, the time of advance notice to be given should either party desire to abandon the system, the method of fixing the price of rails to govern the wages for each month, and the selection of an arbitration committee to pass upon any disputed point, whose decision should be final upon both parties. The error was not committed of establishing a minimum rate below which wages should not diminish, but the scale was continued low enough to cover the lowest possible point of depression in price, while it was carried high enough to embrace "boom" rates. The sheets devoted to this scale and setting forth the exact wages of each class of workmen at each change in the price of rails are very large, and demonstrate the intricacy of the problem which in this case has been so happily solved for both men and employers. No annual period of strife and contention over wages is now looked forward to, no danger of a strike or other labor trouble now looms up to interfere with a contract, but the men eagerly anticipate an advance in the price of rails and an improvement in trade, because they will at once reap the benefit of it when the mill begins to roll the dearer rails.

The question may be asked, Who fixes the price each month on which the wages are to be based for that month? The workmen themselves have a share in this. Whenever rolls are changed the foreman of the rail mill posts up the name of the railroad whose rails will next be rolled. The workmen are thus posted on their work from day to day, or, if running on small orders, every few hours. At the end of the month a committee of the men is given access to the contracts for the rails which they knew to be rolled, and any other help is furnished which may be needed to aid them in securing full information as to the prices received. If special time on rails is to be given, that is taken into account and the interest deducted from the price. The point aimed at is to get the actual net rate realized at the mill on the rails rolled during the month. When that is settled the rest is easy. The schedules are made up for the several classes of men, and they are paid off at the rates fixed in the agreement.

It would seem to be not an insurmountable task to arrange a sliding scale to suit the products of almost any mill if both

the employers and their workmen could agree to adopt that system. But a fatal objection to it in some parts of the country would undoubtedly be the segregation of the workmen of each mill. As no two mills are precisely alike, no uniform scale could be adopted that would be applicable to an entire district, and organized labor would oppose any step which would tend to individualize the mills. In doing what he has done at South Chicago Mr. Potter has not antagonized trades unions, but, on the contrary, he has recognized them as far as he could in carrying the sliding scale system into effect. A committee of workmen is treated with as representing the men collectively, and they are not treated individually. In fact, at his Bay View mill, where bar iron and nails are manufactured, the rules of the Amalgamated Association are enforced and that organization's scale of wages is paid. It would certainly be more just to all parties if a sliding scale should be adopted there also, but as no effort is made to force its adoption Mr. Potter's position is plainly one of harmony and conciliation. Probably at this and other works, in the fullness of time, the influence of Mr. Potter and Mr. Carnegie, both enthusiastically in favor of the sliding scale, may secure its further trial and wider adoption.

#### Ten-Cent Copper.

Aside from conflicting rumors, nothing has thus far transpired in regard to the negotiations which have been going on in Paris since the delegates of the American mines arrived. It has been intimated that the proposal under consideration is to establish prices based on Chili bars at £40 in the London market, coupled with an agreement to reduce output to the extent of 20 per cent. The price stated would be equivalent to a shade over 10 cents for Lake copper here. Provided the leading miners all over the world undertake to faithfully abide by the restriction of production, and provided further that the banking institutions who hold the stock content themselves with marketing their accumulations slowly, say at the rate of no more than 40,000 tons annually, then the market would be on a safe basis for purchasers of the crude article and of manufactured goods. Unless these three conditions—a low price, a restriction of output and gradual marketing of the stock—go hand-in-hand, the trade will do well to touch everything connected with copper in a gingerly fashion. Prices went below £40 during the year when the speculators took hold, and then conditions were very different from what they now are. Stocks were light, consumption was heavy and many mines were on the brink of bankruptcy or had been forced to close down. Now the stock is over 100,000 tons greater, consumers are without confidence whatever and a number of producers have improved their financial position and have paid for betterments in plant and equipment.

However those who are attempting to modify the evils of the present situation may twist and turn, they will not be successful for any length of time in holding values above the 10-cent limit unless an extraordinary change takes place in the general business situation in this country and elsewhere. It is conceivable that the

long-predicted boom of 1890 may aid them, but for the near future it would be futile to hold the market above the limit which we have indicated. As it is, the very strength of the parties in control has prevented the tumble to £30 which many expected to see when the speculation collapsed.

No one in the copper trade, from the manufacturer who buys millions of pounds annually to the merchant who sells moderate invoices of finished goods, wants to struggle through the anxieties and losses of a demoralized market. But all will welcome a return to a sound basis.

During the past few months a number of newspapers throughout the country have been discussing the point as to whom the important post of superintendent of the next census should be intrusted. The one most prominently mentioned has been Joseph D. Weeks, for many years associate editor of *The Iron Age*, and for some time past editor of the *American Manufacturer* and *New World*, of Pittsburgh. Mr. Weeks has been long identified with statistical research in special fields, he has been the author of an important report on labor in Europe and has been a thoughtful student of the industrial development of this country, generally speaking, and possesses that wide knowledge of the *personnel* of the leading trades to enable him to choose his associates wisely. Mr. Weeks deserves and will receive the indorsement of his friends in the iron and allied trades.

#### The Blast Furnaces on April 1.

There has been a slight decrease in the productive capacity of the coke furnaces blowing, in spite of the growing output in the South. The anthracite furnaces are about holding their own. The changes during the month develop no features pointing to any general tendency, though it must be a matter of surprise that in the unsatisfactory condition of the markets production continues so very heavy.

On the 1st of the month the status of the Anthracite furnaces was as follows:

##### Anthracite Furnaces April 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	24	11	3,557	13	3,792
New Jersey.....	13	5	2,180	8	2,392
Spiegel.....	3	3	233	0	0
Pennsylvania:					
Lehigh Valley.....	44	25	9,229	19	5,610
Spiegel.....	1	1	76	0	0
Schuylkill Valley.....	38	24	8,862	14	4,120
U. Susquehanna Valley.....	17	11	3,644	6	1,256
Lebanon Valley.....	16	12	5,528	4	1,912
L. Susquehanna Valley.....	22	10	4,058	12	4,320
Total.....	178	102	37,977	113	23,402

For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
April 1.....	102	37,977
March 1.....	103	37,937
February 1.....	107	39,187
January 1, 1889.....	107	38,723
December 1, 1888.....	99	34,879
November 1.....	95	33,645
October 1.....	95	33,723
September 1.....	92	33,541
August 1.....	93	33,397
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,003
April 1.....	94	30,496

There is nothing to report from the New York furnaces, the good record of Port Henry No. 2 having been alluded to in *The Iron Age*. We may note, however, that the Manhattan furnaces are to be abandoned. The one still running is merely working up stock, which will take till the middle of May, while the other is already being dismantled. In the Schuylkill Valley there were no changes during the month, though Warwick is soon to go out. In the Lehigh Valley Durham has again blown in and one of the Bethlehem stacks resumed. In the upper Susquehanna Valley Lackawanna is now running its five furnaces. Irondale blew out on the 2d of this month, to make repairs. In the Lebanon Valley one of the Colebrook furnaces has stopped; the second Bird Coleman, which has been undergoing repairs, started early this month.

The month opened with the following capacity working:

##### Coke Furnaces April 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	3	1	1,150	2	2,300
Pennsylvania:					
Pittsburgh district.....	18	17	20,886	1	850
Spiegel.....	1	1	585	0	0

Juniata and Conemaugh Valley.....	18	12	6,052	6	2,150
Spiegel.....	1	0	0	1	430
Yough Valley.....	5	4	1,612	1	600
Miscellaneous.....	4	4	2,339	0	0
Maryland.....	1	1	350	0	0
West Virginia.....	6	3	2,611	3	538
Ohio:					
Mahoning Valley.....	14	11	8,988	3	2,517
Central and Northern.....	18	12	8,574	6	4,524
Hocking Valley.....	14	7	2,301	7	2,358
Hanging Rock.....	13	8	1,910	5	1,210
Indiana.....	2	2	431	0	0
Illinois.....	12	6	7,115	6	5,515
Spiegel.....	1	1	670	0	0
Wisconsin.....	4	2	1,293	2	1,100
Missouri.....	6	2	1,046	4	1,590
Colorado.....	2	1	490	1	450
The South:					
Virginia.....	12	7	3,144	5	3,125
Kentucky.....	4	4	1,280	0	0
Alabama.....	24	20	11,678	4	1,850
Tennessee.....	11	9	4,241	2	790
Georgia.....	2	0	0	2	778
Total.....	215	151	100,060	64	34,459

As compared with previous months, these figures stand as follows:

	No. of furnaces.	Capacity per week.
April 1.....	151	100,060
March 1.....	150	100,757
February 1.....	150	98,518
January 1, 1889.....	157	108,726
December 1, 1888.....	151	101,748
November 1.....	146	94,695
October 1.....	137	85,461
September 1.....	133	81,082
August 1.....	122	74,855
July 1.....	121	69,543
June 1.....	123	75,427
May 1.....	130	75,815
April 1.....	123	70,644
March 1.....	123	68,892
February 1.....	136	73,912
January 1.....	143	83,101

In the Pittsburgh district we may note that No. 2 furnace of Laughlin & Co. has been blown out for relining. The new stack being built by the same firm will probably be ready to make iron about the middle of May. In the Shenango Valley Neshannock, a large furnace, completed general repairs during the month and blew in on the 23d ult. In the Juniata and Conemaugh district the second Rockhill was added to the list of producers, while among the furnaces grouped under miscellaneous Cameron started again on the 12th ult. Among the furnaces of Central and Northern Ohio it is to be noted that Jefferson stopped, but, on the other hand, Steubenville resumed in March. In the Mahoning Valley Haselton lost two days through a strike in March. In the Hocking Valley Glasgow was again at work. In Illinois one of the South Chicago stacks is idle. The output of the State was 35,704 gross tons.

In the South the principal facts of note are the blowing out of Crozer and No. 1 Longdale and the stoppage of work at Rising Fawn, Ga. In Alabama the fourth of the famous Ensley plant, of the Tennessee Coal, Iron and Railroad Company, started in March, but, on the other hand, one of the South Pittsburg, Tenn., stacks of the same concern was blown out. The second DeBardeleben, at Bessemer, has been blown in since the 1st inst., and we understand that the two stacks together have reached a product of 225 tons a day. Trussville, according to the latest advices, had not yet blown in.

Returns from the charcoal furnaces are not yet sufficiently complete to submit the totals. We may note, however, that returns from every maker in Michigan show a total output of 15,189 gross tons in March, so that the State is turning out iron at the rate of 3480 tons a week.

## OBITUARY.

FREDERICK SIBLEY.

Frederick Sibley, who has been connected with the Delamater Iron Works for nearly 40 years, died at his home, No 806 West Fourteenth street, 8d inst. He was born in Wales in 1822 and came to this city when a young man. He was at first employed in the Novelty Iron Works, but soon entered the Delamater Iron Works, where his brother was foreman of the foundry. At the breaking out of the war he became the foreman of the foundry and superintended the building of the Dictator and other gunboats for the Government. He was regarded by his employers as a mechanical engineer of exceptionally fine abilities.

E. P. ALLIS.

E. P. Allis, the millionaire manufacturer of Milwaukee, Wis., died suddenly on Monday evening. He was known all over the country and in Europe as the proprietor of the Reliance Works, one of the largest establishments for the manufacturing of steam and mill engines in the world. His death was wholly unexpected, as he had been in excellent health up to Sunday. He was taken with an attack of neuralgia of the stomach, which terminated fatally. Mr. Allis was born in Cazenovia, N. Y., May 12, 1824, was graduated from Union College in 1845 and left for the West at once. He was a member of the firm that built the large tanneries at Two Rivers, Wis. In 1860, with C. D. Nash and John P. McGregor, he purchased the old Reliance Works, then doing a languishing business. Before the close of the first year he purchased the interests of his two partners, and from that time on engaged in building the Reliance Works up to their present immense proportions. His fortune is up in the millions.

HARVEY P. GASKILL.

Harvey P. Gaskill, inventor of the Gaskill pumping engine, died in Lockport on Monday night. He was the vice-president and chief engineer of the Holly Mfg. Company, widely known for the Holly water-works system. He was on Monday 44 years old, and born in this State.

PHILO REMINGTON.

Philo Remington, senior member of the firm of E. Remington & Sons, of Ilion, N. Y., died at Silver Springs, Fla., 4th inst., of bilious fever. He was 72 years old and had been enjoying unusually good health for a man of his age. Mr. Remington was born in Litchfield, N. Y., October 31, 1816, and when a boy obtained from a country blacksmith the privilege of using his forge on rainy days and evenings, and with such tools and appliances as his own ingenuity suggested produced a gun.

It proved so satisfactory that he was encouraged to continue and soon established his own forge, from which has developed the great factory now known as the Remington Armory. With his brothers Samuel and Eliphalet the firm was established, and it probably manufactured a greater variety of firearms than any other like establishment. In 1886 the firm went into liquidation. Since that time Mr. Remington has lived in retirement. For 20 years he was president of the village of Ilion and has given Syracuse University sums aggregating \$250,000.

## Lake Superior Charcoal Pig.

### THE FUEL SUPPLY OF THE FURNACES.

The result of our investigation into the condition of the fuel supply of the Lake Superior charcoal furnaces is confirmatory of the statements which have been made on this subject. An undoubted shortage exists at present at a very considerable number of the furnaces. And unless this shortage can be corrected by favorable conditions during the summer there will be a shrinkage from this and other causes of 25 to 80 per cent. in the output of Lake Superior charcoal pig iron. The information we have received on this subject is very full and complete and is probably as reliable as it is possible to make it thus early in the season. The low price of iron now ruling naturally imparts a feeling of depression to the entire trade, and almost forbids a display of energy which would in any degree increase expenses. If an advance should occur from any cause, it is very likely that ways would be found of covering at least a very considerable part of the fuel deficit. Most of the letters we have received are very short and their contents cannot be quoted. Those which enter into the discussion of the question to some extent are as follows:

#### LOWER PENINSULA OF MICHIGAN.

A Detroit furnaceman of much prominence in the trade thus writes:

We buy our charcoal. Those from whom we purchase assure us that they are well stocked with wood. The managers of three furnaces here have told the writer that their plants were well stocked with wood. The quantity of iron made by the four furnaces located here will probably be less than last year, as two of them contemplate making alterations and repairs during the summer months. These alterations will probably consume more time than when making ordinary renewals. We may repair, but intend to run as long as our hearth will permit. If we go out for repairs we will make from 20 to 25 per cent. less than usual. If we have a well-assorted stock of iron on hand when ready to go in blast, with a light demand for the same, we would remain out until the assortment was broken or the demand improved. I should be glad to see an improvement in the demand and price of Lake Superior charcoal pig iron, but it is my candid opinion that if it is gotten up on the cry of short wood crop it will be at the expense of truth.

The manager of another furnace company in the same locality sends us the following:

We beg to say that we do not make any charcoal ourselves, but buy all that we consume from contractors. Thus far we have had no difficulty in obtaining an abundant supply, and do not anticipate any shortage during the summer that will affect our product. The other furnaces in our vicinity derive their supply largely from the northern part of the State, where, though there has not been as much snow as usual, there has been enough for a person with ordinary energy to obtain a supply of wood.

The treasurer of another furnace company in the southern part of the State sends us the following information:

We would say that, from the causes you mention and others, our production is liable to fall short 2000 tons this year.

From the same locality comes the following communication, which, though brief, states an important fact having its bearing on the situation:

At about one-half of our kilns, situated in the northern part of the State, we purchased our usual supply of wood. At the southern kilns, however, we are about 2000 cords behind last season. It is likely we will make from 3000 to 4000 tons of iron less this season than usual.

The other replies received from this section were short, and merely covered the interrogations sent out. The Iron Star, Frankfort, Bangor and Caseville furnaces, which are still carried in the list of active furnaces, will not be operated this year. Of these, the Bangor was the only furnace making iron last year, and to the extent of its production this season's output will be reduced.

#### THE UPPER PENINSULA OF MICHIGAN.

The manager of one of the best-known furnaces writes us as follows:

At most of our kiln jobs our supply of wood for charcoal is about 25 per cent. under what we usually have at this time of the year. If we should have a wet season, which would prevent the drawing in of wood on wagons, the restriction of pig iron will naturally be in about the same proportion. We hope to be able to get in some wood during the dry months of the summer to relieve us and make up our deficiency. Still, I am inclined to think that the product of charcoal pig iron this year will be less than last.

The superintendent of a neighboring furnace writes that his stack will be blown out this summer and that the production will fall short of that of 1888 by about 3000 tons. Of the other furnaces, some have secured all the wood they need, while some are short of fuel, with hardly a possibility of getting a sufficient supply during the summer. The Jackson made iron last year, but will make none this year if present conditions continue. The Iron River has changed hands, but it is doubtful if it will be started up. The Menominee Furnace, which is still carried on the active list, may safely be considered abandoned.

#### WISCONSIN.

The charcoal furnaces in this State are generally short of wood from 20 to 25 per cent. A letter from one of the fortunate possessors of a good supply is as follows:

So far as this furnace is concerned, its supply of wood is deemed all-sufficient to enable it to run without interruption throughout this year at the rate of 1600 to 1800 tons of output monthly. The situation of the charcoal pig iron market is certainly bad enough. There seems little hope of any improvement in the near future. Among the furnaces, only the fittest are likely to survive. Possibly after the season's prices for ores are known a better outlook may become apparent. Within a month the worst, in this regard, will be known. The outlook is not favorable to an increase over last year's prices, as miners of ores must see very soon if they want to make sales.

Another furnace manager writes that the short supply of fuel which he has secured will cut down the production of his furnace at least 4000 tons. Other furnaces, which had previously depended on their own wood supply and charcoal kilns, have found it necessary to contract with outside parties to furnish them with charcoal, which will of course cost them more than if they had been able to cover their own wants. The Appleton Furnace, which was burned down last year, will not be

rebuilt, so that its production is eliminated from this year's output. The Fox River Furnaces, which have not been in blast for several years, are now being torn down and their machinery is being sold for scrap. The Florence Furnace has also been permanently abandoned.

#### SUMMARY.

It will not escape the attention of well-informed readers that improvements have been made in charcoal furnace practice which will largely increase the average output per stack as long as fuel can be had in sufficient supply. This is a matter to be considered in calculating the probable decrease in production of the entire region. It will be found, however, on careful investigation that the best furnaces have not all been favored with a bountiful supply of fuel, and therefore fast driving is hardly to be an event of conspicuous moment this year, unless prices so advance that the cost of material need not be figured quite so closely as at present. But allowing for all such influences, the information we have collected points to a reduction of at least 25 per cent. and probably 30 per cent. as compared with last year. The tonnage thus promising to be cut off is quite considerable. In 1887 Michigan produced 190,000 gross tons of charcoal pig iron and Wisconsin 42,000 tons, or a total of 232,000 tons. In 1888 Michigan again produced 190,000 tons, while Wisconsin turned out 62,000 tons, or a total of 252,000 tons. If this should be reduced 25 per cent. the falling off would be 63,000 tons, and 30 per cent. would be 75,000 tons. It is hardly possible that such a shrinkage would take place without materially stiffening prices, although the full effect might not be felt until some time in the summer or fall, after the usual season contracts for pig iron had been made by the large consumers.

## CORRESPONDENCE.

### Commissions on Canceled Contracts.

*To the Editor:* We beg to ask your opinion in regard to the question of settlement of commissions due on contracts for pig iron made for the account of furnace companies we represent. As a case in point, we would say that we are agents for certain furnace companies, and for them make contract for delivery of several thousand tons of iron, to be delivered in certain quantities at stated intervals. Now, if through no fault of ours this contract is canceled by either party, and that party going beyond the provisions granted in the terms of the contract as reasons for cancellation, are we not then entitled to our commission? Your reply will oblige

Yours very truly,

H. S. JACKSON & Co.

The right of the agent to his commission arises as soon as he renders the service for which he was employed. When he has done all that he was required to do and performed his part of the transaction, and the agreement between himself and his principal leaves no other material act or service to be accomplished, the agent, broker or factor is entitled to receive his commissions, without regard to the future conduct of the parties whom he represented and whom he has brought together. To apply this general rule to the case in question, where the agent or middleman is employed to make contracts of sale, to bring together seller and purchaser and under the powers conferred upon him by the seller to fix the terms of the sale, the price, the term of credit, the place of delivery and similar details—for such, we would infer, is the authority of an agent

employed for such a purpose—the agent's work is done when this contract is completed and perfected. He becomes entitled to his commission at once, and the fact that the buyer does not pay the price, or that either or both of the parties refuse to abide by their contract or mutually agree to cancel it, cannot affect the broker's right to his commission.

It may be remarked here that one party to a contract cannot cancel it without the consent of the other party. Either party may, of course, refuse to fulfill his promise, but the contract remains valid, and he who withdraws does so subject to all the penalties which the law provides for breach of contract. Nor does the agent's or broker's right to his commission depend on the question as to which party withdraws. If the seller for any reason after the contract is made sees fit to repudiate it, it is quite plain that his act cannot work to the injury of his agent. We believe every one will admit this without hesitation. Any other rule would simply destroy any legal claim on the part of an agent to a commission, as the principal would always have it in his power to avoid the payment of the commission by rescinding or pretending to rescind his contract. But it might be thought that this rule would not apply so strongly and cogently to the case of the purchaser who refuses to carry out his agreement. He is some one whom the agent has found and selected, and the seller might feel disposed to insist that the broker should be responsible for him, and that the commission should depend on the purchaser's proper fulfillment of his agreement. In other words, if the latter refused to pay or to accept the goods, the broker should lose his commission. But, on the other hand, the broker is employed to do a specific thing—to make the contract of sale—and his compensation for his services is usually contingent upon his success. If he renders the service, and has done all that lays in his power within the terms of his employment, he should not be held responsible for a breach of the contract occurring without his fault and beyond his control.

The infallible test to be applied to any case in which this question may be in dispute would seem to be this: What is the service for which the agent has been employed? Has he accomplished it? If so, he is entitled to his commission. The responsibility for the future relations of the seller and the purchaser rests with themselves. These views are confirmed by the adjudications of the highest appellate courts of the States. In New York it was held that where a broker was employed to sell land, and made a proper bargain or contract of sale, he was entitled to recover his commission, although the purchaser subsequently refused to take the title or pay the purchase price. In another case where goods were sold to arrive on a certain vessel by a broker employed by the seller for that purpose, he was awarded his commissions on the sale, although the goods as a matter of fact never did arrive. There may be a limitation of this rule if any element of fraud enters into the transaction. The contract of sale effected by the agent must be an honest, *bona-fide* contract. It should not be made with irresponsible parties, merely for the purpose of enabling the agent to claim a commission. The

agent must exercise the same judgment in these matters as a prudent business man would in his own business. The law would not tolerate a claim for an agent's commission on contracts of the kind if these contracts were reckless and improvident and not likely to be carried out by the purchaser. It should always be remembered also that the instructions of the principal must be scrupulously followed by the agent. A deviation from them in a material point would undoubtedly destroy the claim for a commission, and this probably whether the contract was accepted and carried out by the principal or not, or whether the principal suffered any appreciable damage or otherwise.

We have hitherto been treating of the agent's general right to his commission, in the absence of any special agreement between the agent and the principal as to that subject. Any definite arrangement between them would, of course, govern, and so far modify the general rules. These general rules are the provisions of the law for cases where there has been no special agreement. The principal and his agent may agree, for instance, that the commission shall be paid only in the event of the completion of the purchaser's contract, or that the commission shall be a percentage of all moneys received by the seller on contracts made by the agent. Whatever the terms of this arrangement may be, they will control the rights of the parties, and will vary in each particular case, so that no definite rule can be laid down in regard to them.—EDITOR.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., April 9, 1889.

Mr. Scott, president of the Union Iron Works, of San Francisco, speaking of shipbuilding on the Pacific Coast, says that the results in the production of high standards of steel at San Francisco have been better than in the East. When asked how he accounted for that, he said: "In the East the manufacturers use poor material and supplement it with skill. On our coast we use only the best materials." He says that the Charleston is now in the hands of the Government inspectors. The San Francisco will be ready for launching in August. Mr. Scott further says that since they began work on the Charleston they have turned out 13 steel vessels for the merchant marine of the Pacific, one of them for the Canadian Pacific Railroad. He thinks that iron and steel shipbuilding has a great future on the western shores of the continent, and claims that San Francisco will now hold the relation to the shipbuilding industry of the Pacific that the Delaware does to that of the Atlantic.

The Secretary of the Navy has no idea of undertaking the administration of his important department without first informing himself as to some of the salient points and details of its work. During the past week Secretary Tracy has been giving his attention to the condition of the navy yards at Washington, League Island and Brooklyn. He proposes also to inspect the navy yards at other points. The Secretary, in conversation, says: "It is now time for the Government of the United States to inaugurate a system of naval reconstruction which will place the United States on a par with the most formidable powers of the globe. Within the past two or three years the Government has had its pride considerably humbled when considering the probability of war with

Great Britain on the fisheries question, and more recently during a similar condition of affairs with Germany in regard to Samoa." He said that he did not see why the United States, the only nation in the world reducing the principal of its national debt, with a surplus of \$100,000,000 in the Treasury and with redundant revenues, should not embark at once in the building of a large fleet of steel cruisers and armed vessels, with armaments consisting of guns of the highest power and appliances of destruction more formidable than any known to the other governments of the world. The Secretary is in favor of the authorization of the expenditure of \$15,000,000 or \$20,000,000 a year for a series of years for war ships, so that in case of further repetitions of war-like situations the Government may be in a condition to conduct its negotiations without feeling the demoralizing influence of an inability to proceed at once to war should the peaceful methods of diplomacy fail.

Charles Cramp, of Philadelphia, and Mr. Scott, of the Union Iron Works, San Francisco, who are bidders for the new coast defense ship, have had several conversations with the Secretary of the Navy in reference to the details of their bids. The Cramps, of Philadelphia, were the lowest bidders, but made some exceptions in regard to the special designs for boilers. The award has been withheld until the heads of the bureaus make an investigation and report, which has been ordered by the Secretary. Mr. Cramp is not confident of the results from the form of boilers proposed, which at this stage are experimental. Mr. Scott accepts the plan and guarantees the results. The new ship, which is of monitor type, will be one of the most formidable fighting vessels afloat. The theory of construction, besides a maximum defensive strength, is an ability to sink the vessel in action, which simply exposes the turret and deck. It is proposed also to make her armament more powerful than that on any vessel of war. She will have a battery of the largest rifle guns in the barbettes, besides a dynamite bow gun of the greatest power and a full complement of guns, with the latest improvements in rapid firing. It is expected that it will require at least three years to complete the vessel.

The Terre Haute Iron and Nail Works, Terre Haute, Ind., have about completed two Smith gas heating furnaces, with working hearths 7 x 16 feet, together with the necessary gas-producers, flues, &c., plans for which were furnished by Alex Laughlin & Co., of Cleveland, Ohio. These gas-producers are divided into four independent batteries connecting with one main flue by means of independent flues. The latter are provided with gas-tight dampers, thus allowing any battery of producers to be cleaned without inconveniencing the furnaces from shortage of gas.

Milliken Bros., 61 Liberty street, New York, have issued a circular calling attention to the rolled-steel flooring plates for which they are agents. They state that they are able to make these plates from  $\frac{1}{4}$  inch to any thickness and almost of any desired size. The raised portion projects  $\frac{1}{4}$  inch from the surface of the plate, and adds about 2 pounds per square foot to the weight of an ordinary plate. For equal strength its weight is only about one-third or one-half of cast iron. They make ribbed, checkered and diamond plate.

The Greensburg Press has published an anniversary edition, which contains a number of articles dealing with the manufacturing industries of the town and its resources, among which coke and natural gas are prominent.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, April 8, 1889.

Lake navigation was resumed last week, the continued mild weather having opened the Straits much earlier than usual. Shipments of Ore began from Escanaba, and at other lake ports active preparations for business were made by the vesselmen. An impetus will necessarily be given to general business throughout the great extent of territory tributary to the lakes, which must have a favorable influence, as such a large number of men and such a variety of interests are now affected by the huge traffic on these inland seas. Railroad freight rates will very probably be reduced at an early day, to compete with water rates, but, as the volume of business will be increased by the resumption of all classes of outdoor activities, the roads may be even then in a better financial position than they now are. The hope for the future lies mainly in that direction. The railroads of this section are still purchasing supplies too sparingly to make the Iron trade reasonably healthy and vigorous.

**Pig Iron.**—Weakness in Southern Coke Iron developed to some extent during the past week. Low-grade Foundry, Gray Forge and Mill Irons were offered at rates to compete with local Coke Iron, but it is not certain that any large sales were made. Ohio Soft Irons were in moderate demand, and prices were sustained at old figures. Lake Superior Charcoal Pig showed some signs of life, two or three large consumers having made large contracts for considerable quantities. Concessions were obtained, according to report, but it is claimed at the same time that the cut was not heavy. Some of the companies state that they are willing to reduce prices slightly on small quantities for early delivery, but insist that they must get a higher price for contracts covering the year. They look forward to an advance by midsummer or a little later, and they want a share in it. The expected restriction of production from the short fuel supply and other causes is having an effect on those who are endeavoring to forecast the future. At the same time the very low prices now ruling for Coke Pig are conceded to be making an impression on the consumers of Charcoal, inducing them to substitute the former wherever practicable. A small cloud is appearing on the horizon also in the shape of Southern Charcoal Pig, which is now being offered here at rates below those asked for Lake Superior. If the quantity available for this market were not limited the effect on the Northern Charcoal Iron would be decidedly apparent. Cash quotations are about as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, \$17 @ \$17.50; Bay View Scotch, \$16.50 @ \$17; Lake Superior Charcoal, all numbers, \$19 @ \$19.50; American Scotch (Blackband), No. 1, \$18.50 @ \$19; Jackson County Silvery, No. 1, \$18 @ \$18.25; other Ohio Soft Irons, No. 1, \$17.25 @ \$17.50; Southern Coke, No. 1 Foundry, \$15.75 @ \$16.25; No. 2 Foundry and No. 1 Soft, \$15.25 @ \$15.75; No. 3 Foundry, \$14.75 @ \$15.25; Gray Forge and No. 2 Soft, \$14 @ \$14.50; Tennessee Charcoal, No. 1, \$19; No. 2, \$18.

**Bar Iron.**—Quite a good business has sprung up lately, and the mills are stiffer. Toward the close of the week inquiries were much more numerous, and large consumers are now feeling the market with a view to placing orders for their year's sup-

ply on the low basis now ruling. The belief grows more general that bottom has been touched for the present. Orders for nice specifications, including large proportions of light Irons, have been refused by mills at prices which would have been accepted gladly but a short time since. Shrewd buyers are anticipating a reduction in freight rates from the Valley, and ask for quotations at mill so that they will get the benefit of the reduction. The rate is now 13¢ @ 100 lb. The quotations for Chicago delivery of mill lots of Common Iron range from 1.60¢ to 1.65¢, half extras. Small lots are held from store at 1.80¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—Unusual activity is being displayed in the remodeling of business structures in this city, and small orders for Beams are consequently very numerous. Bridge stuff is still in light demand. Mill lots are quoted as follows, f.o.b. Chicago: Angles, 2.15¢ @ 2.20¢; Sheared Plates, 2.15¢; Universal Plates, 2.20¢; Tees, 2.50¢; Beams and Channels, 2.90¢. From store Angles are quoted at 2.30¢ @ 2.50¢; Tees, 2.70¢; Beams and Channels, 3¢ @ 3.40¢.

**Plates, Tubes, &c.**—A quiet week was experienced in this line. Some mill orders were taken and store trade was fair, but nothing worthy of special note occurred. Prices are unchanged.

**Sheet Iron.**—Quite a heavy inquiry is reported from large buyers, but the 1st of July is looming up in the distance with a possibility of complications in the adjustment of wages at that time, and the mills are stiffening on late deliveries. An advance of \$1 @ ton is asked by some of the mills. A fair quotation now seems to be about 2.95¢, f.o.b. Chicago, for mill lots of No. 27 Common. Small lots from store are sold at the rate of 3.10¢ @ 3.20¢ for No. 27.

**Galvanized Iron.**—The association of manufacturers has been disrupted by the withdrawal of one of their number, but as far as can be ascertained prices have not been changed. In view of the lack of harmony thus manifested this appears singular. Business in this section has been very quiet during the week just ended. Small lots are still quoted at 65¢ off for Juniata, and 65¢ and 2½¢ off for Charcoal.

**Merchant Steel.**—The improvement noted for the past three weeks gives no sign of abatement, but appears to be gradually widening, taking in a large circle of consumers of all grades. Prices are unchanged, being apparently very steady at former quotations.

**Steel Rails.**—Business for a month or more has been confined to small lots running from 500 to 2000 tons. One order of about 8000 tons has been practically secured for the local mills quite recently, and a great deal of work is in sight which will probably be decided upon within 30 days. The situation, therefore, cannot be considered either very discouraging or entirely satisfactory, but it appears to be improving, and the manufacturers are feeling more cheerful over the outlook. Quite a number of railroad projects, involving the purchase of large quantities of Rails, are taking shape, and will be launched as soon as the conditions are propitious. Quotations range from \$30 to \$30.50 for ordinary quantities.

**Old Rails and Wheels.**—A considerable quantity of Old Iron Rails was sold last week. The bulk of it brought \$20.50, which seemed to meet the views of those who are in need of this class of stock. One lot was disposed of at \$20.25 to distant parties, while another lot brought \$20.80. This active movement of the past 30 days has pretty well cleaned up stocks in this immediate locality. The Valley mills are in the market for Old

Rails, but at prices a little too low to take them from here. Old Car-Wheels have not been so dull for years. The Wheel manufacturers are taking a great many in exchange for new Wheels, so that they are not seeking any from outside parties. It is claimed by consumers that \$18 is a fair price for them, but holders ask \$19.

**Scrap.**—The market has again relapsed into dullness. Quotations are largely nominal in the absence of trade. No. 1 Forge or Railroad Shop is quoted at \$18.50 @ \$19, but there are no buyers, and some dealers are unwilling to pay more than \$16.50 for stock. No. 1 Mill is held at \$18.50 @ \$14  $\frac{3}{4}$  net ton from yard, and Machinery Cast at \$13, but further quotations are useless in the present state of the market.

**General Hardware.**—The demand for Shelf and Heavy Hardware keeps up very well. The general intelligence received from traveling men is very encouraging, and the prospects are very bright for a good year's trade in every section tributary to this distributing center. Thus far the Iowa railroad freight rates, which are reputed to be disturbing some branches of Chicago's wholesale trade, do not seem to have affected the Hardware interests. If they do it will probably become noticeable when trade is dull. The demand for Bicycles noted last week continues with undiminished vigor. No change in prices has occurred since our last report. Collections are good and are growing better as the season advances.

**Nails.**—Manufacturers' agents report but a light movement in Steel Nails. Discussing the effect of the Jefferson circular, quoted last week, it is claimed by Cut Nail salesmen that if it should be generally adopted by the trade a severe blow would be dealt to the Tack and Small Nail makers and the Wire Nail manufacturers. It would be necessary, in order to secure the lowest prices named, for merchants to include in their assortments three-penny Fine and other Small Nails with high extras, thus restoring a trade to Cut Nail manufacturers which has largely been lost by that interest. Jobbers' prices are as follows: Small lots of Steel Nails, \$2, and carloads, \$1.95; small lots of Wire Nails, \$2.40, and carloads, \$2.35; Wire Nails are occasionally shaded to good buyers, but Steel Nails are quite firm at quotations.

**Barb Wire.**—Manufacturers are running behind on their orders and Barb Wire is beginning to get scarce. Prices, however, are about as they were, jobbers quoting Painted at 2.75¢ @ 2.80¢ for small lots, with 60¢ @ 65¢  $\frac{3}{4}$  100 lb advance for Galvanized.

**Pig Lead.**—This market has been remarkably quiet for some time. The sales of the past week footed up about 200 tons at 3.45¢. At the close 3.40¢ was bid, and 3.45¢ asked. Consumers are still holding off expecting to buy lower, but thus far sellers have not been disposed to meet their views.

Dan P. Eells, president of the Calumet Iron and Steel Company, has resigned his position on account of the pressure of other duties, and Charles Himrod was elected to succeed him, at a meeting of the Board of Directors on the 6th inst.

August Pollak, dealer in Old Railway Material, Scrap Iron, &c., has purchased a lot 100 x 300 feet, at the junction of the Chicago and Western Indiana with the Michigan Central and Illinois Central railroads, to be used for an Iron yard. He will put in shears and all necessary fixtures for his purpose. He will retain his city office in the Exchange Building.

R. C. Hannah, secretary of the North Chicago Rolling Mill Company, returned

last week from a pleasure trip to the West Indies and the northern coast of South America.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., April 9, 1889.

**Pig Iron.**—There has been more activity during the week, but as regards prices the results have not been satisfactory. Some brands are held at firm prices, and are readily taken at full quoted rates, while others have found it necessary to shade a little in order to retain their trade. A good deal depends on the delivery. At some points Southern and Western Irons have advantages, in others they have disadvantages, so that prices have to be twisted accordingly. The net result, however, has not been in sellers' favor, although the increased demand ought to admonish consumers that there is a limit to these things, and that it cannot be far from to-day's prices. On the whole, and in spite of the unsettled condition of the market, the trade have about made up their minds that quotations will not go below what they are to-day. Sales may be made at less in exceptional cases, but it is thought that the general market will not go below \$17.50 @ \$18 for No. 1, delivered, or \$15 @ \$15.25 for Gray Forge. Certain lots, under special circumstances, may be picked up as bargains at less money, but a wholesale reduction in the output would be made rather than continue making Iron for any market which could not at least promise to-day's prices. At the moment the slightly improved demand is offset by the greater urgency to place Southern Irons. At certain points usually regarded as equivalent to Philadelphia deliveries competition is very severe. It may cost a Lehigh or Schuylkill furnace, say, 20¢ or 25¢ extra to reach a certain point near Philadelphia, while a through rate from the South may give as much of an advantage to the more distant furnace, and 40¢ @ 50¢ difference is not easily overcome in times like these. This is one of the problems which can only be solved by a readjustment of demand and supply; and time alone can accomplish that. Stocks of Iron are believed to be very moderate, so that any improvement in the demand would soon be reflected in prices. The impression is that such an event is near at hand, although in the meantime there is nothing more than general principles upon which to base such an opinion. Still, it will be contrary to all former experience if the turn does not come soon, and when many least expect it. Prices have varied greatly during the past week. Some prime brands of No. 1 Foundry command as high as \$18.50, delivered, others from \$17.50 to \$18, down to \$17 for Southern brands. Mill Irons have not varied to the same extent, \$14.75 for Southern being the lowest, up to \$15.50 for favorite Pennsylvania brands, with average qualities at about \$15. As a matter of fact, \$15.25 is the usual asking price, but several lots of good Iron have been picked up at \$15, delivered.

**Blooms.**—There is a moderately good demand for Steel Blooms, and sales continue to be made at quotations about as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33  $\frac{3}{4}$  "Bloom" ton of 2464 lb.

**Muck Bars.**—The market is not specially active, as buyers are not inclined to meet the increased demands of holders. There are plenty of bids of \$26 @ \$26.50, delivered, but \$27 @ \$27.50 is asked, with a few small sales at the inside rate.

**Bar Iron.**—There is nothing in the way of improvement to note in this department. In some cases mills are fairly employed on local orders, but the majority are running irregularly and not nearly up to their average; some, owing to labor troubles, &c., have shut down entirely. There is not much new work in sight at the moment, and from present appearances things seem likely to drift along in their present condition for some time to come. Prices are about the same as last week, say, \$1.75 @ \$1.80, nominal, but a great deal of business is taken at about \$1.70 for what is claimed to be first-class quality of Iron. Skelp is neglected, and prices entirely nominal at \$1.75 for Grooved and \$1.85 @ \$1.90 for Sheared.

**Plate and Tank Material.**—There has been more business on the market, and on the whole mills are better supplied with orders than they have been for some time past. This may not apply to every mill, as some are still short of orders; but the general position is improving, and prospects are still more favorable for the near future. Some of the largest consumers of Plates have recently taken a great deal of work, so that a continued good demand for Plates is a matter of certainty. Prices, however, are still unsatisfactory, although they are felt to be at absolutely rock bottom, with some disposition to ask a slight advance for late deliveries. Ordinary quotations are about as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.8¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3 $\frac{1}{4}$ ¢; Fire-Box, 3 $\frac{1}{4}$ ¢ @ 3 $\frac{1}{2}$ ¢.

**Structural Material.**—The mills have taken on a good deal of work recently, and in most cases they are now running full time. The outlook is considered to be decidedly favorable, as a large amount of work is in a fair way for being closed within the next few weeks. Of course there is always more or less delay in reaching a final conclusion, but that the work has to be done, and will be done soon, is a matter of certainty, so that manufacturers feel quite encouraged by the outlook. Meanwhile specifications are coming in quite freely on orders taken some time ago, so that mills are showing a considerable amount of activity. Prices remain as before, viz.: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—The demand is about fair; some mills report an active business in specialties, others say they find things very dull. Prices are steady, and in most cases about as follows for car load lots:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined No. 28.....	3.60¢
Common, $\frac{1}{4}$ ¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3 $\frac{1}{4}$ ¢
Best Soft Steel, Nos. 21 to 24.....	3 $\frac{1}{2}$ ¢
Best Soft Steel, Nos. 25 to 26.....	3 $\frac{3}{4}$ ¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, $\frac{1}{4}$ ¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67 $\frac{1}{2}$ %

**Steel Rails.**—There is but little change to report in this department. Inquiries are being made for good sized lots, but buyers are either not ready to place their orders, or are waiting to see if lower prices will be accepted. Manufacturers are very firm, however, and \$27.50 @ \$28, at mill, are inside quotations, with sales during the week all at \$28 for lots of a few hundred tons each.

**Old Rails.**—There is nothing doing in this market, so that prices are purely nominal. Buyers could be found at about \$23

for T's, f.o.b. cars here, but there are none for sale unless at \$24 and upward. Lots delivered at near-by mills command from \$23.50 to \$24 for such quantities as buyers require for immediate use.

**Scrap Iron.**—There is more inquiry for Scrap, with \$20.50 bid for cargoes, April and May shipment. Small lots sell at about the rates quoted below, viz: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is fair and prices steadier than they have been for some time past. Prospects in this department are believed to be improving. Discounts as follows: Butt-Welded Black, 55%; Lap-Welded Black, 65%; Butt-Welded Galvanized, 45%; Lap-Welded Galvanized, 55%; Boiler Tubes, 62½%.

**Nails.**—There is a better demand for Nails, and stocks are rapidly decreasing. This is due largely to a reduction in the output, which is likely to be made still more important, as the Atlantic Association is arranging for a further curtailment by its members. Prices are nominally \$1.90 @ \$2 from store, but there is great irregularity in carload lots.

The dissolution of the firm of Lindsay, Parvin & Co. is announced. The business of the old firm will be continued by James G. Lindsay & Co., at their former address. Mr. Parvin has also taken offices in the Bullitt Building, and will do a similar business under the firm name of Parvin & Co.

## St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,  
St. Louis, April 8, 1889.

**Pig Iron.**—Business during the past week has been stagnant. Agents are all complaining of the scarcity of orders, and there does not appear to be anything in the near future upon which they can base any calculation for early improvement. Large buyers seem rather chary about placing orders at present, why it is difficult to determine. Their stocks are generally reported as being light, and prices are as low as they have been for some time, and it certainly seems a favorable opportunity to purchase, as it is hardly probable that prices can go much lower, as it is pretty generally conceded that quotations ruling to-day are close to cost price, although on an order for a good-sized lot even these figures might be shaded somewhat, as furnaces prefer to sell at cost rather than stock up the Iron on the banks. We repeat quotations of last week, which in the absence of sales are to a certain extent nominal:

Southern Coke, No. 1 Foundry,	\$15.50 @	\$16.00
Southern Coke, No. 2 Foundry,	15.00 @	15.25

Charcoal Foundry, No. 2.....	16.75 @	17.50

Connellsville Coke, f.o.b. East St. Louis, \$4.70; St. Louis, \$4.85.

**Bar Iron.**—No improvement can be reported in this department as far as prices are concerned. Mills are hopeful, however, and with the renewal of railroad work, which now looks probable, anticipate some improvement over the low prices which have been ruling for the past few months. Mills are kept fairly busy,

although they claim that a number of orders have been taken on which first cost was hardly realized. We quote as follows: Lots from store \$1.80; carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb Wire.**—A large amount of Barb Wire is being sold, as is usual at this season of the year. Merchants are stocking up for spring trade, which has already commenced, and, as they anticipate a large trade, manufacturers are accordingly more sanguine as to the ultimate outcome as regards prices, and say an advance is in order, and should the present demand continue expect to see their way clear to advance prices to a point which will enable them to do business with some profit, which they claim they have not been able to do for some time. Mills quote as follows for carload lots: Two and Four Point Painted, \$2.80; Two and Four Point Galvanized, \$3.40, f.o.b. St. Louis. Less than carload lots, 5¢ additional.

## Louisville.

LOUISVILLE, KY., April 8, 1889.

**Pig Iron.**—The market has remained quiet during the past week, sales in small quantities only being reported, the demand for Strong Mill Irons being most active. The slight advance in prices which took place recently has not been followed by any further increase in the value of Iron, and some sales are reported within 75¢ a ton of the lowest price at which Iron has been sold. We quote as follows:

Southern Coke, No. 1 Foundry,	new classification.....	\$14.75 @	\$15.25
Southern Coke, No. 2 Foundry,	new classification.....	14.25 @	14.75
Southern Coke, No. 3 Foundry,	new classification.....	13.75 @	14.25
Gray Forge.....		13.25 @	13.75
White and Mottled, different grades.....		12.75 @	13.25
Silver Gray, different grades.....		13.00 @	13.50
Southern Charcoal, No. 1 Foundry		16.25 @	16.75
" " " " " " " " " " " "		14.75 @	15.25
Southern Car-Wheel, standard	brands.....	21.75 @	22.75
Southern Car-Wheel, other brands		18.00 @	19.50
Hanging Rock Coke, No. 1 Foundry.....		15.50 @	16.00
Hanging Rock Charcoal, No. 1 Foundry.....		19.50 @	21.00
Hanging Rock, Cold Blast.....		20.75 @	23.75

## Cleveland.

CLEVELAND, April 8, 1889.

**Iron Ore.**—The market is now fully opened, and substantial orders for new Ore are being placed every day. The heavy buyers at Pittsburgh and in the Mahoning and Shenango valleys are beginning to make their purchases, an indication that prices are firmly established and that lake freights have been forced down to as low a point as may be hoped for. During the past three or four days there have been sold probably 400,000 tons of new Ore. Included in this lot was about 30,000 tons of Bessemer Ore containing less than 0.02 of phosphorus, at \$6.25, f.o.b. vessels Cleveland. This is a favorite grade of Ore, and is usually expected to command 50¢ more per ton than other Bessemer. Sales aggregating 75,000 or 100,000 tons of Republic Ore have occurred at \$5.75, f.o.b. vessels Cleveland, Fairport and Ashtabula, and probably 40,000 tons of Champion Ore have been taken at the same figure. Menominee Range Ores, both Bessemer and non-Bessemer, are being sold to furnacemen in the East at \$5.10 @ \$5.20 for the former and \$4.10 @ \$4.20 for the latter, f.o.b. vessels Buffalo. It is estimated that the total amount of Ore already sold for delivery to Eastern furnacemen, who have hitherto bought foreign Ore almost exclusively, will aggregate 350,000 tons. Included in this amount is a round lot of Vermillion Ore, which will be carried from Two Harbors to Buffalo at \$1.25 per ton, and which will be delivered at Buffalo at

\$5.75, f.o.b. vessels. Inquiries are now being received for No. 1 Specular and Magnetic Ores of non-Bessemer quality at \$5, and sales will likely be made at that figure during the coming week. Gogebic Bessemer are in excellent demand at about \$5.15 @ \$5.25, f.o.b. vessels Cleveland. A considerable quantity of the best Gogebic Ores has been sold at \$5.25, a price about 20¢ or 25¢ above the opening price for the same Ores last season. The sale of about 10,000 tons of Non-Bessemer Hematites is said to have been made at \$4, the Ore to be delivered at Lake Erie ports. The vessels of the consolidated Steel companies at Chicago have already begun the work of bringing to that city the new Ore purchased three weeks ago. The first cargoes of new Ore are looked for at this port in ten days or two weeks. Less than 15,000 tons of unsold Ore remains on the docks at Lake Erie ports. Lake freights seem permanently fixed at \$1.25 from Ashland and Two Harbors; \$1.15 from Marquette and \$1 from Escanaba. Contracts for bringing Ore from Marquette to Cleveland, Lorain, Toledo, Fairport, Ashtabula and Erie from the opening of navigation until September 15 have been made at \$1.15 per ton. Quotations for new Ore have been fixed at the following figures, f.o.b. vessels, Lake Erie ports.

No. 1 Specular and Magnetic Ores,	Bessemer quality.....	\$5.75 @	\$6.00
No. 1 Specular and Magnetic Ore,	Non-Bessemer quality.....	5.00 @	5.25
Red Hematite Ores, Bessemer quality.....		5.00 @	5.25
Red Hematite Ores, Non-Bessemer quality.....		4.00 @	4.15
Menominee Range Ores, Bessemer quality.....		5.00 @	5.25
Menominee Range Ores, Non-Bessemer quality.....		4.00 @	4.10
Gogebic Range Ores, Bessemer quality.....		5.15 @	5.35

**Pig Iron.**—Transactions are still limited, and the scattering sales reported are unimportant. This lack of activity is, however, no more apparent than has been the case for the past two weeks, and sellers seem even less disposed to place their Iron upon the market at a sacrifice. The situation is not regarded as wholly discouraging, both buyers and sellers looking for better things in three or four weeks.

**Old Rails.**—There is a fairly good demand for old American Rails at \$22.75 @ \$23, and a small lot is said to have commanded the latter figure. Old Wheels at \$19 are selling quite freely.

**Nails.**—Steel Wire Nails are steady and in fair demand at \$2.35, but Steel Cut Nails have declined to \$1.90 per keg.

## Birmingham.

BIRMINGHAM, ALA., April 8, 1889.

While the bottomward tendency of prices seems still to prevail, it may be said upon the whole that there is a better feeling. Still, there seems to be some diversity of opinion as to what the outlook is. An experienced ironmaster talking to your correspondent appeared rather the reverse of hopeful, dwelling principally upon the disadvantage Southern Iron is at in remoteness from the great markets and consumption of the North. While the rates appeared reasonably low from this place to the chief Northern markets, Southern roads were not nearly able to compete with rates made for Northern furnaces. Another well-known and established manufacturer spoken to was hopeful and not at all afraid of more than transient bother by freight rates. This district especially, he held, was now so well supplied with railroads as soon to ask no favors of the great lines controlled in the North. Birmingham has railway connection with the coast east and west and with the Tennessee River on the north, and the manufacturers are now strong enough to build railroads of their own.

The market is still dull, with little offerings in expectation of better prices some time within ability to hold. The rolling mills are not sanguine, though every department of the business is busy. Foundries and shops appear to have plenty to do. No. 1 Foundry is held at from \$12.50 to \$13. Some Gray Forge sold the other day at \$11.45.

Mary Pratt Furnace, which went out of blast to enlarge from a 40-ton to a 75-ton plant, will blow in early in May.

The money situation is greatly improved over this time last year. There is a good demand, and it is going at easy rates. Bankers say business generally was never on a more solid and comfortable basis than now.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, April 8, 1889.

**Pig Iron.**—There have been but few, if any, new features developed in the local market for Pig Iron during the past week. The current business has been mainly confined to the filling of small orders for both Forge and Foundry grades, mainly the former. Buyers, as a class, are disposed to be extremely conservative, unwilling to anticipate wants, but running close to supply on hand, and this inactivity helps to produce the end they desire, with some indications of success. Sellers, however, are making little effort to sell, predicting a more confident feeling and higher prices in the fall, and expecting no decline, now that prices have about reached the productive cost price. However, a few sales made during the week indicate a lower basis, 1000 tons Mottled having been sold at \$12.25, and 1000 tons Gray Forge at \$13, cash. Smaller amounts have been sold at 25¢ above these prices. No. 1 Southern Foundry Iron has been held firmly at \$15, but buyers are unwilling to pay this rate, and at the close there is an intimation that this rate could be shaded. It is reported that some round lots have been sold recently, but particulars are wanting. The following are the approximate prices current here at the close, for cash, f.o.b.:

### Foundry.

Southern Coke, No. 1 (new classification).....	\$15.00 @ \$15.50
Southern Coke, No. 2 (new classification).....	14.50 @ 14.75
Southern Coke, No. 3 (new classification).....	13.75 @ 14.25
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

### Forge.

Strong Neutral Coke.....	13.25 @ 13.50
Mottled Neutral Coke.....	12.25 @ 12.50
Gray Forge.....	13.00 @ 13.25

### Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

**Manufactured Iron.**—There has been a light demand for almost all kinds of Manufactured Iron, both mills and foundries being lightly supplied with orders, and an easy time has prevailed.

**Nails.**—There has continued to be a moderate jobbing demand, which has been readily met at previous prices; 12d @ 40d sell at \$1.95 @ \$2 keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 keg.

**Old Material.**—There have been freer offerings of Old Rails, and only a moderate demand, at \$20 @ \$20.50, spot. Old Wheels have remained dull, and are nominally quotable \$18 @ \$18.50, spot cash.

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, April 8, 1889.

There are indications of an early improvement in the general iron trade; some large contracts for Wrought-Iron Pipe have been placed during the past week, which will to that extent stimulate the demand for Pipe Iron; and this, it is probable, will be followed by an improvement in the regular Merchant Iron trade. There is a very fair volume of business now, the complaint being chiefly in regard to prices, which are so low as to afford little or no margin for profit. While but few of the mills are running full, they are nearly all in operation, and the indications are that there will be a still better demand as the season becomes more advanced.

Mr. James Callery, president of the Pittsburgh and Western Railroad, and a well-known business man of this city, died suddenly of apoplexy on Friday last. The name of Mr. H. W. Oliver, of Oliver Bros. & Phillips, has been mentioned to succeed Mr. Callery as president of the Pittsburgh and Western Railroad. Mr. Oliver rendered valuable service to the road some years ago when it was in close quarters. The name of Mr. John W. Chalfant, of Spang, Chalfant & Co., is also mentioned in connection with the vacant presidency. The Pittsburgh and Western Railroad gives Pittsburgh an additional outlet both East and West, and is in direct communication with the Shenango and Mahoning Valley Iron districts.

**Pig Iron.**—There has been no important change in the situation during the past week; brokers continue to report business as being as dull as ever, but they are hopeful of an early change for the better. Forge Irons are 25¢ per ton lower than a week ago, while Foundry grades and Bessemer remain unchanged. Furnacemen generally are not disposed to press the market, but there are always those whose financial necessities compel them to sell at the best price they can get, as it is the only way of raising the money, which they must have. The indications are that there will be an increased consumption soon, and with a falling off in production, the outlook is favorable for a better market. Furnacemen say there is no money in the business in the present condition of affairs, and it is probable furnaces now in blast will blow out as soon as they get through with existing contracts. It is the opinion of well-informed operators that prices cannot possibly go much lower, and that with anything like an improvement in the demand the market will stiffen up again. We quote prices as follows:

Neutral Gray Forge.....	\$14.00 @ \$14.25, cash
White and Mottled.....	13.00 @ 13.75, "
All-One Mill.....	15.00 @ 15.50, "
No. 1 Foundry.....	18.50 @ 17.00, "
No. 2 Foundry.....	15.50 @ 16.00, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Cold Blast Charcoal.....	24.00 @ 27.00, "
Bessemer Iron.....	16.50 @ 16.75, "

**Manganese.**—Sales of 80 % Ferromanganese at \$59.50 @ \$60; and 20 % Spiegel at \$30 @ \$31.

**Muck Bar.**—There appears to be a little more inquiry, but prices remain unchanged; we continue to quote at \$26.50 @ \$27, cash. May or June delivery could not be bought at prices quoted, as makers generally are not disposed to sell very far ahead.

**Manufactured Iron.**—There is no change to note in the situation as regards the regular Merchant Iron trade; business continues light, while prices show no improvement, being unsatisfactory and unsettled. We continue to quote first quality Iron upon a basis of 1.70¢ @ 1.75¢ for Bars, 60 days. 2 % off for cash; Old Rail Iron can, of course, be had considerably below prices quoted. There is an improved demand for Skelp Iron, contracts

for several thousand tons having been placed during the past week upon a basis of 1.65¢ for Grooved and 1.90¢ for Sheared. The mill at Milvale, formerly owned by Graff, Bennett & Co., has been started up by a syndicate of the creditors of the firm in question, and will be run chiefly on Skelp Iron.

**Nails.**—There is no improvement to note, and not much prospect of any; the Cut Nail appears to have been pretty well supplemented by the Wire Nail. Carnegie, Phipps & Co. are increasing their capacity at their works at New Brighton, Pa., for making Wire Nails, while the Cut Nail makers, both here and at Wheeling, are doing next to nothing. We continue to quote combination rates for the latter, \$1.90 for 12d @ 40d, 60 days, 2 % off for cash.

**Wrought-Iron Pipe.**—We can report a considerably increased volume of business within the past week, orders for some 15,000 tons of Line Pipe having been placed, and what is equally as encouraging is that the prices agreed upon at New York on the 20th of last month are being faithfully maintained by makers. It looks now as if the demand for Pipe was likely to turn out a good deal better than generally expected. In addition to gas and oil fields now being opened up there will be a good deal of Pipe wanted in the older districts. We repeat former quotations. Discounts on Black Butt-Welded Pipe 55 %; on Galvanized do., 47½ %; on Black Lap-Welded, 67½ %; on Galvanized do., 55 %; Casing, all sizes, 62½ %; Boiler Pipes, 62½ %; Two-inch Tubing, 13¢ per foot, net; Line-Pipe, 8-inch, 90¢ per foot net; 6-inch, 53¢; 3-inch, 20¢.

**Old Rails.**—The market continues quiet, but few offering and not much inquiry. We continue to quote Old Iron Rails at \$23 for American Tees and Old Steel at \$19 for long and \$17.50 @ \$18 for short lengths.

**Steel Rails.**—Heavy sections are still quoted at \$28, cash at mill, for small lots. A large order, it is intimated, would be accepted considerably below price quoted. The new mill of the Allegheny Bessemer Company, recently started, is reported as doing excellent work.

**Billets, Blooms, &c.**—Bessemer Steel Billets and Blooms are still quoted at \$27 @ \$27.50, cash. Nail Slabs, while quoted higher, it is stated can be had at \$29, and there is very little demand for them. Domestic Bloom and Rail Ends, \$17.50 @ \$18.

**Railway Track Supplies.**—Prices remained unchanged. Spikes, 2¢, 30 days; Splice Bars, 1.75¢ @ 1.80¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

**Old Material.**—Demand continues light, while prices remain unchanged. No. 1 Wrought Scrap, \$19 @ \$19.50, net ton; Wrought Turnings, \$13 @ \$13.50; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14.50 @ \$15, gross; Cast Borings, \$11 @ \$12; Car-Wheels, \$19.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, April 8, 1889.

**Pig Iron.**—Is moving off about as fast as made, and there is only a slight falling off in the prices that are being realized. The character of the trade is somewhat different to what it was a few months ago. In this respect, instead of large round lots being sold for deliveries in the long future, the demand seems to be for smaller lots and for immediate shipments, and the Southern Irons are now being so shipped to nearly every local consuming point through the North and West. The rates of freight that have been published from time to time in the columns of *The Iron*

Age have afforded small consumers facilities for ordering direct from the furnaces, and they have in a great many instances availed themselves of it. The fact is that many Northern and Western consumers are now looking to the Southern Iron districts for their main supply, and are gradually being weaned from Irons made North, and during the last two or three months many of the Eastern founders are assuming this position in their purchases. There are a few of our Southern stacks that are turning out a quality of Foundry Iron that seems to be a greater favorite with many consumers than any of the Irons made in the North, and as it can generally be bought from 50¢ to \$1 per ton cheaper than the Northern Iron, it is, of course, purchased in preference. A question of great interest with all our Southern manufacturers is the entire sympathy that is being manifested by all the railroad lines with them, and there is hardly an instance but what producers receive on application a rate but what is entirely satisfactory to any point named, be it East, West, North or South, where they find a market for their goods. Notwithstanding many of these rates in some instances may be considered low, to such an extent is the increased incidental and necessary freight and travel that is being attracted over the lines by reason of these increased industries that there is not a line South but whose net earnings grew or increased each month from 25 to 50 % more this year than they were last.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, April 10, 1889.

**American Pig.**—Some of the leading makers and agents report an increased business, but other sellers still report the market very dull. Northern standard Irons can be readily bought at \$17.50 @ \$18, and some Southern Foundry Iron is offered under \$17 for No. 1. It is true that some of the Iron thus offered is a new brand, but that does not materially alter the situation, since when one brand of Southern Pig is introduced another comes up. The sharpest competition is at New England points, some of which can be reached by Southern makers within 25¢ of the cost of putting the Iron into New York harbor. We quote Northern standard brands, tidewater delivery, \$17.50 @ \$18 for No. 1 Foundry; \$16.25 @ \$17 for No. Foundry, and \$15 @ \$15.25 for Gray Forge.

**Structural Iron and Steel.**—We quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

**Bar Iron.**—We quote: Carload lots on dock, half extras, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Re-fined, 1.7¢ @ 2¢.

**Steel Rails.**—The market is very quiet, and only minor sales have been made by Eastern mills during the past week, with comparatively little business pending and prices unchanged at \$27 @ \$27.50 for large lots. In the West a sale is reported of 10,000 tons delivered at Toledo, Ohio, 4000 tons going to Chicago mills and 6000 tons to the new Pittsburgh mill.

**Scrap Iron.**—The market for Scrap is inactive, some business in a small way being done at about the following prices: No. 1 Scrap, \$20 @ \$21, for carload lots, delivered; Turnings, \$13 @ \$14, for cargo lots, do.; Cast Scrap, \$15.50 @ \$16, do., and Horseshoes, \$23 @ \$23.50.

**Wire Rods.**—Only small sales of For-

eign Rods are recorded, among them the Acid Rods alluded to in former issues. We continue to quote \$41.25 @ \$41.50 for Foreign.

**Old Rails.**—The market is very quiet, with little offering, and a very light demand. Any effort to sell would result in a lowering of values, \$22.50 being the best bid obtainable for large lots. It is stated that there are 6000 tons of Old Rails waiting for a market, in the Southwest, 4000 tons in Pittsburgh, 2500 tons in Maryland and 2500 in New Jersey.

## Financial.

Accounts respecting the general business situation are somewhat conflicting, it being too frequently necessary to make abatements, whatever view is taken of the general outlook. The volume of trade is restricted in several directions and the margin of profit is satisfactory only in occasional instances. Collections, too, are inclined to drag, and as regards most of the heavy commodities business is being done on a falling market. In wheat there was a break on Monday, both in New York and Chicago, with free sellers and little support, but exporters remained quiet. Provisions are weak and lower. With dry-goods jobbers the busy season is over. Coffee is steady; sugars are firm, but business is hardly as active. The purchase in San Francisco of the American Sugar Refinery by Havemeyers & Elder is a strong addition to the power of the Sugar Trust on the Pacific Coast. The American Refinery has a capacity of 250,000 pounds daily. The east-bound movement from Chicago by rail shows a heavy falling off, largely due to the opening of the water routes. The main line on the Welland Canal opened 16th inst. Cheerful accounts are received of the progress of wheat seeding in the West. In Southern Minnesota and Southern Dakota about 30 per cent. of the wheat is in the ground. Winter wheat has been vastly improved by recent rains.

The Stock Exchange market was more active and strong until Monday, with prices higher for a few leading properties and some improvement in the general list. Burlington and Quincy was bought on the announcement that it is to have a representation in the Atchison's new directory. The Gould specialties were all pretty firm. St. Paul was especially affected by the confirmation of the report that the net earnings for the first quarter of the current year showed an increase of over \$1,000,000. The bank statement caused a partial reaction. On Monday stocks were influenced by a weaker tone in London, and there was some selling of Missouri Pacific and of New England. There was also a sharp bear attack, but news of the offering of nearly \$3,000,000 bonds at prices within the Treasury limit encouraged renewed buying. On Tuesday the market was feverish and lower in the early trade, with Atchison, Topeka and Santa Fe weakest, but it was steady in the afternoon, gradually growing stronger, and closed generally firm. Referring to operations upon the London Stock Exchange last week, the cable says: "Buying was largely promoted by the formation of investment trust companies, the public zeal for which is rapidly reaching a mania. The total number of trusts formed in 1888 was 15, with a capital of £9,500,000. Already this year 19 have been floated, with a capital of £25,075,000, and more are announced.

United States bonds were quoted as follows:

U. S. 4s, 1891, registered.....	108
U. S. 4s, 1891, coupon.....	108
U. S. 4s, 1897, registered.....	128½
U. S. 4s, 1897, coupon.....	128½
U. S. currency 6s.....	120

Sterling exchange is firm, but dull, with rates at \$4.87½ @ \$4.89½, near to the gold exporting point. Money is easier in Lon-

don, with a prospect that the Bank of England rate will be reduced to-day. A special Paris Cable to J. & W. Seligman & Co. says that the financial atmosphere has cleared up. Money is offered in abundance at low rates.

Richard Croker was appointed Chamberlain of the city of New York.

The city of New York is in the market for a 40 years' loan of \$9,000,000 with which to pay for parks recently acquired in the new district, offering 2½ % per annum. The Secretary of the Treasury made a new departure on Saturday by buying a large quantity of 4 % bonds at 129. The Secretary will continue to give preference in his purchases to 4½ % bonds, although at the same time he will not pay more than 108 for them. The depositary balance, for which the Treasury holds bonds as security, is now being reduced only at the rate of about \$1,000,000 per month. One year ago the denotaries held \$62,000,000 of public money. In March it was reduced below \$48,000,000. Official calculations of the money circulation of the United States show the amount of outstanding currency to be greater now by \$37,000,000 than one year ago, and greater by about \$85,000,000 than two years ago, the total being \$1,406,481,000.

Contending in favor of an anti-discrimination bill now before the Pennsylvania Legislature, Andrew Carnegie, in an address before that body on Monday evening, denounced the Pennsylvania Railroad Company in unsparing terms, that corporation having "stabbed secretly from behind and in the dark" the South Pennsylvania scheme, regardless of courts and the State constitution.

The weekly bank statement showed a heavy decrease in reserve equal to \$5,040,550, so that the surplus now held is only \$1,407,185. In loans there was a contraction of \$1,200,300. Specie decreased \$3,115,400, and legal tenders decreased \$2,591,100. Deposits decreased \$7,095,800, and circulation increased \$16,800. The position of the banks was regarded as much stronger than the statement would indicate. Money grew more plentiful as the April dividends came out, and the rate of interest soon dropped as low as 2½ % on call. Time loans are easier for 30 days at 3½ %, and the rate for 60 days to four months is 3½ and 4, and round amounts of German money are offered for long-time contracts. Commercial paper is in good demand from out-of-town buyers.

The clearings of the 41 cities last week show an increase of 5.8 % as compared with 1888. New York gained 3.8 %; Boston 7.2, Chicago 10, Philadelphia 16.1, St. Louis 8.2, San Francisco 13.2, Louisville 21.2, Detroit 33.9, Milwaukee 19.5, Cincinnati 13.7, Cleveland 13.5, Minneapolis 11.9, Omaha 25.7, Denver 21.3, Memphis 34.6, Columbus 31, Peoria 11.2. Pittsburgh decreased 0.9.

The Fifth Avenue Bank has bought of the Cornell estate the property on the corner of Forty-fourth street and Fifth avenue for about \$230,000, and the Clinton Bank has removed into its new quarters in the Mercantile Exchange building, Hudson street.

James Brown, formerly head of the banking firm of Brown Brothers, died on Friday at the Murray Hill Hotel, after a brief illness. Mr. Brown was born at Edinburgh, Scotland, in 1818.

The business failures for the quarter just ended are much larger in number than those during the same period last year, 3569, against 3053. The liabilities did not increase in proportion with the number of failures, and the assets are about 50 % of liabilities. During the last few weeks the number of failures has fallen off as compared with a year ago, but comprises several where heavy amounts are involved.

The exports of specie from this port during the week were \$607,600, and the imports \$68,000. Since January 1 the exports amount to \$12,071,000, against \$7,464,000 for the same time last year.

The imports of merchandise at this port during the week were valued at \$11,689,500, and since January 1 the aggregate is \$142,609,000, as compared with \$135,615,500 for the corresponding period last year. Exports for the week were \$7,585,000, making the total since January 1 \$96,221,000, against \$80,094,000 for the same time last year.

## Metal Market.

**Copper.**—Copper gave way in the London market during the week from £40. 10/, Chili Bars, spot, to £39. 15/ yesterday, and futures from £40. 5/ to £39. 10/, with sales of 2800 tons all told. The representatives of our mines are in Paris, and still negotiating with parties interested there. These negotiations may not be brought to a close for another fortnight, when the outstanding bankers' credits expire, and in the meantime the market here will be kept in abeyance till a price can be fixed on Lake Copper to the current consumer. Small lots of Lake have been offered at 15¢ and 15½¢, respectively, for Cokes and Ingots, without finding prompt takers, and Casting brands are sold at 14¢ and under. The Boston Transcript prints a comparative analysis of the annual reports of the five dividend-paying Copper mining companies which report for the year 1888. Quincy doubled its dividends in 1888, paying \$10 ¢ share, against \$5 in 1887; Atlantic paid \$3.50, against \$1.50; Central \$3.50, against \$2; Osceola, \$3, against \$1, and Franklin \$4, against \$1, the total amount disbursed by the five being \$920,000, against \$390,000, an increase of \$530,000, or 135%. Quincy, Franklin and Osceola called slightly on their accrued surplus in order to make these great increases in dividends. The aggregate net surplus of the five companies, after the payment of January or February dividends this year, amounts to \$1,254,852, which is \$33,512 less than at this time last year. It thus seems that the Copper companies made hay while the sun shone in the matter of dividends, the French syndicate enabling them to earn nearly 100 per cent. more on their respective stocks, and to pay 135 per cent. more in 1888 than in 1887. The average price which these companies received for their Copper in 1888 was 15 2-10 cents per pound, against 11 9-10 cents in 1887. During the first eight months of the current fiscal year the domestic export of Ingot Copper amounted to 12,954,461 pounds, against 15,029,917 in 1888.

**Tin.**—A decline took place in the London market since we last reported in spot Tin, from £94. 15/ to £93 yesterday, and in futures from £95. 12/6 to £93. 15/; sales, 1500 tons. The sales effected here during the interval were 20 tons May at 21.25¢ @ 21.30¢; 35 July and 25 August at 21¢, and 25 tons September at 21¢. Outside of the Exchange several hundred tons, in the aggregate, were sold, chiefly to jobbers, at private terms. As per cablegram from Gilfillan, Wood & Co., Singapore, to Mr. Chas. Nordhaus, their agent, 89 Water street, New York, the Straits Settlements shipped this way during the first quarter 1900 tons, against 650 last year, and to England 4850 tons, against 7800. During the first eight months of the current fiscal year the import of Tin into this country reached 22,540,666 pounds, against 19,475,161 in 1888. Straits Tin on the spot closes at 21¢. **Tin Plates.**—At the higher prices ruling, which we reported in our last report, the market has been only moderately active. Import of Tin Plates into the United States

first eight months of fiscal year, 455,044,549 pounds, against 399,225,046 in 1888. February export from England, 33,971 tons, against 28,713 and 23,656 in 1888 and 1887; first two months, 71,749, against 54,910 and 43,966 tons. We quote, large lines, ordinary brands, ¢ box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.75; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.30 @ \$4.40, and Wasters \$4.15 @ \$4.20.

**Lead.**—Sales for the week were restricted to 200 tons Common Domestic at 3.67½¢. The market has relaxed into a dull mood since at 3.65¢ @ 3.70¢. At St. Louis there has been a quiet state of affairs at 3.40¢ @ 3.42½¢.

**Spelter.**—There has been more doing on the spot at 4.65¢. Common Domestic closes at 4.65¢ @ 4.70¢, and Silesian at 5.50¢ @ 5.62½¢.

**Antimony.**—A moderate jobbing demand has prevailed at 12½¢ Hallett, and 13½¢ Cookson.

## New York Metal Exchange.

The following sales are reported:

FRIDAY, April 5.	
35 tons Tin, July	21.00¢
25 tons Tin, August	21.00¢
48 tons Lead, June	3.72½¢
32 tons Lead, May	3.72½¢
SATURDAY, April 6.	
32 tons Lead, July	3.75¢
MONDAY, April 8.	
16 tons Lead, spot	3.67½¢
TUESDAY, April 9.	
16 tons Lead, spot	3.67½¢
25 tons Tin, September	21.00¢
WEDNESDAY, April 10.	
65 tons Lead, May	3.67½¢
49 tons Lead, August	3.75¢

## Coal Market.

The Anthracite Coal market continues in the congested state noticed for some time past, the simple fact being that supplies of Coal are excessive, and despite the efforts to restrict production accumulation goes on at interior points and at tidewater. The principal Coal centers on the lakes are all overstocked. A winter of extraordinary mildness is mainly accountable for the disproportion between supply and demand and consequent derangement of plans for regulating the trade. Under conditions so abnormal prices are not easily maintained. Companies quote only the regular schedule, accepted by common consent. Nevertheless, reports are current of sales at a concession, for which individual operators are supposed to be responsible, but the aggregate of business doing is unsatisfactory, and to say that "the market is dull" fails to describe the real situation. The representatives of the Anthracite carrying corporations in this city last week reduced tolls 10¢ ¢ ton to tidewater and 25¢ to Buffalo on prepared sizes of Schuylkill and Lehigh Coal, 15¢ on Wyoming to tidewater, and 20¢ on Buckwheat to tidewater, from all three regions, to take effect on April 15. The rate on Pea Coal remains unchanged.

Coal freight agents of several Anthracite-carrying roads met on Monday at Bethlehem, Pa., and reduced the tolls on Anthracite Coal as follows: From the Wyoming region to New York, 15¢ ¢ ton on Prepared; 5¢ on Pea and 20¢ on Buckwheat. From the Lehigh region, 10¢ on prepared and 20¢ on Buckwheat to Philadelphia and New York; 25¢ to Buffalo bridges and corresponding reductions to Lake Ontario ports. To Chicago the rate is reduced 50¢ ¢ ton, to take effect April 15.

Quotations for Anthracite Free-Burning, f.o.b., are: Broken, \$3.75; Egg, \$3.90; Stove, \$4.15; Chestnut, \$4. Reading Hard White Ash prices are the same excepting Broken, which is \$3.90, and Egg, \$4. Pea is \$2.30 @ \$2.40; Lump and Steam-

boat, \$4.25. Individual sales are reported as low as 25¢ off for Egg and Broken, and about 35¢ for Stove.

Production for the week was 488,649 tons, an increase of 7000 tons compared with the previous week. Since January 1 the aggregate is 7,378,180 tons, a decrease of 79,000 tons compared with 1888.

Bituminous Coal is quiet and low prices are reported. Philadelphia was surprised by a reduction of 10¢ ¢ ton by the Baltimore and Ohio Railroad, which puts Cumberland Coal at a lower rate than the Clearfield and Beech Creek shipments; Coal was sold as low as \$2.60 alongside. This had a weakening effect on Anthracite steam sizes. Another reduction in the price of Coke has been reported. Furnace Coke has been sold at \$1.10 at some of the ovens, and even at a lower figure.

The Western Anthracite Association have made a reduction of 50¢ ¢ ton for Coal on the docks at Buffalo.

The work of building the Monongahela River Railroad will soon commence, and it is reported that this line, fed by other Coal and Coke lines, will be brought into direct connection with the Baltimore and Ohio line, opening a Coal region as large as the combined Pittsburgh-Connellsville Coal fields.

It is reported that the Lehigh Valley Coal Company will lease the Hillman and Warrior Run Collieries, which together have an annual output of 160,000 tons.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, April 10, 1889.

Prices for Copper have fluctuated during the week according to the character of various reports and rumors circulated with regard to alleged doings of the French banking institutions and mining delegates. Nothing is officially announced or definitely known as to what has actually been accomplished, but it is believed that it has been agreed to restrict the output of the pool. Consumers treat the syndicate like any other seller, and manifest a determination to buy only in a hand-to-mouth way so long as prices are held up by artificial means. Early in the week cash warrants were scarce and the price advanced to £42. 10/. Since then the tendency has been downward, and G.M.B. sold at £39. 10/ yesterday and even a trifle lower.

Shipments and deliveries of Block Tin have been large. Better news from Paris regarding negotiations on matters connected with the Copper situation stimulated speculation and led to an advance to £95. 2/6 early in the week. Since then the effect of the heavy movement has been more pronounced, and prices receded to £92. 10/ for spot and £98 for futures.

In Tin Plate buying has revived and inquiries are more numerous than last week. Prices are showing greater firmness. A large business is looked for at the quarterly meeting on Thursday. The exports last month were 31,000 tons, against 25,000 tons during March, 1888.

Pig Iron warrants declined somewhat under the effect of realizations but subsequently reacted owing to continued active demand for makers' brands and renewed purchases by outsiders. Shipments continue enormous, except to the United States, to which country only 12,400 tons (all descriptions) were exported last month. A further advance is quoted on some brands of Scotch Pigs and on Hematites. The demand for the latter continues exceedingly brisk.

Manufactured Iron has continued active in all districts and prices are strong. Scotch makers have advanced their prices about 5/, and a similar rise is quoted on Staffordshire common bars.

Steel Rails are up 5/ and strong at the advance, with the demand active. Billets and Plates are also in free demand and held higher. There is not much doing in Wire Rods or Slabs, but makers are asking 1/3 @ 2/6 advance.

Old Material is held higher, owing to the strength of the general Iron market, but business does not increase. America is offering no inducement to ship there and Italy is holding off.

Scotch Pig.—Though not as lively as last week, business has been brisk, and prices are strong, with a further advance on some brands.

No. 1 Coltness, f.o.b. Glasgow	56/6
No. 1 Summerlee, " "	56/
No. 1 Gartsherrie, " "	53/
No. 1 Langloan, " "	56/
No. 1 Carnbroe, " "	47/8
No. 1 Shotts, " at Leith	53/6
No. 1 Glengarnock, " Ardrossan	52/8
No. 1 Dalmeilington, " "	46/6
No. 1 Eglinton, " "	45/6
Steamer freights, Glasgow to New York, 3/ @ 5/; Liverpool to New York, 10/.	

**Cleveland Pig.**—The market less active, but prices held very firmly. No. 3 Middlesboro', G. M. B., 39/ prompt.

**Bessemer Pig.**—There has been a large business, and prices are strong at the further advance. West Coast brands, mixed numbers, 50/6, f.o.b. shipping point.

**Spiegeleisen.**—The demand continues fair, and prices are firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

**Steel Rails.**—Makers have advanced prices 5/, and the market continues active. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—A moderate trade passing at former prices. We quote £3. 19/3 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—The market firm and demand fairly active. Bessemer, 2½ x 2½ inch, £4. 6/3, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—A moderate business doing at firm prices. Bessemer, £3. 19/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—Holders are very firm, but the demand is moderate. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap Iron.**—There is little doing and prices are unchanged. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—Prices very firm, but dealings moderate. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin Plate.**—There has been more business and the market is firm. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/9
IC Bessemer Steel, Coke finish	13/6 @ 14/
IC Siemens	14/ @ 14/6
IC Coke, B. V. grade	13/3 @ 13/6
Charcoal Terne, Dean grade	12/6 @ 13/

**Manufactured Iron.**—A fairly active business and the market strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
Common	£ s. d. @ 5 15 0
Staff. Bl'k Sheet, singles	7 12 6 @
Welsh Bars (f.o.b. Wales)	5 2 6 @ 5 5 0

**Copper.**—Moderate purchases only by consumers. Speculation moderately active. The quoted prices were: Bars, £39. 10/ @ £39. 15/ for spot; £39. 7/6 @ £39. 10/ for three months' futures. Best Selected, £47.

**Tin.**—There has been a fairly active trade at rather lower prices. Straits quoted at £92. 15/ @ £93, spot, and £93. 10/ @ £93. 15/ for three months' futures.

**Lead.**—More doing in this line and price firmer. Quoted at £12. 10/ for Soft Spanish.

**Spelter.**—Holders are firmer, but the demand is moderate. Quoted at £17 for ordinary Silesian.

## Foreign Markets.

### EQUIVALENTS.

Franc, Peseta or Lira	19.3
Florin (Netherlands)	10.2
Florin (Austria)	35.9
Wirels (Portugal)	1.08
Wirels (Brazil)	54.6
Mark (Germany)	23.8
Kilogram	2.205
Picul	134

### CHILL.

VALPARAISO, February 1, 1889.—Copper.—After buying 14,843 quintals at \$23.80 @ \$25.90, exporters withdrew from the market altogether pending further developments in Europe. The price of \$24.50 equals £71. 3/ f.o.b., with 35/ steam freight. Coal.—Owing to scarcity English Coal commands 28/ spot, and affords 41/8. Shipments from Australia are liberal, and this sort sells at 30/ @ 31/6. Exchange, 90 days' sight, 29¼d.—Weber & Co.

### EAST INDIES.

PENANG, February 20, 1889.—Tin.—Receipts amounted during the fortnight to 10,500 piculs. Europeans bought 5640, and Chinese 6500. The market meanwhile gave way from \$36.80 to \$36.10 picul. The stock left is held by speculators.—Schmidt, Kustermann & Co.

SINGAPORE, April 4, 1889.—Tin.—There were shipped from the Straits Settlements to the United States during March 550 tons, against 250 in 1888, and to England 900, against 1800; since January 1 to the former respectively 1960, against 650, and to the latter 4850, against 7800.—Gillman, Wood & Co., per cable to Mr. Charles Nordhaus, their agent, 88 Water street, New York.

COLOMBO, CEYLON, February 28, 1889.—Plumbago.—But a moderate amount of activity has prevailed at following rates, in rupees, per ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Export, since October 1, to England, 54,901 cwt.; to Hamburg, 4419; to Antwerp, 3086, and to Bremen, 659; to Holland, 437; to India, 63; to Australia, 88, and to the United States, 58,580, together 122,233, against 111,486 in 1888; 99,235 in 1887, and 81,546 in 1886. Coir Yarn has been steady at 7 @ 12 rupees per cwt., Nos. 1 to 4. Nothing doing in Ebony. Exchange, 6 months' sight, 1/5.—Volkart Brothers to their agent, Mr. John W. Greene, 82 Wall street, New York.

MANILA, April 1, 1889.—Hemp.—May be quoted nominally \$15.50 per picul, against \$8.37½ same date last year, equaling ½ ton, cost and freight, £52, against £30. 8/6. There cleared for the United States since last cable 8000 Bales, against 4000; since January 1 90,000, against 43,000; loading for ditto 14,000, against 15,000; cleared for England since January 1 67,000 Bales, against 104,000; loading for ditto 15,000, against 4000; cleared for all other ports 9000, against 19,000; receipts at all ports since last cable 15,000, against 16,000, and since January 1, 175,000 Bales, against 152,000 last year and 115,000 in 1887. Freight \$7.50, against \$5. Exchange, six months' sight, 3/7¼, against 3/8¼.—Ker & Co., per cable direct to their agent in New York, Mr. Chas. Nordhaus, 88 Water street.

## Recent Tests of Tobin Bronze.

Since our earliest reference to the mechanical properties of Tobin bronze, manufactured by the Ansonia Brass and Copper Company, a number of additional tests have been made, which possess considerable interest. N. O. Olsen, engineer of the Fairbanks department of tests and experiments, reports the following results on 8-inch rounds, varying in diameter from 0.632 to 0.645 inch:

Mark.	Elongation, per cent.	Reduction of area, per cent.	Elastic limit, lbs. per sq. in.	Tensile strength, lbs. per sq. in.
A.....	14.50	34.05	.....	79,200
B.....	12.50	30.57	.....	80,420
C.....	16.25	33.12	.....	79,750
1.....	17.00	35.47	51,990	79,700
2.....	16.25	38.70	55,790	79,690
3.....	14.00	37.61	55,050	78,900

With a view to determining its torsional endurance for steam launch and yacht shafting, test specimens were cut at random from 4-inch hot rolled Tobin bronze rods in stock, and subjected to a torsional test in comparison with the best quality of machinery steel selected by Prof. J. E. Denton, of the Stevens Institute, and tested by him on Thurston's machine. The tensile strength of the steel was 94,550 pounds, and its stretch 36.44 per cent. in 4½ inches length of specimen, having a diameter of ¾ of an inch.

Material.	Diameter.	Load at end of one foot lever.	Twisting in degrees.
		Which strained samples to elastic limit, lbs.	Which ruptured samples, lbs.
		At elastic limit.	At point of rupture.
Tobin bronze.	.500	325	660
	.498	340	625
	.498	320	615
Machinery steel.	.497	330	710
	.498	350	700
	.498	340	725
Average for bronze.		328	633
Average for steel.		340	711

The length of all the specimens was 1 inch.

T. William Harris & Co., No. 44 Broadway, New York, have been awarded the contract for building water-works for the town of Marblehead, Mass. The work includes about 8 miles of pipe and a great deal of difficult ledgework, as the streets are very narrow and the ledge plentiful and hard.

Warren T. Kellogg, of Lansingburg, who was for ten years manager of the Cohoes Iron Foundry and Machine Shop, in Cohoes, has purchased the plant known as the scale property in Lansingburg. This plant was until recently occupied by the Rensselaer Scale Works, now located on Cohoes Island, near the Cohoes and Lansingburg bridge. Mr. Kellogg proposes to use the plant in the manufacture of the Empire portable forges. The work of the Empire Portable Forge Company is now done by contract, some in Cohoes and some in Philadelphia. Mr. Kellogg proposes to unite all these branches of manufacture in the Lansingburg plant as soon as the expiration of existing contracts will permit.

## Hardware.

There is a good deal of complaint in this market in regard to business, the demand at the present time not coming up to expectations and trade being characterized by more or less sluggishness. In a good many lines, especially seasonable goods, there is fair activity, and in some the manufacturers have difficulty in filling orders promptly. The general tone of the market in regard to prices is without important change, and there are remarkably few lines of goods on which revised quotations are issued. Prices, as a rule, are not especially strong, but the close margins on most lines prevent concessions. Collections are rather slow.

### Barb Wire.

In the territory covered by the Eastern manufacturers there is a very satisfactory business doing, and the demand is referred to as in excess of last season's. Prices also are well maintained on a basis of 3.5 cents for carload lots of Galvanized Four-Point, 3.6 cents for 3-ton lots, and 3.8 cents for smaller parcels, with deliveries.

### Cut Nails.

The volume of business in the New York market is now satisfactory, and there is not so much eagerness to sell, the market remaining at \$1.80 for carload lots of Iron Nails, on dock. The pool plan of the Eastern manufacturers is going the rounds for signatures by those who did not attend the Philadelphia meeting.

### Miscellaneous Prices.

Shepard Hardware Company, Buffalo, N. Y., quote their Lightning Freezers and their Giant Lightning Freezers at a discount ranging from 65 per cent. to 65 and 5 per cent.:

#### Lightning Ice-Cream Freezer.

2-quart.....	\$3.75
3-quart.....	4.50
4-quart.....	5.50
6-quart.....	7.00
8-quart.....	9.00
10-quart.....	11.00
14-quart.....	14.00

#### Giant Lightning Ice-Cream Freezer.

14-quart, with clutch and fly-wheel.....	\$30.00
20-quart, with clutch and crank.....	28.00
20-quart, with clutch and fly-wheel.....	28.00

White Mountain Freezer Company, Nashua, N. H., are quoting on their White Mountain Freezers discount 50, 20 and 5 per cent., and on their New Arctic Freezers discount 50, 40 and 5 per cent. The latter Freezer, which has been put on the market this season, is referred to as having been in so much demand that the company have found it difficult to execute orders as promptly as they could wish, but they are rapidly working into better shape, and state that from this time on they will probably be able to fill orders on receipt. Since last season they have increased their facilities by the addition to their plant of a three-story brick building 170 x 36 feet, but still find themselves somewhat cramped for room. They state that they are employing upward of 280 men, and in many departments running extra time, their average monthly production being about 15,000 Freezers.

Goshen Sweeper and Wringer Company, Goshen, Ind., issue circulars describing the Hoozier and the Leader Broadcast Hand Seed Sowers, for which they have an extensive trade in this country and also export large quantities. They are sold at the following prices:

The Hoozier Broadcast Hand Seed Sower, per dozen.....	\$24.00
The Leader Broadcast Hand Seed Sower, per dozen.....	20.00

The Wringer market, besides the animated competition which prevails and the fair business that is doing, has few fea-

tures that call for mention. The prices which are prevailing are regarded as very low and as not justifying concessions beyond the regular quotations without some sacrifice of the quality. The stock of Wringers in the hands of the trade recently purchased at low figures is regarded as considerable.

The manufacturers of Freezers agree in reporting a very satisfactory business, the demand having been in some cases in excess of last year. Prices are, however, slightly lower than those which ruled the past season.

### Items.

Samuel F. Randolph, who has been connected with the firm of J. C. McCarty & Co. and their predecessors for more than 20 years, has resigned his position with them as manager of their financial department, to accept the management of the Commonwealth Rubber Company, of 25 Murray street, New York, a manufacturing corporation just formed. Mr. Randolph takes with him the hearty good wishes of all his friends and associates in the trade for the success of the new company. The officers of the company are: Lewis Roberts, president; S. F. Randolph, treasurer and manager; Addison F. Roberts, secretary.

The firm of Dickinson, Pulliam & Co., of Little Rock, Ark., established in 1879, have been incorporated under the laws of their State as the Dickinson Hardware Company, with a capital of \$50,000, all of which has been subscribed and paid in, and is held by the following parties: W. W. Dickinson, president; Thos. J. Darragh, vice-president, and Jacob Niemeyer, secretary and treasurer. They propose to do a jobbing Hardware and Stove business, and will also work the Machinery business thoroughly. They desire to make connection with some of the leading manufacturers of Saw Mills, Engines, Corn Mills and other lines, and would be glad to have correspondence as to prices, terms, &c.

Among the special notices on page 45 is one in which the Roanoke Mfg. and Investment Company, Roanoke, Va., call attention to the desirability of that point for the establishment of manufactories and the inducements which are offered. We are advised that the company propose to offer to concerns who with good faith and some means locate in that city and engage in the manufacture of staple and marketable goods, privilege and use of an agreed amount of the capital stock of the company, and to make other arrangements presenting financial inducements. The city, we are advised, has grown from 400 inhabitants in 1880 to 15,000 in 1888, and has already a number of manufacturing concerns, including a rolling mill, blast furnace, machine works, planing mills and other factories, a bridge construction and ironworks plant being in course of erection.

Gooch Freezer Company, Cincinnati, Ohio, are this season placing on the market, besides their well-known Peerless and Giant Freezers, the Zero, Pet and Boss Freezers, which are made to supply the demand for cheaper goods.

The Deverall Perfection Mfg. Company, 1 Adams street, Brooklyn, N. Y., illustrate in a leaflet circular their line of Locomotive, Cotton Mill, Bench and other Oilers and Hand Lamps, which, they advise us, they are now making in an improved form, and are in a position to fill orders promptly.

George Chase, 107th street and First avenue, New York, has issued a price list of Arkansas, Washita and other Oil Stones, of which he is manufacturer. Special attention is called to the Green Paper brand

of Washita Stone. It is described as carefully selected with reference to its cutting qualities and as being superior to the ordinary No. 1 Stone, being softer, of more even grain and not liable to glaze with proper usage. His mounted Oil Stones for carving tools and German Razor Hone are also illustrated. Mr. Chase reports that his business has never been better than at present, and refers especially to the activity in export trade.

Palmer Mfg. Company, 290 Pearl street, New York, issue a sheet showing their line of fancy metal goods in brass, copper, white embossed metal, &c. An interesting variety of Trays, Crumb Trays with Brush and Scraper, Match Safes, Tea Kettles, Flue Stops, is thus shown.

In their advertisement on page 64 Sidney Shepard & Co., Buffalo, N. Y., and C. Sidney Shepard & Co., Chicago, Ill., illustrate the Shaker Flour Sifter, which is made under Barler's patent. The special feature of this Sifter is emphasized, namely, that it is operated by one hand.

William Richards, New Harmony, Ind., issues a convenient catalogue of Farm Machinery, Engines, Thrashers, Hullers, Implements and Supplies handled by him. Serviceable information is given in regard to the different machines.

In their advertisement on page 73 Thomas Devlin & Co., Philadelphia, Pa., call attention to the line of Tackle Blocks, Oar Locks, Awning Fittings and other manufactures of their National Hardware and Malleable Iron Works. They also allude to their facilities for furnishing Malleable and Soft Gray Iron and Steel Castings to order.

Markley, Alling & Co., Chicago, Ill., have issued a price current of 32 pages, representing selections of Builders' Hardware, and showing an extensive line of bronze-plated goods.

Wheeler, Madden & Clemson Mfg. Company, Middletown, Conn., have been shut down since the middle of February last, owing to a strike on the part of about one-fourth of their hands. These men were employed in such departments of their works that the company thought it advisable to close down their entire plant. Their Saw factory was, however, put in operation again on the 8th inst., manufacturing being resumed in nearly all departments, and the company are now prepared to fill orders for Hand and Crosscut Saws and kindred goods the same as heretofore. They took advantage of the shut-down to construct and put in operation considerable new machinery, which they refer to as enabling them to greatly improve the quality of their goods, while also giving them increased facilities for their manufacture. The trade will note with satisfaction this resumption of activity on the part of this leading house.

The trade will note with interest the fact that R. H. Dana & Co., 25 Beaver street, New York, have been appointed selling agents for the Douglas Axe Mfg. Company, Boston, Mass., and orders and communications relating to business are referred to them. For some time they have been representing the goods for export, but this arrangement, we understand, gives them the sale of the goods for the home trade also.

An arrangement has been completed by the Nes Chain Mfg. Company, York, Pa., by which Henry Keidel & Co., Baltimore, Md., are appointed their representatives to the Southern trade. In view of the frequent complaints about delay in filling orders the company intend making a special effort to avoid such complaints by manufacturing and storing leading sizes of Chains between the seasons, thus avoiding the subsequent overcrowding of their

order books. They advise us also that as a guarantee of quality they will stamp in bold and legible characters NBS on the ring or hook of the Chains they send out.

In their advertisement on page 63 the Simonds Mfg. Company, 50 Cliff street, New York, illustrate a new design of Register, of which they are making a variety of sizes, as there indicated, alluding also to their Registers, Ventilators, Furnaces, Ranges, &c., which are represented in their catalogues

The Lovell Mfg. Company, Erie, Pa., issue a price list under date March 1, giving quotations on Clothes Mangles, Clothes Wringers, Folding Wash Benches, Delusion, Bonanza and Easy-Setting Choker Mouse Traps, Folding Wire, Erie and Gem Rat Traps, Cork Pullers and Trucks.

The trade will observe on page 47 the announcement of Haydock & Bissell, 15 Park Place, New York, of a peremptory sale, April 18, in which a line of Shelf Hardware, Hammers, Saws, Chisels, Garden Sets, Tacks, Nails, &c., is offered to the trade.

With reference to their strike the Enterprise Mfg. Company, Philadelphia, Pa., make the following formal statement as to its occasion:

#### TO THE HARDWARE TRADE.

We are pleased to announce that we have succeeded in filling our foundry with new molders, and we are now able to fill all orders promptly. Our former molders struck on account of the price we offered to pay for molding a Lawn-Mower Wheel. At this price a good molder could readily earn \$4 per day, and, as this was not satisfactory to a Grievance Committee who appeared to control their actions, after a full discussion of the subject we could not agree, and they struck.

#### Obituary.

Nathan Wilkinson, of Wheeling, W. Va., who died at an advanced age on March 18, was a man of sufficient prominence in the Nail trade for many years to justify extended notice. He was a native of New England, and in his early days was engaged in the manufacture of Steel in Massachusetts. Afterward he was connected with the Whitaker Iron Works, at Elko, Md., and removed to Wheeling in 1855, assisting in the establishment of the Riverside Iron Works, which has since grown to such important proportions. Excepting the period of the Civil War, when he was in the army, Colonel Wilkinson was connected with this company from their foundation up to 1882, when he retired, holding the office of secretary of the corporation at that time. He is described by his associates as one of the most genial and companionable of men, whose motives were founded on the highest principles and who was the soul of honor in all his dealings. He is referred to as having been universally popular, living without a stain and dying without an enemy.

#### Exports.

BY BARK STAR OF THE EAST, MARCH 26, 1889, FOR ADELAIDE, AUSTRALIA.

By W. H. Crossman & Bro.—1170 pounds Nails, 1½ dozen Mangles, 3 gross Polish, 12 dozen Springs, 2 dozen Can Openers, 3 gross Shade Rollers, 3 dozen Wringers, 103 dozen Handles, 254 dozen Handles, 15 Rifles, 12 sets Tools, 10,000 Shells, 30,000 Primers, 1000 Cartridges, 50,000 Cartridges, 5 packages Pumps, 6 gross Axle Grease, 23 dozen Axes, 5 boxes Hardware, 1 gross Lawn Sprinklers, 13 packages Lamp Goods, 1 box Hardware, 20 dozen Snaths, 7 cases Hardware, 3 gross Wicks, 80 pounds Tacks, 4½ dozen Wringers. By Mauller & Quereau.—13 cases Forks, 5 cases Cultivators, 42 cases School Slates, 13 packages Mill Machinery and Parts, 20 dozen Washboards, 1125 pounds Castings, 4 cases Skates, 24 dozen Washboards. By R. W. Cameron & Co.—1649 pounds Manila Cordage.

By Arkell & Douglas.—30 dozen Handles, 1 cask Pumps, 1 case Forks, 3448 pounds Pipe Grease.

By Joseph Dixon Crucible Co.—2195 pounds Crucibles.

By R. W. Forbes & Son.—1 case Hardware, 2 cases Hardware, 35 cases Sewing Machines.

By Strong & Trowbridge.—8 cases Choppers, 1 case Hoes, 5 cases Cartridges and Shells, 2 cases Whetstones, 1 case Brushes, 3 cases Tinware, 1 case Hardware, 1 cask Lampware, 1 case Bolts, 1 case Lanterns, 1 case Hoe Handles, 1 case Rubber Goods.

By Winchester Repeating Arms Company.—223 Guns, 48 sets Tools, 200,000 Primers, 100,000 Cartridges, 35 Cartridge Shells.

By McLean Bros & Rigg.—6 dozen Snaths, 7500 Bolts, 3 dozen Axes, 2 dozen Carpet Sweepers, 6 dozen Metal Polish, 1000 pounds Nails, 3 dozen Scoops, 4 dozen Choppers, 3 dozen Hay Forks, 3 dozen Hay Forks, 1½ dozen Pumps, 282 pounds Oil Stone, 1 dozen Cork Pullers, 2 gross Shade Rollers, 21 dozen Handles, 40 dozen Axes, 2000 pounds Nails, 50 gross Clothes Pins.

By H. W. Peabody & Co.—5 cases Hardware, 1 case Perambulators, 36 dozen Handles, 1 case Firearms, 1 case Hydraulic Machinery, 3 rolls Wire Cloth, 100 feet Leather Belting, 16 cases Hardware, 500 Handles, 18 packages Lampware, 140 cases Hardware, 1 case Stencil Combinations, 917 pounds Wire Cloth, 4 cases Clocks, 12 dozen Blacking, 48 dozen Shade Rollers, 12 dozen Wringers, 44 cases Agricultural Implements, 726 dozen Handles, 15 cases Toys, &c., 48 packages Stones, 360 gross Pencils, 60 gross Axle Grease, 42 cases Perambulators, 451 packages Carriage Ware, 1 case Hardware, 6 packages Hardware, 9 cases Agate Ware, 7 packages Lampware, 1 case Wireware, 9 dozen Wringers, 9 packages Hardware, 3 dozen Hammocks, 6 dozen Money Drawers.

By Collins & Co.—101 dozen Tools.

By Goulds Mfg. Company.—1 case Hand Pumps and Parts.

By Reed & Barton.—204 pounds Plated-Ware.

By Meriden Britannia Company.—3 boxes Plated-Ware, 2 boxes Plated-Ware.

BY SHIP W. H. CONNOR, MARCH 28, 1889, FOR SYDNEY, N. S. W.

By Ansonia Clock Company.—24 boxes Clocks, 59 boxes Clocks, 30 boxes Clocks, 12 boxes Clocks, 9 boxes Clocks.

By Simpson, Hall, Miller & Co.—930 pounds Plated-Ware.

By the Parker & Whipple Co.—84 pounds Clocks, 84 pounds Clocks, 84 pounds Clocks, 168 pounds Clocks.

By Waterbury Clock Company.—6 cases Clocks, 6 cases Clocks, 10 cases Clocks, 5 cases Clocks, 6 cases Clocks.

By Meriden Britannia Company.—2 boxes Plated-Ware, 13 packages Plated-Ware, 14 boxes Plated-Ware.

By Arnold, Cheney & Co.—17 cases Axes.

By Coombs, Crosby & Eddy.—80 dozen Handles.

By J. L. Mott Iron Works.—8847 pounds Stoves.

By Russell & Erwin Mfg. Co.—4 cases Hardware.

By A. S. Lascelles & Co.—25 dozen Washboards, 100 dozen Brooms, 53 packages Carts, 100,000 Primers, 2 gross Whisk Brooms, 2 gross Shovels, 1 dozen Axes, 3 dozen Hoes, 108 pairs Roller Skates.

By Arkell & Douglas.—2 cases Saws, 3 packages Pumps and Parts, 16 dozen Glue, 48 dozen Axle Clips, 9 dozen Hooks, 90 pounds Castings, 2 cases Axes, 140 pounds Castings, 2 cases Carriage-Ware, 1½ dozen Braces, 1 case Traps, 1 case Hardware, ½ gross Shovels, 1 case Harness, 1 case Oil Stoves, 25 packages Hardware, 39 Guns, 36 Sets Tools, 150,000 Primers, 50,000 Metallic Cartridges, 100,000 Paper Shells, 56,000 Loaded Shells, 26 cases Handles, 30 dozen Picks, 15 dozen Boilers, 5 cases Saws, 186½ gross Wicks, 4 packages Pumps, 5 packages Hardware, 22 dozen Wrenches, 2 cases Mallets, 65 dozen Traps, ½ dozen Air Guns, 2802 pounds Hammocks, 6 dozen Handles, 8 cases Tacks, 1 case Rat Traps, 48 dozen Faucets, 2 cases Chimneys, 720 dozen Handles, 44 gross Wicks, 15 dozen Brushes, 50 dozen Hammocks, 23 dozen Axes, 5 cases Braces, 10 Ranges and Parts.

By H. L. Judd & Co.—2 cases Brass Goods.

By Singer Mfg. Co.—571 cases Sewing Machines and Parts, 150 cases Sewing Machine Oil.

By J. A. Gifford.—43 packages Perambulators, Toy Wagons and Parts, 1 package Brushes.

By Cordley & Hayes.—4 crates Refrigerators, 11 packages Indurated Fiber-Ware.

By H. W. Peabody & Co.—275 pounds Wire Cloth, 10 cases Carbons, 55 cases Sewing Machines.

By A. Field & Co.—230 dozen Whips, 10 gross Shade Rollers, 10,000 Cartridges.

By F. B. Wheeler & Co.—90 sets Harness, 3 dozen Toy Wagons, 1 set Hardware, 9 dozen

Axes, 3 dozen Saws, 1 dozen Axes, 48 dozen Handles, 2 dozen Axes, 18 dozen Picks, 4 dozen Axes, 4 cases Clocks, 12 cases Buggies and Parts.

By E. W. Harrison.—1 Spice Mill Pump, 1 Spice Mill, 8 dozen Picks, 16 dozen Hardware, 1 case Emery-Wheels, 1 case Pump Fittings.

By R. W. Forbes & Son.—12 packages Windmills, 2 Hay Presses, 2 Pumps, 85 cases Sewing Machines, 1 package Castings, 1 package Feed Mills, 3 dozen Hose Clamps, 6 dozen Thermometers, 16 packages Fire Arms, 500 boxes Clothes Pins, 1 case Hardware, 5 dozen Axes, 4 cases Hatchets, 1 dozen Hammers, 1 case Pumps, 1½ dozen Saws, 1½ dozen Wringers, 12 dozen Axe Handles, 1 case Hardware, 9 dozen Rake Handles.

By Strong & Trowbridge.—4 cases Plows, 5 cases Axes, 1 case Hardware, 5 packages Lampware, 1 case Hubs and Spokes, 7 bundles Rims, 2 bundles Shafts, 2 boxes Tools, 6 packages Castings, 22 cases Cartridges, 2 cases Emery-Wheels, 59 cases Axes, Picks and Brooms and Handles, 15 packages Lamp Goods, 8 cases Hardware, 12 cases Scales, 4 cases Tacks, 1 case Rivets, 3 cases Nuts and Bolts, 2 cases Tools, 26 packages Washboards.

By R. W. Cameron & Co.—150 Gross Bottle Stoppers, 300 dozen Chimneys, 78½ tons Blue Roofing Slate, 10 boxes Buggies and Parts, 4 boxes Machinery, 12 Tires, 3 boxes Pump Fittings, 25 cases Oils, 2 boxes Forks, 4 boxes Scales, 1 box Trucks, 2 Blowers, 1 box Machinery, 5 cases Rock-Breaking Machinery, 44 Castings, 5 dozen Axes, 50 crates Blacking, 5 cases Hardware, 3 cases Harness, 60 barrels Skewers, 8 Pumps, 1898 pounds Manila Rope, 1 box Saddlery.

By Coombs, Crosby & Eddy.—22 dozen Washboards, 19½ dozen Blocks, 82 dozen Blocks, 40 pairs Row Locks, 3 Mills, 1 Pump, 44 Blocks and Iron Parts, 100 boxes Clothes Pins, 35 dozen Washboards, 36 nests Pails, 1000 Handles, 24 gross Clothes Pins, 6 nests Tubs, 4 gross Wood Spoons, 5 dozen Wringers, 38 dozen Hardware, 1 case Velocipedes and Parts, 374 pounds Oil Stoves, 18 Pumps, 2½ dozen Tools, 22 dozen Wrenches, 2 gross Lemon Squeezers and Graters, 6 dozen Hardware, 12 dozen Lemon Squeezers, 2 dozen Churns, 6 dozen House-Furnishing Goods, 25 dozen Edge Tools, 10 dozen Braces, 6 dozen Wire Cages, 18 dozen Hammocks, 13½ gross Hardware, 48 dozen Tools, 6 dozen Traps, 3 dozen Stepladders, 24 dozen Tools, 6 gross Wire Goods, 6 dozen Washboards, 30 dozen Axes, 1 dozen Lamps, 1000 pounds Iron Bolts.

By McLean Bros. & Rigg.—4 packages Plated-Ware, 3 dozen Fluters, 3 dozen Brushes, 3 gross Lemon Squeezers, 20 kegs Axle Grease, 3 gross Shade Rollers, 3 dozen Pruning Shears, 5 dozen Bells, 12 dozen Lanterns, 1 gross Bicycle Oilers, 4 dozen Braces, 32 dozen School Slates, 4 dozen Meat Choppers, 9 Coffee Mills, 250 feet Hose, 31 dozen Dog Collars, 48 dozen Handles, 2 dozen Plumbs and Levels, 3 dozen Scythes, 8 cases Wire Goods, 30 dozen Rakes, 6 cases Wire Goods, 400 pounds Nails, 6 dozen Transom Lifts, 36 dozen Curry Combs, 3100 Brass Shells, 4 gross Glue, 2 cases Granite-Ware, 87 dozen Hatchets, 20 dozen Picks, 63 cases Guns, &c., 30 Pumps, 50 dozen Locks, &c., 12 dozen Razors, 12 cases Lampware, 20 dozen Hammocks, 6 cases Lampware, 100 gross Clothes Pins, 3 gross Mop-Holders, 9 dozen Hammocks, 3 Boring Machines, 9 dozen Axle Grease, 1 dozen Plumbs and Levels, 11 dozen Axes, 2½ dozen Braces, 7 dozen Axe-Handles, 26 Pumps, 38 dozen Saws, 20 dozen Locks, &c.

By V. Basanta.—6 dozen Hammocks, 4½ dozen Planes, &c., 16 dozen Hardware, 3100 Wheels and Axes, 70 Velocipedes, 12 Velocipedes, 884 dozen Handles, 3000 feet Garden Hose, 36 dozen Handles, 46½ dozen Plated-Ware, 10 dozen Axes, 36 dozen Hoes, 334 Clocks, 18 dozen Thermometers, 5 gross Toy Pistols, 3 gross Toy Pistols, 4 gross Darts, 6 Perambulators, 23 cases Slates, 100 gross Wicks, 96 dozen Plated-Ware, 205 dozen Lamp Goods, 540 dozen Handles.

By Winchester Repeating Arms Company.—500,000 Primers, 130,000 Metallic Cartridges, 3000 Shells, 115 Rifles, 120 sets Tools, 86,000 Metallic Cartridges, 5000 Primers, 53 Guns, 86 sets Tools, 27,000 Metallic Cartridges, 30,000 Shells, 50,000 Primers, 16,000 Loaded Shells, 20,000 Paper Shells, 26,000 Metallic Cartridges, 200,000 Primers, 15 Guns, 50 sets Tools, 1 case Revolvers and Shells, 30 Guns, 65,000 Metallic Cartridges, 20,000 Shells, 4000 Loaded Shells, 60,000 Primers.

By Heatly & Earl.—1 case Steam Injectors, 3 boxes Pumps, 2 boxes Saws, 9 boxes Pumps, 4 cases Emery Machinery, 33 packages Windmills.

By W. K. Freeman.—9633 pounds Axes, 1539 pounds Hardware, 5109 pounds Tackle Blocks, 2570 pounds Tackle Blocks.

By Tower Mfg. Company.—6 cases Toy Pistol Caps, 8 cases Hardware, 24 Iron Wagons, 1 case Tinware.

### Arrangement of Stores.

The store herewith illustrated is owned by A. W. Kueken, and is located at 221 North Clark street, Chicago. It is very handsomely fitted up, and in every respect has been made attractive to customers. It was the first retail Hardware store in Chicago to introduce the electric light.

of a gallery suspended from the ceiling, which is accessible by means of a stairway in the rear. This gallery is an ornamental addition to the store and also serves another purpose in forming an excellent place to hang surplus goods on, such as Bird Cages, &c.

Agricultural Tools are suspended from brackets, instead of resting on the floor.

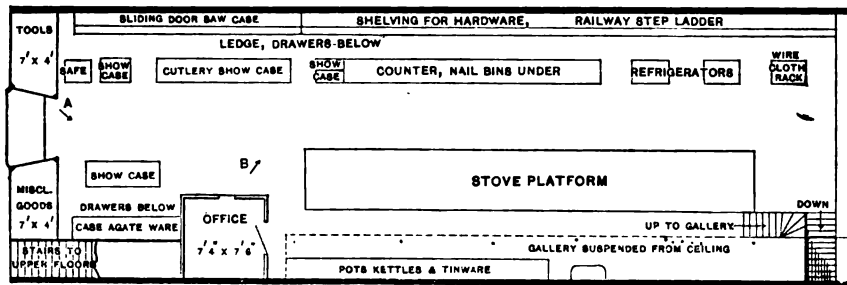

Fig. 328.—Diagram of Store of A. W. Kueken, Chicago.

The walls (wherever exposed) and the ceiling are very artistically papered. The woodwork is of an ornamental character, all of it being finished in cherry. No goods hang from the ceiling. The show-cases are kept brightly polished and in good order, inside as well as outside. The show-windows are made inviting by the display of the newest and freshest goods in original designs, which are often changed. In fact, as the proprietor says, every attempt is made to have this store look as unlike as possible the usual junk shop which is by courtesy called a Hardware store.

One of the show-windows is used for displaying Tools and the other for miscellaneous goods. It will be observed by the ground plan, Fig. 328, that these windows are unusually deep. The Tool window has a platform fitted in the bottom which adds greatly to the effectiveness of the display. It is so made that the back is raised a foot higher than the front. The top is flat, and the front and the sides slope from it to the front and side windows. It is covered with black velvet, which makes a good background for Steel Tools.

The space under the Cutlery showcase is used as a rack for keeping Oil and Gas Stoves. In the Cutlery showcase are arranged a number of jewelers' velvet-lined trays for the display of Pocket Cutlery, &c., which are at night transferred easily to the safe.

The counter, Fig. 329, is located well toward the interior of the store, as the proprietor well remarks that if he can get his customers in far enough to see his full stock they will probably be attracted by something else than just what they went in to purchase. The top of the counter extends several inches over the front, so that ladies will not catch their dresses on the nails in the bins underneath, as they are apt to do when they lean against an ordinary straight counter.

The boxes for Shelf Hardware in this store are all made of tin or sheet iron, with sliding covers. Green paper is pasted on the front of them, and samples of their contents are attached. These boxes are made of various sizes to suit the goods contained in them, and they are usually large enough to hold several small boxes with an assortment of goods, such as Screw Eyes, &c. They were made by Mr. Kueken himself, or in his tinshop, and represent the growth of many years.

The Saw case contains Saws hanging on hooks. Being incased with glass doors they can easily be seen, yet are not exposed to danger of rust.

A railway step-ladder is used to reach the goods on the Hardware side of the store, but the House-Furnishing Goods on the opposite side of the store are reached partly from the floor and partly by means

of these brackets are the ordinary shelf brackets, with an 8 or 10 inch projection. Two of them are screwed to the wall about 2 inches apart. Tools are then slipped into the open space between the brackets, with their handles down. From half a dozen to a dozen Tools of a kind are thus put together. To keep the ends of

have a sliding shelf, about 2½ feet long by 15 inches wide, which can be pulled out to set goods on when they are being examined by buyers. This saves carrying them to a counter.

The Wire Cloth rack, illustrated in Fig. 331, is made of 1½-inch plank, 9½ inches in extreme width. It will hold 20 rolls of Cloth, from 40 inches in width or wider down to 20 inches, or a full assortment of sizes and colors for an ordinary store. It stands 9½ feet high, while the base covered is 29 inches wide by 8 feet deep. The top is 17 inches square. The circles cut for the rolls to rest in are 6 inches in diameter, the mouth flaring to 7 inches to permit the Cloth to be taken out easily. These circles are cut in deep, leaving 2½ inches of thickness to the back of the plank, which allows sufficient strength to support the weight of the Cloth. This rack is braced by cross-pieces, as indicated in the cut, re-enforced by hooks. Hinges are placed on the upper cross-pieces, which enable the rack to be folded flat together at the end of the season and stored away in a smaller space than with the legs stretched as in the cut. Below each roll of Cloth a tab is pasted on the frame giving the width of the Cloth, so that no measuring is necessary at the rack when filling an order. The roll is taken to a counter near by and unrolled when needed, after which it is imme-

Fig. 329.—Counter, Showcases, &c.

the brackets from spreading and letting the Tools fall a stout piece of wire is used, bent in such shape that the ends drop in the screw holes in the ends of the brackets. Axes and Handles are kept in a rack standing on the floor. This consists of a light framework about 2 feet square, having cross pieces for the Handles to rest against and keep them from falling down.

Under the case in which Agate-Ware is kept it has been found very convenient to

diately restored to the rack. It is thus kept in perfect condition at all times.

The basement of the store is occupied partly as a tinshop, and partly to store Wooden-Ware and other heavy and unsightly goods which would detract from the appearance of the store or take up a great deal of room.

The accompanying illustration, Fig. 332, for which we are indebted to "H. N. B.," Nanticoke, Pa., represents a Horseshoe

rack in connection with a counter, and illustrates a compact and convenient method for handling these goods for retail purposes. The rack is made with 8 x 1 inch strips placed upright flush with the inside face of the counter and a corresponding strip on the other side of the counter. Through holes in these strips round pieces of wood or iron are inserted, on which the Shoes are placed as shown in the cut. It will be observed that the upright strips are placed at different distances, so as to permit of easy access to the goods, and it is suggested that between the first and second from the left the distance should be 7½ inches, and between the second and third 2½ inches.

The men went to work as usual on Monday, but during the day a committee called on the general manager and told him they were authorized to say that unless the reduction notice was taken down they would quit work inside of 24 hours. The manager replied that they would work all of this week at the old wages, therefore he did not see that the question of wages was involved. The men left, and in the course of the afternoon they informed the superintendent that they would not work any longer—the night turn not coming on. The clerks are making up the payroll for last week and Monday of this, and they will be paid in full Wednesday. It might be well to state that \$3.50 is the

"Idaho valleys cannot be excelled by any region east of California for the production of fruit. Several of the orchards in the vicinity of Boise City produce from 25,000 to 40,000 bushels of fruit annually. Several companies have been organized and have secured water rights on the Boise River above and below Boise City. They propose carrying the water by different

Fig. 330.—Office, Shelving, Gallery, &c.

The manner in which the upright pieces are marked with the kind and number of the Shoes will be observed.

#### The Situation at the Columbia Mills.

Some four weeks ago the general manager of the Columbia Iron Company told the mill men that in consequence of the Youngstown mill offering iron at \$1.55, less 2 per cent., to their customers in Baltimore and Philadelphia, the price of puddling and other mill wages would have to be reduced, or else the mill would have to shut down, as they could not compete with these prices (the wages being for puddling \$3.85, and other wages in proportion), but the men did not seem inclined to make any concessions. The next move was on the part of the three mills in Columbia and the Pennsylvania mill at Lancaster to put up a notice in their mills on Saturday, March 23, informing the men that on Monday following two weeks the price of puddling would be reduced to \$3.50, and other mill work in proportion. Nothing was said on the part of the men whether they would accept or not. The Columbia mill, being short of orders, put up a notice on Saturday, March 30, leaving up the other notice, informing the men that owing to a depressed condition of the trade the mill would be closed on the following Saturday indefinitely. The men would be paid their wages in full on the following Tuesday.

outside price paid in Eastern Pennsylvania, except the few mills in Philadelphia, which, on account of high rents and living, pay \$3.85. We have since heard that the men at the Pennsylvania mill at Lancaster have given notice that they would not submit to the reduction, and yesterday the men of the Susquehanna Iron Company, of Columbia, did the same. The men at the Columbia Rolling Mill Company will accept the reduction.

#### Irrigation in the Arid West.

By artificial irrigation the area of tillable land in the great West is making constant inroads on the sterile tract formerly known as the "American Desert," the fact having been demonstrated that even sagebrush lands once considered utterly worthless can be easily made to yield the finest fruits. The new State of Idaho is one of the regions where irrigation has been introduced with surprising success. One of the most prominent farmers in the Boise Valley recently made the following statement: "On 10 acres of our poorest land and with imperfect irrigation I raised 40 tons of red-clover hay; sold 75,000 pounds (1,250 bushels) of onions from 2 acres; potatoes gave 500 bushels to the acre; have raised 1,000 bushels on 2 acres; have also raised 113 bushels of barley on an acre; wheat from 40 to 60 bushels; oats, 100 to 150 bushels; carrots and turnips equally good with potatoes." Another, for some year a citizen of the Territory, says:

Fig. 331.—Wire-Cloth Rack.

routes across the rich plains traversed by the Idaho Central and the Oregon Short Line railroads." In New Mexico, too, considerable amounts of capital are being introduced by Western men to promote irrigation. The Springer Land Association will build 200 miles of canal in the Red River Valley and vicinity, and several other organizations are engaged in similar enterprises.

Many towns in South Dakota have been desolated by prairie fires. In Sully and Hughes counties the loss of property is computed at \$200,000 and in Lincoln County the losses foot up an equal amount.

Fig. 332.—Horseshoe Rack in Counter.

The wind at times blew at the rate of 50 or 60 miles an hour, carrying dense clouds of smoke and dust.

We are indebted to W. H. McGugin, of Olin Furnace, for a copy of the industrial edition of the *Ironton Weekly Republican*, under date of Ironton, Ohio, March 30. One of its features is the description of the well known iron-making plants of Ironton and its vicinity.

Gordon, Strobel & Laureau, Limited, of Philadelphia, have just completed four large Don injection pumps for the Claus Spreckels Refinery at Philadelphia. The pumps are 32 and 26 by 49. They are also building two 16 and 24 by 38 pumps and centrifugal baskets for the same refinery.

### The Phelps Combination Plane.

This article, illustrated herewith, is put on the market by the Auburn Tool Company, Auburn, N. Y. It will be seen that the tool may be used as a plane, level and rule. It is described as made of straight-

vice in opening letters will be appreciated, as well as the fact that its cutting  $6\frac{1}{2}$  inches adapts it to opening ordinary business envelopes. The machine is finished with enameled and nicked parts, and is warranted to work perfectly, the manufacturers stating that they will return the

*The Phelps Combination Plane.*

grained white beech, which is not liable to warp or break where the bit is inserted. The levels are set in plaster-of-paris on the side of the plane, as shown. The plane is made in two lengths, P. C. jack plane, 16 inches long,  $2\frac{1}{4}$  or  $2\frac{1}{2}$  inch iron, and P. C. fore plane, 22 inches long,  $2\frac{1}{4}$ ,  $2\frac{1}{2}$  or  $2\frac{3}{4}$  inch iron. The jack planes are packed 24 in a case, the fore planes being packed 12 in a case. The manufacturers allude to the convenience of this tool for use in odd jobs, avoiding, as it does, the necessity for carrying a level, and also about the house and farm. They refer also to the low price at which it is sold, its cost being but a trifle more than the ordinary plane.

### Envelope Opener.

The Winslow & Curtis Machine Screw Company, Worcester, Mass., are putting on the market the envelope opener represented below. From the illustration it will be seen that there are two cutting knives, one of which is stationary and the other operated by a blow or pressure, their operation being such as to cut a narrow strip from the edge of the envelope placed between them. In connection with the upper knife there is a movable and adjustable gauge which regulates the depth of the cut, and by means of the screws on either side of the handle the position of this gauge is easily regulated. By means of this gauge

money for any cutter sold and for any reason proving unsatisfactory.

### A New Brush Hook.

Horton, Gilmore, McWilliams & Co., of Chicago, have just brought out a brush hook of a special pattern, which is illustrated herewith. Being their own pattern, its manufacture and sale are exclusively controlled by them. It is an improvement on the hook formerly known as the Hamilton or Illinois brush hook. A feature of the original Hamilton hook which was particularly meritorious but had been lost sight of by subsequent manufact-

*Brush Hook.*

urers, has also been restored. This feature is the placing of the cutting edge on a line with the bottom of the handle, which prevents it from turning in the hand. It is improved in enlarging the implement both by increasing the length and the thick-

the design of the maker of the original Hamilton hook. The blade is described as being made of the best quality of steel.

### The Gargrave Shear.

Michael Greenebaum's Sons, of Chicago, are the exclusive manufacturers of a shear of new design, which is adapted to the

*The Gargrave Shear.*

use of blacksmiths and other consumers of bar iron and steel. It is illustrated herewith. The most novel feature about it is the double cam or eccentric at the end of the lever. This is claimed to be the first

*The Winslow & Curtis Envelope Opener.*

the smallest possible margin may be cut from the envelope to prevent all danger of cutting open the letters or their contents, as is frequently done by the insertion of a blade into the envelope. The front cutter may also be adjusted by means of the screws, as shown. The envelope opener will, however, need adjustment in rare cases only, as the cutters are carefully fitted for use before leaving the factory. The convenience of this de-

ness of the blade, making it heavier, and therefore more effective for varied work in trimming hedges, &c. A different curve has also been given to the edge, whereby a draw cut is made with facility. A change has been made in the form of the nib at the edge, whereby a branch can be either pushed or pulled out of the hedge. With this tool the double work can be performed of making a slashing cut or of trimming hedges, which was

application of a double cam to regulate power. In cutting light iron, or iron so wide as to require the full capacity of the knives, the larger cam is used. In cutting heavy iron, requiring more power, the smaller cam is brought into play. The setting of the cams is effected by means of a small wedge, which is slotted to slip down on the pin on which the cams work. One twist of the nut on the end of the pin loosens the wedge, which can then be put on either side of the cams, as desired, so as to bring either the large or the small one on the shear blade. A device which is shown in the cut holds the bar in place, thus enabling one man to operate the machine. A stiff spring raises the upper blade and opens the shear as soon as the lever is released. The knives are in plain sight, so that the operator can cut to a pencil mark. The tool is made of steel and wrought iron, in four sizes.

### Monroe Bros.' Refrigerators.

Cordley & Hayes, 37 Barclay street, New York, are putting on the market Monroe Bros' indurated fiber-lined and stone-ware-lined refrigerators, for which they claim several points of excellence. Its chief superiority, they say, lies in the fact that indurated fiber is practically indestructible, free from all oxides and poisons, and will not absorb odors and thus become foul. Furthermore, it provides for a perfect circulation of cold air, its drip-pipe cannot overflow and is always clear, and is filled with mineral wool, one of the best non-conductors of heat in use.

The circulation of dry air is accomplished by the arrangement of large ducts beneath the ice racks in the ice chamber, through which the cold air falls into the

provision compartments, forcing the warmer air through an independent passageway for it in front of the provision compartments to the top of the ice chamber; the warmer upward current of air carries all the vapors and minute particles of food, as fast as they are given off by the provisions, to the top of the ice chamber, where the vapors are condensed and the minute particles of food deposited on the ice and carried off by the drippings from it. The condensation takes place and the deposit is made before the air again reaches the cold-air ducts for the next downward passage, hence the downward current is

Sectional View of Drip Pipe.

always dry and pure. The upward current of air, which carries off the vapors and odors, passing in front of the provision compartments, not through them, prevents any mixture of flavors or tastes, one compartment with another.

Attention is also called to the fact that the refrigerators are built in sections for convenience in handling. A sectional view of the drip-pipe is shown in the cut. The top of the cut shows the sloping bottom of the ice chamber with a small pipe extending about one inch below it and directly over the center of a two-inch pipe with a wide funnel-shaped mouth. Below the latter pipe is a similar one extending through the bottom of the refrigerator. The dotted line extending through the center of the pipes represents the dropping water, which passes through the two pipes without touching them and falls into the cup trap below, which is shown disconnected from the bottom of the pipe. Should straw or sawdust from ice not carefully washed clog the trap it will automatically open and clear the pipe, thus

Combined Belt Punch and Awl.

preventing any overflow of water in the refrigerator. The cut represents the drip in a three-section refrigerator, but the same system of drainage is used in refrigerators built in one or two sections.

#### Combined Belt Punch and Awl.

This article is made by the Humphrey Tool Company, Warren, Mass., and its construction and utility are indicated in

#### Frary's Corkscrews.

The illustrations presented herewith represent corkscrews of special design, which are put on the market by James D.

Fig. 1.—Combined Corkscrew, Can-Opener, Ice-Pick, &c.

the illustration given below. It is to be observed that by means of the spring the handles are separated, so that when using the tool as an awl the unused handle is out of the way, while at the same time the combination of the two tools in one is referred to as very convenient. The

Frary, Meriden, Conn. Fig. 1 represents a spiral twist screw with a metallic handle, combined with which is a can-opener and pick or wire-stripper. It is made in two different styles of finish, one of which is full nickel-plate and the other bronzed, with nickel-plated trimmings. Fig. 2 rep-

Fig. 2.—Combined Corkscrew, Ice-Pick, Breaker, &c.

tube is described as made of fine steel, and can be replaced at any time should it become worn or injured. The body of the tool is also made of steel and is finished in japan, the handle being of rosewood. This article is intended especially for belt

resents the Electric self-drawing corkscrew combined with nickel-plated pick or wire-stripper and ice-breaker. Its construction is referred to as such that when inserted in the cork and turned until the revolving bell reaches the cork, a continued turning will extract the hardest cork without difficulty. This article is also made in two styles of finish, one of which is in full nickel-plate and the other bronzed, with nickel-plated screw and trimmings. The quality of the steel in both of these corkscrews and the fact that it is hardened and tempered is alluded to, as well as the convenience of the combinations that are secured.

Many strikes have been started in the building trades in Buffalo, Cleveland and other Western cities within the last few days, and the trouble is expected to culminate about May 1. In St. Louis the bosses refuse to recognize the Carpenters' Brotherhood, so that the prospects of unusual activity at various points are not as good as they were.

### The Boss Flush T-Bevel.

The Hill Bevel Company, North Manchester, Conn., are putting on the market the flush T-bevel illustrated below, which they designate as the Boss. As shown in the cut, the disk in the end of the frame attached to the blade is divided by lines marked with the characters S, W, 8, 6, M, which indicate the following angles:

*The Boss Flush T-Bevel.*

S for square; W for window or sill pitch, or angle of  $9^\circ$ ; 8 for octagon or "8-square," or angle of  $22\frac{1}{2}^\circ$ ; 6 for hexagon or "6-square," or angle of  $30^\circ$ ; M for miter, or  $45^\circ$ . To obtain any of these angles the blade is to be moved until the mark on the disk is in line with the center mark on the end of the frame, when the bolt on the side of the frame may be engaged with the blade and lock it in the proper position, when it can be further fastened by screwing down the thumb-nut. When the pressure of the thumb or finger is removed from the bolt, it is brought back to its original position by means of a spring, and the bevel can then be used the same as common bevels.

### Woven Iron.

In a recent number of *The Manufacturer and Builder*, Henry D. Plimssoll, of No. 88 Nassau street, New York, describes a fabric wool of iron bars, of which he is the inventor. The appearance and structure of the fabric is shown in the accompanying engraving. The process by which this result is obtained is exceedingly simple, the bars being corrugated separately, with such a difference between the corrugations of the longitudinal and cross bars as will permit of openings, when they

*Woven Wrought Iron.*

are placed in position, for the insertion of straight interlocking bars. Simple as this contrivance is, the fabric, it is said, is exceedingly strong, and, unlike the bridge that "did not bend, but broke," it (the fabric) may bend, but cannot break—it can only be got apart by reversing the process of construction. It is also capable

of being made in a great variety of patterns, varying according to the size, weight and shape of the bars or the size of mesh. The tube iron can also be woven in the same way. The purposes to which it may be applied are as follows: A protection for the interiors and exteriors of private dwellings, prisons, safe deposit vaults, and other public buildings, as a fabric made, say, of one-inch bars, with meshes three inches

square, while not interfering with the light, would require a large amount of cutting before an opening could be made sufficient for the passage of a man's body. For railway cross-ties, as, where several pieces are so arranged, while there would be suffi-

*The California Lawn Sprinkler.*

cient firmness, there would still be sufficient "give" to prevent the wear and tear of tires and rails that is the usual accompaniment of a rigid iron cross-tie. The inventor believes that it would be useful as a netting about ships for protection

of the association is to obtain a classification of freight rates which will put them on an equality with Western manufacturers. At present, they say, the rates eastward are less than half those westward.

### The IXL Double-Handle Steel Stove Shovel.

The accompanying illustrations, Figs. 1 and 2, represent a line of double-handle steel stove shovels put on the market by L. C. Beardsley & Co., Cleveland, Ohio, who have applied for a patent on the same. The special feature of these goods is indicated in the name, the handle being made from two pieces of steel formed in the shape of a half oval, making a hollow oval handle, which is referred to as an easy

*The IXL Double-Handle Steel Stove Shovels.*

fit for the hand. The pieces are riveted together with the scoop between the lower ends, giving strength at the heel of the shovel both inside and outside, where it is most needed. The illustrations give, it will be observed, a bottom and top view of shovels of different patterns and show the manner in which they are formed. These goods are made in three sizes, with sizes of scoop  $5 \times 7\frac{1}{2}$  inch,  $5 \times 8\frac{1}{2}$  inch and  $5\frac{1}{2} \times 9$  inch, and handles 16, 22 and 25 inches long. The durability of the shovels is one of the points on which special emphasis is laid.

### The California Lawn Sprinkler.

Nimick & Brittan Mfg. Company, Pittsburgh, Pa., are manufacturing for Farnsworth & Co., San Francisco, Cal., the lawn sprinkler illustrated herewith. The bearings are described as babbitted with the best Babbitt metal, and the manufacturers claim that they will not leak, wear or get out of order. It is pointed out that the use of this anti-friction metal the sprinkler can be run with very light pressure, and that it will water evenly a space of from 20 to 60 feet square, according to the pressure applied. Its efficiency and economy in the use of water, as well as the low price at which it is offered, are emphasized by the manufacturers.

# CURRENT HARDWARE PRICES.

APRIL 10, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, APRIL 18, 1889.

## Submarine Railroad Tunnel.

A grand railroad tunnel beneath the bed of the river St. Clair, at Port Huron, Mich., to cost probably \$5,000,000, is among the most important of modern engineering projects. The engineers Sooy-smith & Co., of New York, contracted with the Grand Trunk Railway Company for the work and preliminary surveys were made some months ago. The company now take charge of the project. The work of excavation on the American side will begin about 2500 feet back from the river, from which point there will be a steady decline to a depth of about 50 feet. The drift from the tunnel proper will be 22 feet in diameter, and the distance from one river bank to the other is 2200 feet.

Treasury Department decides that the steel plates for the tunnel must pay the regular duty.

## Rolling Mill.

The accompanying illustration represents a 4-ton rolling mill recently built for the Chicago Tire and Spring Company by the Coulter & M'Kenzie Machine Company, of Bridgeport, Conn. It is designed particularly for tapering the 5 x  $\frac{1}{4}$ -inch steel plates used for locomotive truck springs. All the parts liable to wear or break are made of steel.

On the front of the machine is a sliding table, arranged for squeezing and straightening the blank. The faces of the rolls are so formed and so placed in relation

on three or four cents a day and get decent clothing for \$5 a year. The Admiral says there is no reason except the timidity of American capitalists to prevent our having a large share of the trade of this great and growing country, soon to make itself felt among the family of nations. He cannot see why they should not have American machinery or why there should be a fleet of 50 merchant steamships built by the English instead of by Americans. He can see no reason why our present commerce with Japan should be carried in English bottoms any more than the date crop of Persia should be brought to us by the English. As an illustration of the way the English ships do it, the Admiral says he came home in an English "ocean tramp" steamship, which started at Yokohama

ROLLING MILL, BUILT BY THE COULTER & M'KENZIE MACHINE COMPANY.

The tunnel will have a drop of 90 feet to the mile, the lowest end being on the Canadian side. The work of excavating in the tunnel will be done with large steel "shields," 22 feet in diameter, driven into the earth with 24 powerful hydraulic jacks. A large hydraulic engine will be used to work the jacks, and as fast as the earth is excavated it will be loaded on small trucks for removal. A gang of men will follow with the lining of the tunnel, which is cast iron. The tunnel will thus be completed as the work progresses. A blowing engine will force air into the tunnel through a 24-inch pipe. A force of 125 men will be employed on each side of the river night and day. The Collector at Port Huron reports that it will take about three months to put the plates together in the required form. The finished tunnel will comprise 2500 feet on the American side, 2200 under the river and 3000 on the Canadian side. It is estimated that the work will cost \$2,500,000, although well-informed men predict that it will cost nearer \$5,000,000. President Sir Henry Tyler and Manager Hickson have been heard to remark that it will be completed if it costs \$10,000,000. The United States

to each other as to give to the ends of the blank the taper found in spring plates. This action of the rolls spreads the ends and increases the width of the plate at those points. This excess is reduced by the sliding table, which moves transversely in front of the rolls, and is operated by a pitman connecting one end with a crank or eccentric on a shaft driven by the upper roll-shaft through beveled gearing. This machine may be used for forming file blanks, or similar work now usually done under the hammer. Tapering, squeezing and straightening are performed at one heat, and can be carried on as rapidly as the blanks can be heated and fed to the machine.

**Progress in Japan.**—Admiral Shufeldt, just returned from Japan, gives a glowing description of that country, with its postal service as good as our own, excellent telegraph system, free public schools everywhere, a national mint and banking system similar to the American, &c. The Admiral saw few beggars in Japan or large prisons and almshouses. Neither is there any great accumulations of wealth. The common people can live

and stopped at various ports in China and came through the Suez Canal, picking up cargo for New York all the way, and arriving here with about 5200 tons of freight, realizing \$60,000 for the ship at a cost of only about \$30,000. This ship was managed by a crew of about 43 men all told, with all modern appliances, and needed only four men on deck to keep her running. She came through the Suez Canal with nine other ships, eight of which were English.

An underground railroad project just brought out in Philadelphia causes much excitement. The scheme involves the expenditure of at least \$25,000,000. The corporation has been organized as the Broad and Market Streets Underground Railway Company. P. P. Bowles, manager of the Fairbanks Scale Company, is the president. Ex-Gas Trustee James E. Salter is the secretary and treasurer. The plans are for the construction of a four-track road. Two tracks are to be set aside for fast trains and the other two for trains that will stop at stations to be erected about half a mile apart.

### The New Inman Steamer City of Paris.

According to reports of English newspapers, the new steamer City of Paris, which recently made her first trip across the Atlantic, bids fair to rival in speed the present ocean greyhounds. When steaming toward the Alfred Dock, Birkenhead, she performed the remarkable feat of turning almost around in her own length, thereby greatly increasing the interest of the spectators who were watching her. The new vessel is a *fac-simile* of the City of New York, but is expected, in regard to her steaming qualities, to far distance her prototype. According to the present plans, she will first be submitted to a thorough and practical test of one or more voyages to New York in order to insure easy working of her machinery. The reports state that on the trial trip, when the water was a trifle rough and the wind strong, the ship was driven at 15 knots, then at 18, then at 20, the engines all the time working with complete satisfaction. The final trip was an extended run, during which 21.59 knots an hour were registered. During the run from Greenock to Liverpool, with strong head winds and through a choppy sea, the ship made 20 knots an hour, this rate being continued the greater part of the night. Although the City of New York and City of Paris are sister ships, laid down at the same time and built from the same designs, the latter has occupied six months longer in construction. The building of the City of New York was pushed forward to meet the press of traffic; but the City of Paris has been carefully and elaborately finished, and her engines have received the most minute attention, and the result is that, although new, the machinery has worked without the slightest hitch. Two years were occupied in the building. Except that in the newer ship the Inman Company have discarded some of the patent apparatus which in the City of New York worked unsatisfactory, the two vessels are in every detail identical. Like the City of New York, this latest addition to the Inman line is 565 feet long over all, 63½ feet broad, 42 feet deep, and 10,500 tons gross register. Her engines are capable of developing 20,000 horse-power. She has five decks, and the depth of the hold is 39½ feet. Accommodation is provided for 2000 passengers—700 first-class, 390 second-class, and the remaining 910 steerage. As regards her decorations and appointments, the vessel is literally a floating palace, replete not only with every comfort, but luxury. She has a promenade deck extending from stem to stern. Below, the saloon dining-room is capable of accommodating 300 passengers; it is the width of the ship, and has an arched roof 20 feet high, with alcoves along the sides. At the after end of this spacious saloon there is a large hall, in which is placed a grand staircase leading down to the luxurious drawing-room and library. The smoking-room, another elaborately fitted apartment, is on the upper deck. It is 45 feet long and 27 feet broad, and will hold 130 votaries of the weed. It is a feature of the City of Paris, as of her sister ship, that there are provided for saloon passengers a number of elegantly appointed private sitting-rooms, as well as private bathrooms. Altogether the state-rooms for first-class passengers number about 480. For the second-class passengers there have been provided a tastefully decorated and elegant dining hall, 40 feet wide, 27 feet high, and capable of holding 150 diners. There are also 96 second-class state-rooms. The ship is divided into water-tight compartments, without doors, and would be perfectly seaworthy with three of these divisions flooded. She has a double bottom, capable of holding 1500

tons of water ballast, and to prevent her rolling is fitted with a water chamber, extending the width of the ship and half filled with water, by which any tendency to oscillation is so successfully counteracted that on the passage from Glasgow the motion of the ship was scarcely perceptible. She is lighted by 1000 incandescent electric lamps, fed by a current from five powerful electrical machines stationed in the engine-room.

### Natural Gas vs. Coke and Coal.

Prof. S. A. Ford, chemist of the Edgar Thomson Steel Works, at Braddock, Pa., recently contributed the following interesting article to the Greensburg (Pa.) Press, which we reproduce:

So much has been claimed for natural gas as regards the superiority of its heating properties as compared with coal that some analyses of this gas, together with calculations showing the comparison between its heating power and that of coal, may be of interest to your readers. These calculations are, of course, theoretical in both cases, and it must not be imagined that the total amount of heat in a ton of coal or in 1000 cubic feet of natural gas can ever be fully utilized. In making these calculations I employed as a basis what in my estimation was a gas of an average chemical composition, as I have found that gas from the same well varies continually in its composition. Thus, samples of gas from the same well, but taken on different days, vary in nitrogen from 23 per cent. to *nil*, carbonic acid from 2 per cent. to *nil*, oxygen from 4 per cent. to 0.4 per cent., and so with all the component gases. Before giving the theoretical heating power of 1000 cubic feet of this gas I will note a few analyses. The first four are of gas from the same well, samples taken on the same day that they were analyzed. The last is from another well in the East Liberty district.

I also give a few analyses of Siemens producer gas. The immense heating power of the natural gas over the Siemens may be seen at a glance when compared bulk for bulk:

Natural Gas.					
	1.	2.	3.	4.	5.
When Tested.....	Oct. 23, 1884.	Oct. 29, 1884.	Oct. 24, 1884.	Dec. 4, 1884.	Oct. 18, 1884.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Carbonic acid.....	0.8	0.6	<i>nil</i>	0.4	<i>nil</i>
Carbonic oxide.....	1.0	0.8	0.58	0.4	0.1
Oxygen.....	1.1	0.8	0.78	0.8	2.10
Olefiant gas.....	0.7	0.8	0.98	0.6	0.8
Ethylid hyd'e.....	3.6	5.5	7.92	12.3	5.2
Marsh gas.....	72.18	65.25	60.70	49.58	57.86
Hydrogen.....	20.62	26.16	29.03	35.92	9.64
Nitrogen.....	<i>nil</i>	<i>nil</i>	<i>nil</i>	<i>nil</i>	23.41
Heat units.....	728,746	698,853	627,170	745,813	592,380
Siemens Producer Gas.*					
Carbonic acid.....	3.9	8.7	9.3	1.5	6.1
Carbonic oxide.....	27.3	20.0	16.5	23.6	22.3
Hydrogen.....	.....	8.7	8.8	6.0	23.7

\* See Vol. XI, p. 800, Transactions of American Institute of Mining Engineers.

We will now see how the natural gas compares with coal, weight for weight, or, in other words, how many cubic feet of gas will contain as many heat units as a given weight of coal—say a ton. In order to accomplish this end we will be obliged, as I have before said, to assume as a basis for our calculations what I consider a gas of an average chemical composition, namely:

	Per cent.
Carbonic acid.....	0.6
Carbonic oxide.....	0.6
Oxygen.....	0.8
Olefiant gas.....	1.00

Ethylid hydride.....	5.00
Marsh gas.....	67.00
Hydrogen.....	22.00
Nitrogen.....	3.00

Now, by the specific gravity of these gases we find that 100 liters of this gas will weigh 64.8585 grams, thus:

Marsh gas.....	67.0 L.	weighs	48.0256 grms.
Olefiant gas.....	1.0	"	1.2534 "
Ethylid hydride.....	5.0	"	6.7200 "
Hydrogen.....	22.0	"	1.972 "
Nitrogen.....	3.0	"	8.7652 "
Carbonic acid.....	0.6	"	1.2257 "
Carbonic oxide.....	0.6	"	0.7526 "
Oxygen.....	0.8	"	1.1468 "

Total..... 64.8585

Then if we take the heat units of these gases we will find that:

	Grams	Heat units.
Marsh gas.....	48.0256	627,358
Olefiant gas.....	1.2534	14,910
Ethylid hydride.....	6.7200	77,679
Hydrogen.....	1.9712	87,930
Nitrogen.....	3.7680	.....
Carbonic oxide.....	0.7526	1,806
Carbonic acid.....	1.2257	.....
Oxygen.....	1.1468	.....
Total.....	64.8585	789,604

64.8585 grams is almost exactly 1000 grains, and 1 cubic foot of this gas will weigh 267.9 grains; then the 1000 liters, or 64.8585 grams, or 1000 grains, is 3.761 cubic feet. 3.761 cubic feet of this gas contains 789,604 heat units and 1000 cubic feet will contain 210,069,604 heat units. Now, 1000 cubic feet of this gas will weigh 265,887 grains, or, in round numbers, 38 pounds avoirdupois. We find that 64.8585 grams, or 1000 grains, of carbon contains 52,404 heat units and 265,887 grains, or 38 pounds, of carbon contains 139,398,896 heat units. Then 57.25 pounds of carbon will contain the same number of heat units as the 1000 cubic feet of the natural gas—viz., 210,069,604. Now, if we say that coke contains in round numbers 90 per cent. carbon, then we will have 62.97 pounds of coke equal in heat units to 1000 cubic feet of natural gas. Then if a ton of coke, or 2000 pounds, costs \$2.50, 62.97 pounds will cost 7½ cents, or 1000 cubic feet of gas is worth 7½ cents for its heating power.

We will now compare the heating power of this gas with coal, taking as a basis a coal slightly above the general average of the Pittsburgh coal—viz.:

Carbon.....	82.75
Hydrogen.....	5.31
Nitrogen.....	1.04
Sulphur.....	0.95
Oxygen.....	4.64
Ash.....	5.31

We find that 38 pounds of this coal contains 146,903,820 heat units, then 54.4 pounds of this coal contains 210,069,604 heat units, or 54.4 pounds of this coal is equal in its heating power to 1000 cubic feet of the natural gas. If our coal costs us \$1.20 per ton of 2000 pounds, then 54.4 pounds costs 3½ cents, and 1000 cubic feet of gas is worth for its heat units 3½ cents. As the price of coal increases or decreases the value of the gas will naturally vary in like proportions. Thus, with the price of coal at \$2.50 per ton, this gas will be worth 6½ cents per 1000 cubic feet. If 54.4 pounds of coal is equal to 1000 cubic feet of gas, then 1 ton of coal is equal to 36,764 cubic feet. In these calculations of the heating power of gas and coal no account is, of course, taken of the loss of heat by radiation, &c. My object has been to compare these two fuels merely as regards their actual value in heat units.

In collecting samples of this gas I have noted some very interesting deposits from the wells. Thus, in one well the pipe was nearly filled up with a soft grayish-white material, which proved on testing to be chloride of calcium. In another well, soon after the gas vein had been struck, crystals of carbonate of ammonia were thrown out, and upon testing the gas I found a considerable amount of that alkali, and with this well no chloride of calcium was observed until about two months after the gas had been struck.

**Hand or Power Molding Machine.**

This machine may be operated either by hand or power, so that, if desired, the compression may be produced by power, or, in the absence of power, it may be produced by hand. The two platens are arranged one above the other, the lower moving up and down and the upper swinging backward and forward; when the latter is brought forward over the other the mold on the lower is forced up against the upper platen to compress the sand, and then as the lower platen drops the upper is thrown backward for the removal of the prepared mold and the preparation for another. The lower platen is supported upon two vertical slides working through guides in the bars of the frame. Placed in bearings in the lower part of the frame is a rock shaft having a backwardly projecting arm, upon which rests a strut bearing against the under side of the lower platen, so that when the shaft is turned it

HAND OR POWER MOLDING MACHINE, MADE BY REYNOLDS & CO.

will raise or lower the platen. The shaft is operated to produce the compressing movement by means of an elastic lever. The upper platen is carried by two rods hung on trunnions at their lower ends. In operation the flask and sand with the mold are placed upon the lower platen, when the upper platen is drawn forward and the lever moved to raise the lower platen and compress the sand in the mold.

Power is applied to the machine by a cam working against the back of the spring lever and mounted upon a shaft to which power is transmitted. The construction is such that the rock or cam shaft only rises to produce compression when the upper platen is in its forward position over the lower; a single revolution of the shaft then produces the compression, when power is automatically detached. When it is desirable to operate the machine by hand the power attachment can be easily disengaged.

This machine is made by Reynolds & Co., of New Haven, Conn., who also manufacture other forms of molding machines which have been long and favorably known.

The grand ship canal between Liverpool and Manchester is being made with wonderful rapidity. An English paper says

an army of 15,000 men, supplemented by colossal steam diggers, scoop out day by day the pathway along which steamships will ere long glide to and from Cottonopolis and the sea.

**The Past and Present of Pittsburgh Natural Gas.**

A recent circular, relating to a proposed new mortgage loan of \$2,500,000 of the "Philadelphia Company," Geo. Westinghouse, president, and Chas. Paine, vice-president and general manager, who practically control the natural gas supply in and around Pittsburgh, gives a succinct statement of the past and present of this great product:

*Organization.*—The Philadelphia Company were reorganized May 24, 1884, under the provisions of a special charter, originally granted to the Empire Contract Com-

pany by an act approved March 20, 1871. The rights, powers, privileges and franchises conferred by and in said act of incorporation are exceptional in their nature and value, and are enjoyed by no other natural gas company.

*Business.*—Notwithstanding the liberal scope of its charter, the business of the company is at present confined to the mining, conveyance and sale of natural gas. Although the existence of this wonderful product has been known for centuries, and its utilization attempted in a small way ages ago, the year 1875 marked its first introduction in the manufacture of iron, and not until the product of the famous Murrysville Well was piped to Pittsburgh in 1883 did the people of Western Pennsylvania realize its value and recognize in it the fuel of the future.

*The Past and Present.*—Entering the field in 1884, the Philadelphia Company found it already occupied; but, equipped by the inventive genius of their promoter, Mr. Geo. Westinghouse, Jr., with many appliances for the safe conveyance of gas, and backed by a capital of \$5,000,000, subsequently increased to \$7,500,000, the Philadelphia Company soon distanced their competitors. So great was the advantages gained by an unfailing supply of gas, superior facilities for delivering the same,

and an almost entire immunity from accident, that finally most of the competing companies sought and obtained the privilege of incorporation with the Philadelphia Company, or placed their lines in their hands for operation under lease. Thus the company practically control the gas supply of the cities of Pittsburgh and Allegheny and their suburban villages; also 13 surrounding towns and boroughs. Reference to the accompanying map (not engraved) will show the extent of the company's mains and their favorable location. Originating in the three greatest anticlinal reservoirs yet discovered—Murrysville, Grapeville and Canonsburg—they carry the product of 200 producing wells to Pittsburgh by 19 different routes, supplying on the way the towns and villages mentioned. By a comparatively small expenditure the adjacent fields of Bakertown and Belle Vernon, where the company have large tracts of promising gas territory in reserve, can be made tributary to the company's supply.

*The Low-Pressure System.*—The cities of Pittsburgh and Allegheny are supplied with gas at low pressure through a system of mains and service lines aggregating 258 miles in length, of which 206 miles, owned in fee by the company, cost considerably more than \$2,500,000. This portion of the company's work is practically completed, nearly every street of any consequence having already been piped. The principal mains are of unusual size, being from 20 to 36 inches in diameter. All city lines have been constructed in the most approved and substantial manner, with double joints, escape-pipe, and other patent appliances, which, with automatic regulators and cut-offs, reduce the chances of accident to a minimum.

*The company's plant now is:*

	Miles.	
Pipe lines owned in fee . . . . .	524.18	
Pipe lines operated under leases . . . . .	185.29	709.47
	Acres.	
Gas lands owned in fee . . . . .	881	
Gas and oil rights in fee . . . . .	2,194	
Gas and oil leases . . . . .	14,551	17,126
Gas and oil rights and leases of leased companies . . . . .	16,773	
Total gas territory controlled by Philadelphia Company . . . . .	33,899	
Number of producing wells . . . . .	200	
	Miles.	
Telephone lines owned in fee . . . . .	121.75	
Telephone lines leased . . . . .	65.50	187.25

*Consumers.*—On January 1, 1889, the Philadelphia Company were supplying 750 manufacturing establishments, including 38 iron and steel works, &c., and 23,080 houses. The quantity of gas required for this service approximates 500,000,000 cubic feet per day, which is equal to about 25,000 tons or 2500 carloads of coal displaced.

*Earnings and Expenses from October 1, 1885, to December 31, 1888.*

	Earnings.	Expenses.
1885 . . . . .	\$533,495	\$189,297
1886 . . . . .	1,635,886	579,743
1887 . . . . .	1,756,769	735,055
1888 . . . . .	2,624,159	741,653
Total . . . . .	\$6,450,309	\$2,245,748
All new wells . . . . .		225,657
Field pipe lines, station buildings, right of way and telephone lines . . . . .		207,000
Rents paid leased companies . . . . .		411,572
Total operating expenses, &c. . . . .		\$3,068,977
Net earnings . . . . .		3,380,331
Less dividends paid . . . . .		2,423,230
Surplus invested . . . . .		\$957,051

Since January 1, 1888, gross operating expenses include the total cost of all new wells, field lines, telephone lines and other items that might be charged to capital. Based on existing contracts, the estimated gross annual revenue now exceeds \$3,100,000, an increase of nearly \$600,000 over the gross revenue of 1888. Since November 20, 1885, the company have paid 40 consecutive monthly dividends of 1 per cent. each on the capital stock.

<i>Assets and Liabilities.</i>	
Available assets—Cash, bills receivable, &c.....	\$384,897
Unavailable—Real estate and plant.....	9,635,584
Total .....	\$10,520,481
<i>Liabilities.</i>	
Capital stock paid in.....	\$7,500,000
Accounts payable.....	111,738
Bills payable.....	1,971,833
Undivided profits.....	937,062
Total .....	\$10,520,481

The circular further points out that to duplicate the Philadelphia Company's system of mains and service lines—constructed under the most favorable circumstances and occupying the vantage ground at every point—and, at the same time, to acquire an amount of gas territory equal in value and extent to theirs, if not impossible would at least require double the capital they have invested. And as to the chance for increasing business, the circular states that adjacent to the company's mains in the cities and towns already piped there are more houses to use gas for fuel than the num-

ber of those already supplied. The reconstruction of mill furnaces on the regenerative principle now being made the condition of continued supply, the extensive introduction of gas-saving appliances and the sale of gas for domestic use by meter only is expected to do away with the waste that has heretofore existed, and so reduce the consumption of gas at least one-half. This saving, it is believed, will enable the company to furnish the houses still unsupplied and thereby greatly increase their revenue. By the employment of incandescent and other patent burners, the use of natural gas for illuminating promises a handsome income in the near future.

To take up the floating indebtedness of the company and provide for an extension of the main lines and distributing system as soon as desirable, the stockholders have authorized an issue of mortgage bonds to the amount of \$2,500,000, of which the company propose to place at present \$1,500,000. The mortgage provides for a payment annually of 10 per cent. of the amount of the bonds, less the accumulated interest on the sinking fund in the hands of the trustees, so that the bonds secured by the mortgage will be extinguished on November 30, 1898.

The increasing wealth of the United States is indicated by the importations of diamonds, an examination of the Custom-

### Electrically-Operated Drawbridge.

The usual method of operating a drawbridge is by means of a pinion mounted on a vertical shaft in bearings on the bridge and engaging with a circular rack secured to the top of the pier, power being supplied by two or three men working a long lever fitting on the vertical shaft, or by a steam engine through suitable gearing. The electric motor has now been brought forward to do this work, and during the past few weeks one has been most successfully operating the Bridgeport, Conn., draw. This bridge, which is 180 feet long, 60 feet wide and weighs 320 tons, was formerly turned by three men,

connected in series. The double switch 16, fuses, reversing switch 15 and rheostat 14 are inclosed in a water-tight box, 13, in the frame-work of the bridge, and are easily accessible from the road-bed. The bridge-tender has everything under complete control and can easily regulate the speed and the direction of rotation of the bridge. The motive power is furnished by a  $7\frac{1}{2}$  horse-power Thomson-Houston motor, 1, securely fastened to the draw by iron braces. On the end of the armature shaft, which revolves at the rate of 1500 turns a minute, is a pinion  $4\frac{1}{2}$  inches in diameter engaging with a gear 15 inches in diameter. The shaft of this gear carries a beveled pinion 5 inches in diameter engaging with one 15 inches in diameter mounted on a vertical shaft. Power is then transmitted through a train the five pinions of which are 7 inches in diameter and the five gears 14 inches in diameter, the faces of all being 4 inches. On the bottom of the last or slowest revolving shaft 8 is an 11-inch pinion, 4, which engages with the

Fig. 1.

### DRAWBRIDGE AT BRIDGEPORT, CONN., OPERATED BY ELECTRIC MOTOR.

but this method was found to be open to serious objection and attended by considerable expense, as it necessitated the constant attendance of the men, and under favorable circumstances the bridge could not be opened in less than six minutes, thus causing a jam on both sides and greatly impeding traffic. By means of the electric motor the draw can now be opened and closed in two minutes, and the expense is limited to the salary of one man and the charge of the electric light company supplying the current.

The current is conducted to the motor through two submarine cables, the core being equal to No. 4 B. & S. copper wire, which are protected from lightning by two Thomson-Houston lightning arresters. The shore ends are connected to the incandescent lighting current of the Bridgeport Electric Light Company by a double-pole switch, so that the current may be shut off at the pleasure of the draw-tender. The other ends are connected to vertical stationary posts 7, 8, which are carefully insulated from the structure, and which carry on their upper ends a pair of brushes, 9, 10, which are in contact with two insulated copper bands, 11, 12, attached to the drum of the bridge. A rheostat, 14, is used to regulate the speed of the motor and a reversing switch, 15, to change the direction of rotation of the armature. The armature, rheostat and fields are con-

ected in series. The double switch 16, fuses, reversing switch 15 and rheostat 14 are inclosed in a water-tight box, 13, in the frame-work of the bridge, and are easily accessible from the road-bed. The bridge-tender has everything under complete control and can easily regulate the speed and the direction of rotation of the bridge. The motive power is furnished by a  $7\frac{1}{2}$  horse-power Thomson-Houston motor, 1, securely fastened to the draw by iron braces. On the end of the armature shaft, which revolves at the rate of 1500 turns a minute, is a pinion  $4\frac{1}{2}$  inches in diameter engaging with a gear 15 inches in diameter. The shaft of this gear carries a beveled pinion 5 inches in diameter engaging with one 15 inches in diameter mounted on a vertical shaft. Power is then transmitted through a train the five pinions of which are 7 inches in diameter and the five gears 14 inches in diameter, the faces of all being 4 inches. On the bottom of the last or slowest revolving shaft 8 is an 11-inch pinion, 4, which engages with the

This installation was built by the New England Electric Supply Company, after designs by J. M. Orford, who has applied for patents upon the apparatus. The shafting and gearing were made at the Follansbee Machine Works, Bridgeport.

**The Strong Locomotive's Time.**—The official report of the recent trial of the Strong locomotive on the Erie Railway gives the following report of time made: "On the eastward trip, the Buffalo Division was covered in 155 minutes, the Susquehanna in 208 minutes, the Delaware in 159 minutes and the Eastern in 141 minutes. The times made up were respectively 8, 18, 21 and 13 minutes, or 60 minutes in all. The fastest mile noted was made in 55 seconds, and many were made in 60 seconds each. On the Delaware Division the distance from Callicoon to Hancock, 28 miles, was covered in 34 minutes, and from Hancock to Deposit, 13 miles, in 20 minutes, the grade being up. On

the Susquehanna Division the distance from Binghamton to Union,  $8\frac{1}{2}$  miles, was covered in 12 minutes; from Union to Owego,  $13\frac{1}{2}$  miles, in 17 minutes; from Owego to Waverly,  $19\frac{1}{2}$  miles, in 23 minutes; Waverly to Elmira,  $17\frac{1}{2}$  miles, in 22 minutes, and from Elmira to Corning,  $17\frac{1}{2}$  miles, in 25 minutes. On the Buffalo Division the distance from Hornellsville to Canaseraga,  $12\frac{1}{2}$  miles, was made in  $18\frac{1}{2}$  minutes; from Castile to Warsaw, 10 miles, in 15 minutes; Warsaw to Attica,  $17\frac{1}{2}$  miles, in 22 minutes."

The Dominion Government is being urged to build a railway bridge across the St. Lawrence at Quebec, to cost \$6,000,-

barges of 1000 tons each, to be built in New Haven, and go on the line between the New Jersey coal docks and Providence, R. I.

#### Norton Brothers' Can Factory.

One of the most remarkable aggregations of automatic machinery is assembled under the roof of Norton Brothers' can factory at Maywood, near Chicago. In the character of the work performed and the results accomplished it is claimed to be superior to anything else in the line of automatic machinery. Norton Brothers are manufacturers of tin cans of every description. They have manufactories at

is the machine-shop, in which all the machines and tools used by the firm are built. It contains an excellent equipment of planers, lathes, drills, &c. A novel feature about it is the tool-room, which is kept on an original plan which is worthy of general adoption. This room is connected by an electric system, similar to that used in hotels, with every part of the machine-shop and other portions of the factory in which tools are likely to be called for by the workmen. A hotel annunciator hangs in a conspicuous part of the tool-room. When a workman wants a tool he pushes a button near him and immediately a "bell-boy" runs to him from the tool-room with a slate and pencil, on which he writes his name and the tool desired. The numbers on the annunciator correspond with the numbers of the buttons, to fix the location of the summons. The boy hands the slate to the tool-room keeper, who has a list of the workmen's names, numbered according to the order in which they are placed on the list, but without reference to the number on the annunciator, which is an independent matter. A rack hangs conveniently near with a sufficient number of pins on it to hold small brass checks numbered to correspond with the workmen's numbers. Each pin holds a stock of several checks of the same number. The toolroom-keeper takes one of the checks of the man who sent for a tool, puts it in the tool-rack from which he takes the article wanted, charges the workman with it in a book kept for the purpose, and sends the boy back with the tool. The time of the workmen is thus saved, there is no confusion in the shop from men loitering to talk with others on their way to and from the tool-room, and a perfect record of the tools is always kept. When the tool is to be returned the boy is again called, the workman is credited with it on the books, and the check is restored to its place on the rack. This is an instance of the methods employed throughout the whole factory, care being taken in every respect to have operations conducted systematically, economically and with the least friction.

Entering the can-making department, a long row of machines is seen, which stretch with their connections from one side of the large building almost to the other. In these machines the tin plate is fed, cut into pieces of the proper size for can-bodies. It is drawn into tubular form over a mandrel, double seamed, and passed on into a carrier. The subsequent operations of heading, soldering, testing for leaks, drying, counting, and delivering either into the warehouse or the car for shipment proceed steadily onward without the intervention of a hand to direct any of the movements of the machinery or to perform any part of the manufacture. The disks for the heads are cut on a number of presses, with the dies so arranged as to cut out the greatest possible number from a sheet of tin plate. The dies are arranged in gangs, and cut out alternate disks at one operation and the intermediate disks at another, as their frame-work would not permit them to be set close enough to cut all out at once. From the largest spaces of tin plate left between the holes thus made a set of gang-dies cuts out can tops, and from the remnant still existing another set of gang-dies cuts out small disks for button covers to be sold to button manufacturers. Use has thus been made of the tin plate as far as possible in these works and the residue is sold for scrap to sash-weight manufacturers.

The caps for cans are already prepared with solder for the soldering iron when they are shipped to the canning factories. This solder is cut out of sheet solder in the form of a ring of the proper size and it is forced on the rim of the cap. It was found necessary to devise a special machine to do this in order to use the solder-

Fig. 2.

DIAGRAM SHOWING ELECTRICAL CONNECTIONS OF BRIDGEPORT DRAWBRIDGE.

000. Already there are two bridges, at Montreal and Lachine, which unite the Colonial system with the Western lines, and a bridge in progress at Coteau will give a third connection for an all-Canadian route between the Atlantic and Pacific.

The coal barge lines in the New York and Eastern trade are increasing their fleets by adding several vessels of the largest capacity adapted to the outside route. At Norwalk, Conn., six barges of about 1300 tons each are building for the New London Outside Towing Line, which is engaged principally in the bituminous trade with Virginia. The Boston Towboat Company is enlarging its scale of operations by building a large number of 2000-ton barges, regular sea-going vessels, provided with sufficient sails to be navigable even though the steam escort should be compelled to cut loose. The New England Transportation Company in like manner will during the season add four ocean

Chicago and at Maywood and are interested in similar establishments at San Francisco, New York and Hamilton, in Canada. Recently they purchased the property of the Abbott Iron Company at Baltimore, and propose to convert the buildings formerly used for rolling mills into a can factory to supply tin cans to the oyster and fruit canners of that part of the country. They own the special machines used in all these factories, which are the invention of Edwin Norton, whose genius in devising and perfecting automatic machinery places him in the foremost rank of those American inventors who have astonished the world with their achievements. The consumption of tin plate in these works is enormous, far exceeding that of any other works in any branch of manufacture in the world. A recent visit to their works at Maywood was full of interest.

Upon entering the factory, the first department into which the visitor is ushered

ing machine which Norton Bros. manufacture for canning factories. The solder being in place, it is easily fused and is in just the proper quantity. The edge of solder on the cap also preserves it from rusting if the caps and cans are carried over from one season to another, and thus avoids what might be, and often has been, a serious loss. The manufacture of sheet solder is carried on in this factory by an original method, which is in itself a revolution in metallurgical methods, and will be more fully described in an additional article. It is sufficient to say here that Edwin Norton has solved the problem of rolling molten metal directly into sheets, which has so long baffled the leading metallurgists of the world, from Sir Henry Bessemer down. For months in one corner of this factory a machine has been in successful operation, producing from molten solder beautifully rolled sheets from 6 to 8 inches wide,  $\frac{1}{16}$  inch thick, at the rate of 400 feet per minute.

A very large stock of tin plate is carried, and a special storehouse has been constructed for it, with every facility for making it a bonded warehouse in case the duty should be advanced as contemplated, when a much heavier quantity would at once be laid in, to be drawn upon as needed afterward.

An addition is just being built to this factory, which is 208 feet long by 137 feet wide, to be used for storage. This building is constructed of wood, with sheet-steel roofing and siding, to make it fire-proof externally. It is intended to hold 25,000,000 cans. It extends for its full length along the Chicago and Northwestern Railroad tracks, with doors placed at regular intervals of a car length apart, so that a number of cars can be loaded at the same time. In connection with the other buildings of the factory there is a frontage of 600 feet on the railroad, with doors arranged in this way for the whole distance. An elevated railroad runs from the car department through a covered passage to the new warehouse, and the cans roll along it by gravity to their destination, which is controlled by suitable switches, traveling over 1000 feet from their starting point. With such facilities it is not strange that a car can be loaded in an hour and a half and that over 100,000,000 cans can be shipped in a season from these works.

### Railroads in Europe.

The French Government has recently published the following statistics showing the length in kilometers of the railroads in Europe at the close of the year 1887 and the new construction during that year:

Country.	Length of the Railroads in Europe.		Per cent.
	Railroads end of 1887.	Additions to roads in 1887.	
	Kilo-meters.	Kilo-meters.	
Germany.....	39,570	1,221	3.18
Austria-Hungary.....	24,708	1,308	5.59
Belgium.....	4,702	168	3.71
Denmark.....	1,969	4	0.20
Spain.....	9,492	183	1.97
France.....	34,234	891	2.67
Great Britain.....	31,698	323	1.03
Greece.....	605	90	17.48
Italy.....	11,616	438	3.92
Netherlands and Luxembourg.....	2,952	94	3.29
Portugal.....	1,829	300	19.62
Roumania.....	2,351	412	21.25
Russia.....	28,518	820	2.96
Servia.....	517	73	16.44
Sweden and Norway.....	8,950	111	1.26
Turkey, Bulgaria and Roumania.....	1,394	.....	.....
Malta.....	11	.....	.....
Totals.....	207,939	6,471	3.21

This is equal to 129,210 miles, or far less than the railroad mileage of the United States.

A Cleveland, Ohio, paper says it looks very much as if \$4,000,000 or \$5,900,000 would be invested in new buildings in

that city this season. If the record for March could be taken for an average, the total for the year would be \$6,000,000 or \$7,000,000.

### Milling Tool Lathe Attachment.

The piston of the Crown water meter is made of vulcanized rubber, and in shape somewhat resembles a widely-spaced gear, as shown by the outlined white part of the

rubber is pressed into shape. Bolted to the shears of the lathe are the two blocks A, Fig. 6, each of which is formed with two bearings. This construction was adopted in order to increase the rigidity of the bar B, which, fitting in the bearings, is supported at four points. This is an essential feature, since, as the size of this bar is controlled by the opening in the mold through which it passes, it is necessarily limited thereby, and all spring-

Fig. 6.—Sectional Elevation of Bar Bearings.

### MILLING TOOL LATHE ATTACHMENT.

drawing, Fig. 2. This piston is made by pressure in a steel mold, which, in order to insure the perfect and easy working of the piston, which governs largely the accuracy of the meter, should be formed as nearly true as it is possible to make it. The tool herewith illustrated was designed by the inventor of the meter, L. H. Nash, solely for the purpose of attaining this object. It consists of few and easily-made parts—really only three—is easily adjusted on the lathe, and has been found to be most admirably adapted to milling the interior of pieces of such small size as to cramp the tool. The form of the mold and of the piston is given in Figs. 1 and 2, G representing the piston, F the mold and I J the dies between which the hard

ing of the tool must be prevented in order to insure accurate cutting. One end of this bar is bored to form a bearing for the driving shaft C, which is driven from the headstock. The milling cutter E is mounted on a transverse shaft located a little below the axis of the bar B, and is placed within an opening cut through the bar, as shown in Figs. 3 and 5. The end D of the driving shaft C is formed with four segments of what we may term volute curves, with which the teeth of the cutter E engage. It is now evident that as the shaft C is revolved it will turn the cutter E, the cutting edges of whose teeth are not subjected to wear, as only their rear edges come in contact with the edges of the driving curves. This forms a rigidly-

held and simply-driven cutter. The mold blank is passed over the bar and the feed parallel with the bar, to bring the lower or projecting edge of the cutter into action. The cutter shown in Fig. 5 is for cutting the deepest parts of the mold, two others, one for each angle, being needed to complete the work.

We are indebted to Mr. Nash and to the National Meter Company for the loan of drawings from which our cuts were prepared.

### Steam-Jet Chimney Draft Improver.

This machine is applicable whenever insufficient draft exists in chimneys which are too small for the purpose, or when the adjacent buildings are so high as to destroy the natural draft. It is constructed in accordance with the principle of the induced current, and while not decreasing the area, will create sufficient draft under all circumstances. The machine is composed of nozzles of gradually increasing area placed concentrically one above another. Entering the lowest and smallest nozzle is a steam-pipe leading from the boiler. The supply of steam is controlled by a valve

Steam Jet Chimney Draft-Improver.

located near the outside of the chimney. A slight opening of this valve is sufficient to induce a current of air through the side openings of the nozzles, which, multiplying as it ascends, produces a powerful suction at the base of the chimney, with very small consumption of steam. It is stated that these machines, which are being introduced by Amos Aller, 109 Liberty street, New York, have proved very successful wherever used.

Now that the Sandwich Islands have passed from the control of a puppet king into the hands of foreigners—mostly Americans and English—San Francisco papers suggest a movement on the part of the United States directed to the occupation of the strategic points, rather than await a threatened invasion by some other power. The Hawaiian group is becoming an important center of production and commerce. The sugar crop this year is reckoned at 130,000 tons—nearly twice as much as the Louisiana crop. Of rice the islands yield some 10,000,000 pounds annually, and the product of fruit and hides is large. Coffee has not yet been a success on the islands, but that will come. This fine territory, we are reminded, is "absolutely in search of an owner."

Japan has 2000 miles of railroads, 10,000 miles of telegraph wires and 30,000 schools, besides the Imperial University at Tokio.

## Legal Decisions.

### PROMISSORY NOTE—COMPOSITION WITH CREDITORS—NOTE FOR BALANCE OF DEBT.

A. made a composition agreement with his creditors, but he was induced by T., one of them, to give him a note for the balance of his debt. This note was not paid, and an action was brought upon it, to which H. set up the defense that it had been given without consideration, and he defeated T., who carried the case—*Tinker vs. Hurst*—to the Supreme Court of Michigan, where the judgment was affirmed. The Chief Justice, Sherwood, in the opinion, said: "It is very clear that the plaintiff should not recover in this case. All of the creditors by the composition agreement materially contracted with each other that the defendant should be discharged from their debts after the execution of the deed, and therefore any agreement between the debtor and any one of the creditors which gave the latter any special advantage is in fraud of the other creditors, and it cannot be enforced."

### MARINE INSURANCE—PERILS OF THE SEA—EXPLOSION OF BOILER.

M. insured his steamboat Pilot against marine risks, and after its loss by reason of an explosion of its boiler he sued upon the policy. In the complaint the loss was alleged to have resulted from the explosion of the boiler, as the vessel sunk by reason of its having become unmanageable therefrom, and the company in reply alleged that it was not liable for an injury happening from an explosion. The contention of the company was sustained by the court below, and the case—*Miller vs. California Insurance Company*—was carried to the Supreme Court of California, where the judgment was affirmed. Judge Patterson, in the opinion, said: "Perils of the sea are defined by our code to be 'storms and waves; rocks, shoals and rapids; other obstacles, though of human origin; changes of climate; the confinement necessary at sea; animals peculiar to the sea, and all other damages peculiar to the sea.' The bursting of a boiler is not within any of the six causes named. Is it a danger peculiar to the sea? The same thing would have happened had the boiler and engines been on land had the same mismanagement taken place. The sea, waves and wind had nothing to do with it. It is impossible to say that this is a damage occasioned by a cause similar to perils of the sea on any interpretation which has ever been applied to that term."

### PLEDGE—ACCOMMODATION NOTE—SALE OF PLEDGE.

A., B. and C. executed a note to H. for \$25,000 for his accommodation, and secured it by a pledge of their property. H. borrowed of S. \$15,000 on the note and security, and on default S. sold the pledge and bought it for \$15,000, and he then brought suit to foreclose the equity of redemption, claiming as the debt due him the face of the note, \$25,000, and he had judgment. The case—*Handy vs. Sibley*—was taken to the Supreme Court of Ohio, where the judgment was reversed. Judge Dickman in his opinion said: "A pledgee cannot, by a sale and purchase by himself of an accommodation note and mortgage under a special power of sale and purchase from the pledgor, recover upon foreclosure of the equity of redemption more than the sum advanced by him."

### FRAUDULENT SALES—DECLARATIONS OF VENDOR MADE BEFORE AND AFTER THE SALE.

E. was a merchant in the hardware business and he became embarrassed, and two of his creditors—R., to whom he owed \$960, and L., to whom he owed \$1300—insisted upon payment, and as he could

not pay he sold his stock of goods to their attorney-at-law in payment of their demands, who took possession of the stock and store, excluding E. therefrom. The signs of E. were taken down. A few days later H., a judgment creditor of E., seized the goods in the store in execution, and R. and L. sued in replevin to recover the property as belonging to them. On the trial of the case—*Rogers vs. Thurston, sheriff*—E. was a witness for the defendant, and he was permitted, against objection, to testify to the facts: 1. That he had delivered the property to R. and L.'s attorney on the express understanding that he was to still have them to sell until H.'s judgment was paid. 2. That he had informed H. about two weeks before the sale that the goods were worth about \$3000. On this testimony the defendant had judgment, on the ground that the sale was fraudulent as to him, and an appeal was taken to the Supreme Court of Nebraska, where a reversal was had. Judge Maxwell in the opinion said: "The testimony of E. was not admissible; his declarations could not bind the plaintiffs unless there was a conspiracy between them and E. to defraud his creditors by the sale. If there was such a combination, there should have been distinct proof of that fact made before the declarations were admitted. Here there was no attempt even to prove any conspiracy. As to the value of admissions arising out of a conspirator, a leading jurist says: 'Such evidence courts have found to be quite unreliable. It is not uncommon for different witnesses as to the same conversation to give precisely opposite accounts of it, and in instances it will appear that the witness deposes as to the statements of one party as coming from the other.' A substantial rule of evidence compels the reversal of this case. No admissions by a vendor made after he has parted with his title and not connected with the transaction are admissible against his vendee. As to the valuation made by E. before the sale, that simply tended to show that the sale was fraudulent, and such a fact could not be established in that way; some conspiracy, as we have said, must first be made out."

Western millers have been so long shut out from the British market by high prices in the United States that they are fearful of losing the export trade altogether. To learn the prospects numerous inquiries were addressed to correspondents in England, from whom replies have been received agreeing in all the main particulars. The general conclusion reached is that at the present time Great Britain is almost wholly independent of American supplies. Not only has the British product improved in quality, but Hungarian brands so closely resemble the best Minnesota products that the two qualities are scarcely distinguishable. Hungarian flour, therefore, is a formidable rival. Prices have undergone no material change. With reference to trade prospects the present condition is regarded as temporary, correspondents abroad being of the opinion that with a return of abundant crops and prices on an export level the American trade would speedily revive. Even at the present time if prices were satisfactory there would probably be quite a demand for American flour.

Compressible canvas boats, occupying only about 2 feet of space when folded, although capable of carrying 100 men, are being introduced on some of the Cunard steamships. In a trial at Boston 91 men were hurried into one of these boats with safety and rowed about the ship, giving the impression that they will be a valuable part of the ship's equipment.

### The Protection of Blast Furnace Shells.

Samuel McClure and C. F. Phillips, of Sharon, Pa., have devised a method for protecting furnaces and like structures. The invention consists, first, in providing a brick structure—such as a furnace or stack—with a non-conducting water space filled with gravel or other coarse substance; further, in the peculiar arrangement of devices for supplying water to the whole or to any part of the water space; further, to a system of "observation boxes" located in the wall of the structure, by means of which the condition of the water space and furnace lining may be observed.

Fig. 1 represents a vertical section through the wall or lining of a blast furnace. Fig. 2 is a similar section, illustrating a modification. Fig. 3 is a horizontal section on the line *xx* of Fig. 1. A is the lining of the furnace, and B the external iron jacket surrounding it. C represents a space in the lining, which extends from the mantle D to the top of the furnace. This space may be formed as in Fig. 1, where an external course of brick is interposed between it and the jacket B, or as in Fig. 2, where the space is formed between the jacket and the brick-work directly. The entire space is filled with coarse gravel or some similar material, which of itself forms a non-conducting agent. This non-conducting space is supplied with water in whole or in any portion by the following system of water distribution:

E represents a water-pipe constructed in sections *b*, Fig. 3. This pipe is imbedded in the gravel filling the water space at a suitable height and extends horizontally throughout its entire circumference. The ends of the sections are closed and each one is provided with a number of perforations through which the water is admitted to the gravel filling, down which it percolates, thoroughly moistening it below each section of pipe. The sections *b* may be supplied with water from a circular pipe, F, surrounding the furnace and having a branch pipe, *f*, with a suitable valve, *f'*, communicating with each of said sections. A vertical pipe, G, communicates with the pipe F and with a tube, H, connected to any supply of water under pressure. Preferably, however, the pipe F is dispensed with, and each section *b* is supplied by means of a separate vertical pipe, like the pipe G, connected directly to the section and to the tube H and having a suitable cut-off valve. The tube H also surrounds the furnace and is supported by the bracket I. The tube is preferably made as shown in Figs. 1 and 2, with an open trough, J, into which the discharge-pipe K carries any excess of water from the space C, and which should communicate with a suitable drain. The tube and trough are built of iron sections bolted together as shown at *i*, Fig. 1, but may be formed in any other way that may be found desirable.

It will be evident from the description that water can be supplied to any or all of the sections *b* of the inner water-pipe, and thus that any portion of the entire circumference of the graveled space may be thoroughly moistened at will; also that the water may be shut off entirely and such space used as a dry non-conductor.

In order that the condition of the furnace lining and water space may be accurately observed, a series of observation boxes, L, are provided. These boxes are cast of any desired size—say from 4 to 6 inches in diameter—and are preferably square in cross-section. They are cast with a flange at their outer end, by means of which they are bolted to and within the iron furnace jacket, as shown at *l'*, Fig. 1. Their inner end extends a sufficient distance into the brick lining, and,

like the outer end, is open, so that the condition of the lining can be seen. Each box is provided with a slot which registers with the water space, and which while allowing the amount of moisture in the gravel to be ascertained, also permits of evaporation when from any cause it occurs.

tion with the two adjacent boxes in the next tiers above and below. These boxes may be made accessible by platforms at the different tiers or in various other ways.

The device has been applied to the two furnaces of the Stewart Iron Company, at

Fig. 1.

Fig. 2.

Fig. 3.

#### PROTECTION OF BLAST FURNACE SHELLS.

These boxes are placed around the entire furnace in tiers, the tiers being, say, 3 feet apart, and the boxes in each tier about a similar distance from one another. The tiers may be carried up to the top of the furnace, if thought desirable, or to any height below that, and the boxes in each tier are arranged so as to alternate in posi-

Sharon, Pa.; No. 1, which is 66 feet by 12 feet 8 inches, having been in blast 20 weeks, and No. 2, 70 feet by 13 feet 8 inches, 50 weeks. In both furnaces the space for the gravel is between the 4½-inch casing and the regular lining brick. In No. 2 furnace, the one longest in blast, the observation holes extended to within

13½ inches of the inside face of the well, and to date no appearance of wear is indicated in them. In No. 1 furnace they extended through the lining to within 9 inches of the inside of the face, as shown in our drawings. This 9 inches has not yet been worn away. The device has worked to the entire satisfaction of the Stewart Iron Company, and seems destined to be widely accepted by blast furnace managers.

## THE WEEK.

It is remarked that while New York City is able to dispose readily of \$7,500,000 of bonds at rates paying the investors only 2½ per cent. per annum, the Canadian Government congratulates itself on borrowing \$20,000,000 on terms equivalent to 4½ per cent. There is a difference either in credit or skill in financiering.

The late Isaiah V. Williamson, of Philadelphia, whose munificent endowment of a technical and trade school to be founded in that city will be a permanent memorial, gave during his lifetime \$4,000,000 to philanthropic objects. Outside and beyond the \$2,000,000 given for the building and support of the mechanical school just referred to, the appraisal of personal estate shows an aggregate of nearly \$10,000,000 in stocks, bonds and other securities. The largest single item in the list is the holding of Cambria Iron Company stock amounting to \$606,528. With a cash balance of \$23,488.45 in bank, Mr. Williamson's wearing apparel and strictly personal effects were too insignificant to be given a value.

A discovery of much archæological interest has recently been made near the small town of Painted Cave, Tex. Laborers came upon a graveyard containing Indian and Aztec remains, arrows, battle axes, &c., and a score or two of the peculiar weapon of the Azatlan race were found. This weapon is a short metal axe, with blades of glass. The metal is supposed to be copper, but the specimens just found are so tarnished and incrustured by age and burial that this point has not yet been fully determined. A quantity of Aztec currency, consisting of bits of tin in shape like the letter T, was gathered from among the skeletons.

A Russian firm has obtained from the Italian Government the privilege of erecting petroleum tanks at Leghorn and other Italian ports, and has obtained from the United States machinery for the manufacture of tin cans and cases on the spot. The United States Consul advises that American manufacturers should adopt the same course.

The new Supervising Architect of the Treasury Department is J. H. Windrim, whose duties include the disbursement of large sums of money and the direction of numerous subordinates. He must possess exceptional abilities in the treatment and choice of architectural designs.

An automatic fire sprinkler in the establishment of Koch & Sons, manufacturing stationers, in this city, which was designed to operate only in case the soldering was melted, "went off" without provocation and did \$35,000 damage.

The bankers in New York who were receiving subscriptions to the stock of the American Meat Company (the dressed-beef trust) have withdrawn from the scheme and the subscriptions will be returned. It is understood that the Armour syndicate, which is a large customer of the Cotton-Oil Trust, brought pressure to prevent the threatened conflict of interests. J. H. Flagler, president of the Cotton-Oil Trust, and J. O. Moss, its treasurer, were

president and vice-president of the new meat company, but resigned. The new concern was to control 20,000,000 acres of ranch land, and was backed by important interests.

The completion of the new railroad bridge over the Ohio River at Cincinnati signals the commencement of a new system of traffic by the Baltimore and Ohio Railroad through their Western connections which is expected to build up a large business between the seaboard and the interior.

It is said that the Pennsylvania Railroad now has a controlling interest in three transatlantic lines of steamers, and as they have to make their regular trips the Pennsylvania can charge the regular export rates and then make the steamship companies carry the freight at a loss if necessary. Besides the Pennsylvania, the Grand Trunk has a contract to furnish a certain amount of freight to the Allan Line. It is problematic how the interstate law can reach these particular cases.

Judge Thayer, of the United States District Court at St. Louis, decides that a package of newspapers put on the top of a letter-box is no more in the custody of the Post-office Department than if put on the post-office steps, and that taking the package away is no offense against the law.

Robert Garrett and others, of Baltimore, propose to establish a sugar refinery in that city, and one-half of the \$1,000,000 capital required has already been found.

The New York Subway Commissioners ask the Legislature for an enlargement of their power, or rather the appointment of a new commission, to include the Mayor and other members of the municipal Government. They want to devise some plan which will prevent explosions, the improper tearing up of the streets by the gas and steam-pipe companies, and the leakage from the gas and steam-pipes so far as is possible.

Henry C. Squire's sporting establishment on Broadway was damaged nearly \$50,000 by flames that broke out in the engine-room. The explosion of gas from a broken fixture was among the destructive agencies.

It is reported that the Philadelphia Company has struck near Belle Vernon, 26 miles from Pittsburgh, one of the largest natural gas wells ever opened by a drill.

The annual meeting of the National Academy of Sciences was opened on the 16th inst. at Washington. It is probable that during its session a national society of geologists will be organized.

The British budget shows a diversity of nearly £2,000,000, the estimated values for the current year being placed at £85,000,000, while the expenditures will foot up to nearly £87,000,000, caused by increased army and navy expenses.

It is charged that the threatened strike against the insurance system of the Baltimore and Ohio by its employees is being fomented by agents of life insurance companies.

The condition of affairs along the Panama Canal is described as pitiful. A large number of men are out of work and are approaching starvation. Expensive machinery, being exposed to the weather, is deteriorating considerably.

The reports of the earnings of the railroads upon close study are not shown to be satisfactory. The *Financial Chronicle* reports that for the first three months of this year roads with a mileage of 71,312 miles had gross earnings of \$82,000,000, or \$1151 per mile, against \$76,000,000 on

68,205 miles for the same quarter of last year, or \$1112 per mile. Considering the great strikes and the unprecedented storms last year, these returns do not represent an increase in the volume of general business in proportion to the increase in mileage, even if rates were not changed at all.

It is stated that two independent sugar refineries at Philadelphia are selling their product at 6½ cents, as compared with 7 cents for granulated, which is the price of the trust refineries. In spite of the fact that the independent refiners are paying ½ cent more for raw sugar, they are reported to be making good profits.

If the plans now before Parliament are carried out England will during the next few years spend £21,500,000 upon her navy. It appears from this that England expects not only to maintain her present naval superiority, but to keep in advance of some of her neighbors who are devoting attention to war vessels.

The successful placing of bonds for the city of New York at 2½ per cent. is giving rise to considerable comment. It is stated that it is an intimation of the fact that the interest rate on safe investments is now rather below 3 per cent. per annum, 4 per cent. mortgages being hardly available in satisfactory quantities for institutions needing such collateral.

A comparison between the English ship *Calliope* and the Trenton shows the following figures: The former had 3000 horse-power engines and 2700 tons displacement. The latter had 3100 horse-power, but her tonnage was 3900.

Dr. Wendell Prime, Prof. Theo. Wight, Dr. Howard Crosby and Geo. W. Cable addressed the New York Prison Association lately, indorsing the Fassett bill.

At the St. Louis Exposition, to be held this fall, there will be a large and comprehensive exhibition of electrical appliances. The managers have offered every inducement to manufacturers of electric apparatus and expect each branch of the science to be fully represented. There will also be provided a large hall in which exhibitors can demonstrate the operation of their appliances.

In his message to the Mexican Congress, President Diaz states that contracts now in force promise an investment in mining enterprises of more than \$40,000,000. He states that the cultivation of the vine and the breeding of the silk-worm are progressing; that the telegraph system has been developed rapidly until the total length is now 21,200 kilometers. Financially, the position of the country is growing stronger, and with continued peace a prosperous future lies before Mexico.

Congress has appropriated \$400,000 for the construction of seven dynamite guns. According to Captain Zalinski, three of these will be placed at Sandy Hook, two at Fort Schuyler and two at Fort Wadsworth.

A very large jute factory is to be built by Platt, who is connected with the Standard Oil Company, on property adjoining the refinery on Newtown Creek, Greenpoint, L. I.

Experiments made by Leutz indicated that the use of aluminium for castings when gray iron was used was often positively detrimental. Its effect upon white iron was favorable, but care must be taken to strike the right temperature, which must be low. At the proper heat no iridescence is shown on the surface of the iron, which has a greenish tinge.

The product of all the furnaces in the Upper Susquehanna Valley, Pa., in March aggregated 16,184 gross tons.

## MANUFACTURING.

### Iron and Steel.

The newly-organized Steubenville Iron and Steel Company, located at Alikanna, 3 miles from Steubenville, Ohio, made their first muck iron on the afternoon of the 9th inst. Twelve new puddling furnaces are completed, making 25 in all. The company own about 140 acres of coal property, and as soon as the pumping out of the mine is finished it will be operated.

Gabel, Jones & Gabel, lessees of the Norway Furnace, at Pottstown, Pa., have recently struck a blue vein of iron ore of very excellent quality at Boyertown. Work on the new and second shaft which has resulted in this find was started in August, 1886. Black ore was struck in June of 1888 at a depth of 638 feet. The blue vein was struck on Thursday, the 4th inst., in a gangway driven out from the shaft proper to an estimated length of 320 feet, of which the actual length is 317 feet. This new vein is regarded as a good quality of ore and is the larger of the two. The total depth of the new shaft is 658 feet.

During the month of March, Rosena, a furnace at New Castle, Pa., made 5875 tons of No. 1 foundry pig iron, which amount is said to be 58 tons more than has ever been made in one month by any furnace in either the Shenango or Mahoning valleys.

A press dispatch from Chambersburg, Pa., under date of the 11th inst., says: "The Falling Spring Furnace here, which has been idle for five years, has been purchased by C. Burkhart & Co., who will put it in blast about July 1. The furnace of the Mont Alto Iron Company has also been put in blast."

Sarah Furnace, at Ironton, Ohio, made 303 tons of foundry pig iron week before last. This is the largest output for one week in the history of the furnace.

From a recent issue of the Ironton, Ohio, *Register* we take the following: "Messrs. Warner, the coke men, and Moore, the Bath County ore man, are in town trying to negotiate for the lease of big Etna furnace. We understand that there is a probability of a lease being made. Sarah Furnace is also included as a part of the lease."

With the exception of the tack factory all the departments of the La Belle Iron Works, at Wheeling, W. Va., closed down on Wednesday, the 10th inst., for an indefinite period.

The iron building department of the Shiffler Bridge Works, of Pittsburgh, Pa., J. W. Walker, proprietor, has recently completed for the Jefferson Iron Works, Steubenville, Ohio, an extension to their cast house, and has now on hand an extension to the cast house of Shoenberger, Speer & Company, of Pittsburgh.

The new furnace of the Jefferson Iron Works, at Steubenville, Ohio, was blown in on Tuesday, the 9th inst. It is 17 feet at the bosh and 81 feet in height and was erected by J. P. Witherow, engineer and contractor, of Pittsburgh. It was built to replace an old stack and has a capacity of about 150 tons per day.

The entire plant of the Penn Iron Company, Limited, at Lancaster, Pa., has been closed down for an indefinite period, on account of the iron market.

Notwithstanding reports to the contrary, the rail mill of the Allegheny Bessemer Steel Company, at Duquesne, is only being operated single turn. The rail-straighteners and others in the finishing department went on a strike several weeks

ago, refusing to accept the scale of wages offered by the firm. New men have been engaged, but not a sufficient number as yet to operate the plant more than single turn. The following agreement is presented to each employee for signature before entering into the firm's employ: "I do hereby pledge and bind myself, on my word of honor, not to join any labor organization while in the employ of this company, and also to give two weeks' notice to the company before leaving."

The Pennsylvania Tube Works, of Pittsburgh, have received an order from the Standard Oil Company for 100 miles of 8-inch pipe.

The Otis Iron and Steel Company, of Cleveland, Ohio, are erecting a forge 30 x 60 feet, which will contain eight hammers.

We are informed that the report that Cartwright, McCurdy & Co., of Youngstown, Ohio, were about to lease and put in operation the Himrod Furnace at that place is without foundation.

Carnegie Brothers & Co., Limited, of the Edgar Thomson Steel Works, at Braddock, Pa., are considering the question of erecting an additional blast furnace at that place, to cost in the neighborhood of \$200,000. Furnaces A and Y will shortly be blown out for extensive improvements. A new converter and other appliances that are to be put in this summer will considerably increase the output and cause a demand for more iron. This will make the erection of another furnace a necessity. At present the firm are operating seven blast furnaces at Braddock, six of which are running on Bessemer and the other on spiegel.

The Brooke Iron Company, of Birdsboro, Pa., have resumed work in their nail factory.

At a meeting of the stockholders of the Charlotte Iron Works Company, at Rochester, N. Y., a proposal was made to establish cast-iron pipe works. Although the project has been regarded favorably, no definite action was taken in the matter pending another meeting, which is soon to be held. The following officers were elected for the coming year: President, George B. Smith; vice-president, A. G. Yates; secretary and treasurer, A. S. Clarke.

The Plymouth Rolling Mill, of Conshohocken, Pa., have made an assignment to A. A. Lindsey, of the same place.

The Swindell & Smythe Company, Lewis Block, Pittsburgh, Pa., have just completed the following contracts: At the Kansas City Bolt and Nut Company, Kansas City, Mo., they put in an 18 x 7 feet regenerative gas mill heating furnace and artificial gas-producing plant, the capacity of furnace being more than sufficient to keep a 10-inch train running continuously, the gas being made from the commonest slack coal. For the McConway & Torley Company, Pittsburgh, they built six annealing furnaces, 8 feet 6 inches wide, and an open-hearth melting furnace for foundry purposes, which are running with natural gas; they also built a large regenerative gas open-hearth melting furnace and artificial gas-producing plant for the Lobdell Car-Wheel Company, Wilmington, Del., which is used for making car-wheels and heavy castings. The regenerative gas-annealing furnaces they have put up for Henry Disston & Sons, Philadelphia, Pa. (for which they have applied for a patent) are doing good work. They are annealing the plates, so that they are able to dispense with the die furnaces altogether. Both sides of the saw-plates are annealed at the same time by their improved arrangement. They have remodeled the pipe mill for the Riverside Iron Works, Wheel-

ing, West Va., putting in their gas-producers to take place of natural gas, which was used formerly in this mill, and have also built for them one large lap-welding furnace, and one lap-weld bending furnace. For the Kelly & Jones Company, Greensburg, Pa., they built the entire brass melting plant, both open-hearth and crucible melting furnaces being used. The plant of Benjamin Atha & Co., Newark, N. J., has been entirely remodeled by them, their gas-producing apparatus being adopted throughout. They also built the 30-pot crucible steel melting furnaces, and a large mill heating furnace, which takes the place of five small ones, which were used previously. For the Addyston Pipe and Steel Company, Cincinnati, Ohio, they set three batteries of boilers and applied artificial gas to some of them. They also built the entire plant for John Illingworth & Co., Newark, N. J., consisting of 30-pot crucible steel melting furnaces, a gas-producing plant and several large and small mill heating furnaces. For the Johnson Foundry Company, Johnstown, Pa., they have put in a 15-ton air melting furnace, for making rolls, &c. The following plants they have closed contracts for are in the course of construction: For the Columbia Iron and Steel Company, Uniontown, Pa., they are building a 10-ton open-hearth steel melting furnace, and for the Montreal Rolling Mill Company, Montreal, Canada, they are making additions to their mill, by putting in additional gas-producing plant and two improved mill heating furnaces, and they have contracted with the Ramel-Conley Iron and Steel Company, Brewsters, N. Y., to put in for them a complete steel plant, consisting of open-hearth steel furnaces, artificial gas-producing plants, ladles, casting pits, cranes, cars and everything complete, ready to put the plant in operation.

### Machinery.

The firm of McGill, Manchester & Co., general machinery manufacturers, at Pittsburgh, have been dissolved, and all the property and effects of the company have been assigned to J. J. McGill and Chas. E. Salter, who have reorganized under the firm name of McGill & Co., and will continue the business at the old location on Smallman street, in that city.

The Westinghouse Electric Company, of Pittsburgh, have just issued, in pamphlet form, a full list of patents controlled by that corporation.

Mackintosh, Hemphill & Co., proprietors of the Fort Pitt Foundry, at Pittsburgh, have already commenced to rebuild that portion of their works which was destroyed by fire on the 27th ult.

While pouring a heat to make a 4000-pound casting in the foundry of William Tod & Co., at Youngstown, Ohio, on the 11th inst., it exploded, hurling the molten metal in every direction. A number of the workmen were seriously injured, but no lives were lost.

The Springfield Iron Works, Springfield, Mass., have recently added new machinery and greatly increased the capacity of their forging department.

E. E. Garvin & Co., Lighthouse and Canal streets, this city, have extended an invitation to those interested to inspect their new factory on April 30.

Messrs. D. H. and F. M. Merritt, of Marquette, have completed with the West Duluth Land Company an arrangement for the removal to Duluth of the Iron Bay Mfg. Company, now located at Marquette, Mich. The works make Corliss engines, mining machinery, hoisting engines, general foundry castings and boilers of all styles, marine and stationary. They have been in business there many years and have worked up a trade with the Michigan iron

ranges, the Gogebic and the Vermillion, and the silver and copper mines of Montana, besides a very large general business. The company will have a paid-in capital of \$300,000. The West Duluth Land Company have agreed to raise \$90,000, to be paid in when the enterprise is moved. The business of the concern will be managed by D. H. Merritt, who is made president and treasurer, and Frank Wilbur Merritt, secretary and general manager; C. Markell, vice-president. Directors are as follows: D. H. Merritt, F. M. Merritt, Capt. Jos. Sellwood, O. H. Simonds, C. Markell. There will be seven distinct buildings, besides oil-house, fire-cistern, engine-house and stack. All will be of brick and all but the machine shop and pattern-house will be one story high. The machine shop will be two stories, with one end raised to three for office and other purposes. It will be 60 x 275 in ground plan, with an office at the end fronting on Fourth avenue east 20 feet deep, making the entire side length of the building 295 feet. Built up close to this, and at right angles with it, will be a structure 260 feet long and 60 feet wide, the first 60 x 60 feet of which will be a blacksmith shop, while the remaining 200 x 60 feet, stretching along Fourth avenue east, will be a general foundry. Close behind this will be a pattern shop, 40 x 60 feet, and a coal and sand house, also 40 x 60. Across a clear space and near the east end of the long machine shop will be the boiler shop, also 60 feet wide and 150 feet long. Further down toward the slip will be a two-story pattern-house, practically fire-proof and 60 x 100 feet, and a general storehouse, 40 x 85 feet. Built up against the machine shop will be two buildings, each 30 x 40 feet, in one of which will be located the engines and boilers of the establishment.

#### Hardware.

Excelsior Mfg. Company, Birmingham, Conn., makers of edge tools, will soon erect a new factory at Shelton, Conn. The new structure will be of brick, 280 x 40 feet and three stories high.

Champion Blower and Forge Company, of Lancaster, Pa., are meeting with an excellent demand for their Champion self-feed upright blacksmith post drill. A representative from *The Iron Age* visited their place of business a few days ago, and from the daily mail just received was shown letters containing orders from New York, Pennsylvania, Ohio, Indiana, Michigan, Illinois and Texas.

The Ludlow-Saylor Wire Company, St. Louis, Mo., have furnished the ornamental artistic metal-work for the Exchange Bank, Franklin, Pa.

The Sequatchee Hoe and Tool Company, South Pittsburg, Tenn., have contracted for such additional machinery as they will need for the manufacture of shovels.

C. E. Hudson, Leominster, Mass., has been putting in special automatic machinery for the manufacture of apple parers, and otherwise increasing his facilities for turning out better work and cheaper than ever before.

W. G. Avery, president of the W. G. Avery Mfg. Company, Cleveland, Ohio, has received notice from the Commissioner of Patents for Canada that a Canadian patent was issued to him April 2 covering elevator buckets, welded, brazed and fused.

The strike at the Ames Shovel Works, of North Easton, Mass., which lasted seven weeks, has been settled.

#### Miscellaneous.

The Savage Fire-Brick Company, of Pittsburgh, who have for six months been shipping large quantities of brick to Birmingham, Bessemer and other Alabama points, have just secured a contract from

a new furnace company at Sheffield for 2,500,000 bricks. These will cost \$50,000 at the manufactory.

The Chas. Munson Belting Company, of Pittsburgh, have received an order at their Chicago branch house from the Minnesota Brush Electric Light Company, at Minneapolis, for 140 feet 68-inch, 60 feet 86-inch and 70 feet 80-inch leather belting. The 68-inch belt, it is claimed, is the largest leather belt made in this country.

A press dispatch from Findlay, Ohio, under date of the 12th inst., says: "Two enormous gas wells were struck here today, one with a capacity of over 80,000,000 cubic feet and the other with not less than 20,000,000 feet. The former is owned by the city.

Reports from South Pittsburg, Tenn., are to the effect that the different manufacturing concerns there are taxed to their utmost to fill orders, and the city is regarded as growing on a firm basis. Electric lights are being put in, an additional pump is being added to the water-works, and other enterprises are progressing.

Randolph & Clowes, who began business about two and a half years ago in a portion of the old mill of the late firm of Brown & Bras., Waterbury, Conn., have recently purchased the remainder of the plant, consisting of a number of buildings, covering nearly 8 acres. This acquisition will more than double the capacity of Randolph & Clowes, and will be used to extend the production of seamless drawn brass and copper tubes and patent seamless drawn copper house boilers, and for the rolling of brass and copper for all purposes. The recently purchased buildings are almost bare of machinery, most of the old equipment having been sold some time since, so that Randolph & Clowes will have an opportunity of putting in the latest improved machinery and appliances, which they purpose to do. At present there are in their works several hydraulic machines of great capacity, operated by a great pump and an accumulator, weighing 70 tons, and costing from \$10,000 to \$25,000 each. The new portion of the plant will be in running order in a few months.

The Canton Steel Roofing Company, Canton, Ohio, are now doing business and completely settled in their new plant, which is referred to as exceptionally complete. They report an increase of business during the first quarter of the year of more than 30 per cent. over last year.

Among new corporations recently authorized in the State of Illinois are the following: Sampson Steam Forge Company, Chicago; capital, \$100,000; for the manufacture of locomotive frames and general forging; incorporators, S. R. Wilson, F. J. Smith, J. W. White and F. J. Wilson. The Chicago and Minnesota Ore Company, Chicago; capital, \$2,000,000; for mining, transporting, reducing and refining iron and other ores, dealing in securities, corporations, and other personal property; incorporators, Charles P. Coffin, Austin W. Grenville and Arthur C. Elis.

The National Tube Works Company, McKeesport, Pa., report that they have sold over \$8,000,000 worth of their kalamined pipe since the patents were issued. This pipe is used for a variety of purposes, principally water, oil and gas. There are 5900 men at present in the employ of the above company, and their works comprise 60 acres under cover. The daily output is 1000 tons of finished product, including standard steam, gas and water pipe, boiler tubes, &c.

Evans & Howard, St. Louis, Mo., favor us with a recently-issued catalogue of fire-brick, gas retorts, &c., St. Louis standard

sewer-pipe, &c., which they manufacture. In an introductory note to the trade they direct special attention to their 9-inch brick cupola blocks, tiles and shapes, of which they keep a large stock on hand. They own their bed of fire-clay and have exceptional facilities for distributing their product by rail. They also refer to their two large factories for the production of sewer and culvert pipe. In addition to the goods mentioned the catalogue illustrates cost prices of furnace linings, paving brick, drain tiles, well tubing, chimney-flue pipe, &c.

The Johnstown Steel and Iron Casting Company, of Johnstown, Pa., manufacturers of steam and hot-water radiators, have been in existence for about two years. The company is composed entirely of business and professional men who cannot give the business the necessary attention, and they have decided to lease the plant with the full equipment. It is located at Sheridan Station, on the line of the Pennsylvania Railroad, and is said to be in good condition in every respect.

#### Brazilian Trade.

The anomalous condition of American trade with Brazil is the subject of discussion in Rio papers, with the object of showing that while Brazilian products as a rule are admitted into the United States either free or at a low rate of duty, the Brazilian Government makes no corresponding concessions. The *Rio News* says: "While the United States has voluntarily abolished all duties on coffee, rubber, hides and horns and many medicinal plants, all products of Brazil, and is even considering the question of reducing or abolishing duties on sugar—another Brazilian product—here in Brazil the duties on American products have been rigidly maintained, in some cases at an unjustly high figure. And while the United States takes over half the coffee produced in Brazil, considerably over half of the rubber product, fully half of the hides and horns exported, and about two-fifths of the sugar crop—or, in the aggregate, about one-half of the entire exports of the country—the imports from the United States into Brazil barely reach one-seventh of the total importation. This certainly is not an indication of reciprocity in trade, nor of an overpowering sentiment of friendship and neighborly interest. Although repeated complaints have been made, kerosene still pays from 140 to 160 per cent. customs duties on its cost, lumber nearly 90 per cent. and lard 52 per cent, while a great percentage of American imports, such as furniture, cotton, linen and woolen fabrics, hardware, cutlery, clocks, hams, butter, &c., pay over 50 per cent. on cost and freight." It is a curious circumstance that the one monarchy on this continent should be especially favored by the United States in its commercial relations, rather than countries like Mexico, with whom it would most naturally sympathize as a sister republic.

The Water Bureau of Philadelphia awarded contracts for cast-iron pipe as follows: To the Mellert Foundry and Machine Company, of Reading, 20-inch pipe, 1½¢ cents per pound; 30-inch pipe, 1½¢ cents per pound for the first 600 lengths and 1.24¢ for the second 600; small specials, 2¼¢ cents a pound; large specials, 2½¢ cents per pound; to Daniel L. Dawson, breeches-pipe, 3½¢ cents per pound. The contract for large specials was divided between Dawson and the Mellert Company.

A sample taken from a pile of magnetite ore, approximating 400 tons of New Bed ore, at Mineville, in the Lake Champlain district, N. Y., to get at an average, showed by analysis 72 per cent. of iron and 0.018 per cent. of phosphorus.

## The Outlook for Lead.

The statistics for the production of lead recently published by the United States Geological Survey are instructive because they show how hopeless was the struggle of speculators last year to maintain high prices in the face of a very large increase in the output, and because they indicate that for the near future there is little hope for an advance in the price over present figures. In fact, the question may well be raised whether under certain circumstances lower figures are not probable.

For ten years the make in the United States has been as follows:

*Production of Lead in the United States, Net Tons.*

Year.	Desilverized.	Non-argentiferous.	Total.
1878.....	64,290	26,770	91,060
1879.....	64,650	28,180	92,780
1880.....	70,185	27,690	97,825
1881.....	86,315	30,770	117,085
1882.....	108,975	29,015	132,590
1883.....	122,157	21,800	143,957
1884.....	119,975	19,962	139,937
1885.....	107,457	21,975	129,412
1886.....	114,329	20,800	135,629
1887.....	136,562	25,148	160,706
1888.....	151,465	29,080	180,555

The desilverized lead is that produced in the Rocky Mountains containing silver and subsequently specially treated to extract the silver and refine the lead. With the exception of a small quantity, which is bought by the refiners for special purposes, the lead produced in Missouri and Kansas does not go through the same channels, roughly speaking. The principal increase, it will be observed, is in desilverized lead, carrying the 1888 product to double the figures reached a decade since. The production of late years has probably been unjustly credited to the United States. Since 1886 an important percentage of it is really the produce of Mexican miners whose ores are shipped to smelting works in the United States for treatment. The magnitude of this business for 1886 is not known. For 1887 it was estimated at 15,000 tons, while for 1888 an official report of the Bureau of Statistics shows the lead contents of Mexican ores imported to have been 28,636 tons of 2000 pounds. Deducting this from the figures given for the production of desilverized lead, we find that the American product was 120,000 tons in 1887 and 123,000 tons in 1888. With the non-argentiferous lead added, the yield of the mines in the United States was roughly 145,000 tons in 1887 and 152,000 in 1888. In other words, our domestic supply has not developed very rapidly.

A widespread agitation exists throughout the Rocky Mountain camps and among the Missouri and Kansas miners against the continuance of imports of Mexican ore, and manufacturers and dealers in white lead, sheet lead, pipe and shot should

closely watch developments in the coming struggle, since the decision reached is likely to have considerable influence in shaping the course of the metal for years to come. A peculiar condition of affairs has led to the development of the imports on a large scale of lead in Mexican ores. Like the majority of mines in the Rocky Mountains, some Mexican ores carry both lead and silver. Under our tariff silver ore is duty free, while lead in ore pays 1½ cents a pound. The delicate question naturally arises when an ore containing both metals ceases to be a lead ore and becomes a silver ore. Following its general practice, the Treasury Department has held that the classification must be guided by the decision which is the component of greater value. If, therefore, a lead ore imported happens to have enough silver in it to make its contents of the precious metal figure out to be of greater value than the lead, then it comes in free.

It is under this ruling that the large quantities of the baser metal have entered to compete with the domestic product. Two large smelting plants have been built at El Paso to treat these ores, and the American railroads that have pushed into Mexican territory have derived a large revenue from their transportation. Naturally a vigorous protest has arisen, especially since the speculation collapsed last October under the pressure of this very supply, and prices have materially declined. Colorado, Utah, Idaho and Montana are deeply affected by the matter, especially the latter, with their allied railroad interests. During the past two years the Cœur d'Alène district in Idaho, once the scene of a mad stampede for gold placers, had developed more substantial and lasting wealth in its argentiferous lead mines. It is estimated that in 1888 the district shipped ore and concentrates whose metal contents aggregated not less than 22,000 tons. Additional railroad facilities have been provided and are being supplied, and more concentrating works are building, so that local authorities promise an output of not less than 30,000 tons, and possibly 33,000 tons, of metal providing adequate prices for lead can be secured. Montana has a deep interest in these developments, because the new State is to do the smelting, two large works having been built during 1888, one at Great Falls and the other at Helena. Thus far the new Idaho district has done little more than fill the gap caused by the decline in some of the other Rocky Mountain States and Territories, but the miners and smelters naturally fear that if Mexico continues to crowd the market their own development will be checked, if not imperiled.

It is true that the latest advices are that the new railroads which have connected Gulf ports in Mexico proper with the mining regions in that country are encouraging the export of the ore to Europe, and that for that reason an important diversion is taking place. But it remains to be seen how long the European markets are going to stand up against the promised influx of lead from the new Australian mines. Should that prove to be serious, then the current may flow back into the same channels which it has occupied during the past year. With Idaho in the Northwest and Mexico in the Southwest rushing lead into our markets, and the

older Colorado and Utah districts striving to hold their own, the supply of lead promises to be very ample—too large, in fact, to allow of any advance, and tending rather to aid a further decline. Should the efforts of those succeed who are eager to stop the free importation of Mexican lead as silver ore, then matters would assume a very different aspect. The balance would then tend decidedly to swing in the other direction. It is for this reason that those in any way interested in the metal should watch for any developments in Washington.

## The Advance of Steel.

There is much food for study in the statistics just published by James M. Swank, general manager of the American Iron and Steel Association. What is particularly interesting is his repetition of an effort to secure data concerning the quantity of steel rolled for other purposes than rails. This is, of course, the principal though not the only factor in the question as to what extent steel has superseded iron. Mr. Swank has followed his usual method of computation, as follows:

	1887. Net tons.	1888. Net tons.
Bessemer steel ingots.....	3,288,857	2,812,500
Less 12½ per cent. for oxidation and crop ends.....	411,045	351,563
Finished Bessemer steel....	2,877,812	2,460,937
Steel rails, except from purchased blooms.....	2,290,197	1,529,832
Steel not in rails.....	587,115	931,105

Mr. Swank has compiled similar figures for a series of years, as follows:

	Net tons.
Bessemer Steel not Marketed as Rails.	
1882.....	150,045
1883.....	198,974
1884.....	231,400
1885.....	414,435
1886.....	478,907
1887.....	587,115
1888.....	931,105

To this, of course, must be added the output of finished goods from open-hearth steel, and that rolled from imported slabs, blooms and billets. The product of open-hearth steel was 352,036 net tons, equal, using the same system, to 303,770 net tons. Add about 26,000 tons of steel hoops and sheets, 100,000 tons of blooms and billets and 90,000 tons of steel wire rods imported, and a total is reached of about 1,450,000 net tons. Last year we estimated the consumption, in a similar manner, at 1,300,000 tons. In 1888 the American works displaced about 210,000 tons of foreign material and captured an increase of 150,000 tons.

Now, in 1887 the total of rolled iron was 2,588,500 net tons, as compared with 2,411,654 net tons in 1888, a decline of 176,846 tons. In other words, steel displaced iron to the extent of about 150,000 tons, and drove out foreign material to the extent alluded to.

Mr. Swank has this year again presented details of the production of rolled steel, which have been rendered more complete by the collection of statistics concerning the production of wire rods. He makes the total of rolled steel 1,201,885 net tons, including 216,174 tons of cut nails, 213,694 tons of plates and sheets and 772,017 tons of other rolled steel. The latter, of course, includes 298,770 net tons of steel wire rods, the total production of rods, by the way, having been 313,341 net tons. The consumption was considerably greater, including as it did about 26,000 tons of

imported plates and sheets, and at least 90,000 tons of foreign wire rods, drawn at barb-wire and wire-nail works.

#### Brazilian and Argentine Finances.

Of all the South American countries Brazil and the Argentine Republic are progressing most rapidly at present, and unless something unforeseen happens may continue to do so for some years to come. In May last year slavery was abolished in Brazil, field labor being disorganized thereby very little except in the cultivation of current food supplies, so that in all this year large amounts of Indian corn will have to be imported from the United States and of rice from Burmah. No disorders were caused by the freedmen anywhere; they picked the coffee crop, though slovenly, and if 80,000 tons less of sugar were produced in 1888 than in 1887, it was due to the drought and not to a lack of plantation hands. Instead of procuring Chinamen and Indian coolies to take the place of any negroes who might flock to the cities, the coffee planters of San Paulo and other localities situated in the mountain district liberally facilitated European immigration, following therein the example of the Argentine Republic. From an average immigration of 27,390 a year for ten years, the figures leaped in 1888 to 180,000 in the two ports of Rio and Santos alone. This year their number may swell to 200,000. The Argentine Republic received last year 175,000, and it is believed more than 200,000 may be looked for in the current year. What troubles the Argentines, however, is that so small a portion of the immigrants—only about 10 per cent.—devote themselves to agriculture. They see clearly enough that it is only the rapid development of their natural resources that can enable them to pay for the vast system of internal improvements now under way. Over 5000 miles of railway were under construction last year, and 3000 more are planned for 1889; but this means an addition of \$75,000,000 to the national debt. Ten thousand houses were built in Buenos Ayres in 1888, and the city has now a population of nearly 500,000, but this means, just as does the enormous premium on gold, feverish commercial speculation. So strongly does the Government feel that more labor is wanted, not for railroads and harbors, but for farms, that it is seriously proposing to restrict immigration, of Italians at least, to those who will give themselves to agriculture.

The public indebtedness of the Brazilian Government last year was 2,831,128,631 milreis, of 54 cents American. The budget for 1889 estimates the expenditures at 173,415,408 milreis and the revenue at 247,200,000, resulting in a deficit of 26,215,408 milreis. The real cause of the recurring deficits has been the heavy outlay on schemes of internal improvement, principally on railroads. If the debts of Brazil are greater than those of either Chili or the Argentine Republic, so is the foreign commerce, so is the national income, and so in many respects are the public resources. With all the wealth of the country pledged to pay its debts, and with a most honorable record of punctual fidelity to its obligations in the past, it is not surprising that Brazilian bonds have such an excellent footing in London, or that the adminis-

trators of Brazil's finances look forward so confidently to a prosperous future.

On March 31, 1888, the consolidated Argentine national debt amounted to \$140,355,772, against \$147,791,257 on March 31, 1887. The outlay last year was \$51,086,536 and the income \$53,743,800. The spirit of enterprise in the republic probably reached its climax in 1888, when during the first 11 months—without counting banks and railroads—no less than 51 stock companies were formed, with an aggregate capital of \$73,000,000. During the first 10½ months Europe absorbed last year £28,702,766 in the shape of Argentine loans of all sorts, national, provincial, municipal, railway, &c. The Netherlands Bank has declined to advance any money on Argentine securities. During the ten years between 1877 and 1887 the following items showed the percentage of increase set against each: Income of the State, 375; foreign commerce, 260; sea-going vessels entered, 324; area under culture, 500; value of crops, 360; telegraphs, 324; railroads, 330; immigration, 385; bank capital, 315; paper money in circulation, 247; public debt, 180; annual interest thereon, 160. Brazil cannot show a similar percentage of increase in the items named, because it had the incubus of slavery on its shoulders. Now that the latter is out of the way and coffee and sugar command high prices, all this is likely to be changed.

If only a portion of the work under construction which the *Railway Age*, of Chicago, reports in a special article, widely quoted, were taking iron and steel, our markets would have a very different complexion. Our contemporary figures out that during the first three months in the present year "the work of railway construction or inception has been going on in the name of 666 companies, representing a contemplated mileage of over 53,400 miles, of which over 14,800 appear to be at the present time under construction or under contract for gradual completion." The iron trade will receive this pleasing information with much amazement and some incredulity. The rail manufacturers particularly, who flatter themselves that they keep their thumbs very near the pulse of the patient, will be startled. Perhaps they are able to supply information which will take much of the elasticity from the buoyancy of our contemporary. It has been remarked again and again by nearly every leading manufacturer of rails in the country, in interviews with representatives of *The Iron Age*, that there are a good many inquiries in the market, but, as one of them put it, the majority of them are "cats and dogs." If rail-makers were to take bonds by the ream prettily printed in exchange for good metal they could fill their order books for a year to come. The most amazing propositions come to them, to be dismissed with a shrug or a smile, and the chase for *bond fide* business goes on as vigorously as ever. We hear of offers to take rails from a mill singled out by the discriminating buyer, provided the manufacturers will advance a trifle of \$10,000 or \$15,000 per mile to finish the grading. Then the generous builder will give the contract at \$26 at mill in exchange for long-time notes indorsed by the projectors and backed by bonds as collateral. The rail mills are not doing business in that

way, and until it becomes very much clearer than it is now where the money is to come from to carry on the mileage "under construction" iron and steel manufacturers will remain very conservative.

#### The Rise in Sugar.

For a year past the consumption of sugar has been gradually outrunning production; this fact was pretty generally known and the position of the staple all along inspired confidence, yet speculation was held in check by the rather abundant yield of beet root on the Continent of Europe in 1888. If the cane-producing countries in America and India had turned out their usual quota, a notable appreciation in the value of the staple might perhaps have been avoided, but it so chanced that the September cyclone in Cuba curtailed that crop a couple of hundred thousand tons, that Brazil had a shortage of 90,000 tons and that the small West India islands were backward and also produced less. While the United States were thus compelled to fall back on Java, Manila and beet-root sugar in Europe for the want of a sufficient supply from Cuba and Pernambuco, England had to buy beet sugar (for the lack of colonial cane sugar) on the Continent, where a group of speculators had got partial control of the market. Meanwhile, in spite of higher prices, this country consumed last year over 10 per cent. more sugar than in 1888, and has this year continued at the same rate. On April 11 the stock on this coast at the four ports had thus dwindled down to 19,083 tons, against 105,289 at the same date last year. In Cuba the available sugar is also held by speculators, and the price they dictate has to be submitted to. Last week five Spanish steamers were chartered to take some of this sugar to New York, Philadelphia and Boston. This shows how pressing the demand must be. At the lowest point last year fair refining Cuba was sold in New York at 4½ cents; it now commands 6¼ cents. On April 1 the visible supply in Europe and America, Cuba included, was 1,026,061 tons, against 1,309,168 in 1888 and 1,467,669 in 1887. Our greatest consumption is during the summer months. Should there be a bountiful fruit crop our requirements will be very large unless checked by excessively high prices, which for aught we know may rule by that time. With the grip which the Sugar Trust has on the market the outlook for consumers is anything but pleasant under the circumstances, but those who speculate in Sugar-Trust certificates have some cause for feeling bullish.

A good many people in the iron trade seem to be puzzling over the question why the steady advance in prices abroad has not a direct effect upon our drooping markets. The fact is forgotten that, after all, the influence of foreign markets upon our own is really only negative, that prices abroad influence ours only when our production is unable to supply the demand, except at a heavy advance, or when the markets in Europe are relatively much weaker than ours. For some time past conditions have been unusual. In former years the first impulse in an upward movement came from this side of the Atlantic. Lately the rise there has taken place in spite of an absence of a demand from us. Their own and other countries throughout the world have been buyers to such an extent that the gap

caused by the falling off in orders from us has not alone been filled, but there has been business beyond that. The result has been that they have been independent of us, and that we have not been influenced by them. Home competition with us is alone responsible for driving prices to present low figures. The foreign markets have had nothing to do with it. We cannot hope for an improvement of any moment until the demand has developed notably or production has been lessened by the exhaustion of weaker concerns. The only possible source of uneasiness which the present condition of the foreign markets may cause, so far as the more distant future is concerned, is that the boom abroad may collapse by the time we have reached the turning point. That is a contingency which it is hardly worth while discussing now.

### The Charcoal Furnaces April 1.

The current product of the charcoal furnaces throughout the United States fell off in March, and the plants entered April with a lessened production. Thus, although the same furnaces were at work in Michigan, the March product was only 15,189 gross tons, as compared with 15,365 gross tons in February, a month shorter by three days. In detail the record is as follows:

Charcoal Furnaces April 1.

Location of Furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	7	560	7	530
New York.....	10	3	412	7	530

<b>Total Sept. 1.....</b>	<b>176</b>	<b>67</b>	<b>11,243</b>	<b>109</b>	<b>10,004</b>

In New York Copake is again at work, and since the 1st two stacks have blown in in Pennsylvania. In the Hanging Rock region of Kentucky both furnaces are now idle, Bellefonte having stopped on the 18th ult.; to put in a new hearth and a Player hot-blast stove, which it is expected will be completed by May 1. In Maryland Muirkirk is again out. In Virginia Reed Island resumed on the 15th ult.; Walton is getting ready; Beverly and Cedar Run are to follow early in May, and Foster's Falls in June. In Ohio Bloom is again a producer, having had a good start. Mount Vernon is to blow in at an early date. In the Northwest Hinkle continues its brilliant record, having made 3004 gross tons in 31 days. In Alabama Round Mountain resumed, and Gadsden has begun work since the 1st. Tecumseh suffered from a stoppage of 16 days during March. In Texas the Old Alcalde blew out during March.

Reports from every furnace in the Mahoning Valley, Ohio, show the product to have been 38,506 tons in March.

### Our Iron and Steel Production in 1888.

Mr. James M. Swank has just published his annual statistical report for the American Iron and Steel Association, of which he is manager, the following table showing the production of the leading iron and steel products in 1888, in comparison with the figures for the three preceding years:

Net tons of 2,000 lbs. (Except nails.)	1886.	1887.	1888.
Pig iron.....	6,365,328	7,187,206	7,268,507
Bessemer-steel ingots.....	2,541,493	3,238,377	2,812,500
Bessemer-steel rails.....	1,763,667	2,364,152	1,562,681
Open-hearth steel ingots.....	245,250	300,717	362,086
Open-hearth steel rails.....	5,255	19,208	5,261
Crucible-steel ingots.....	80,009	84,421	78,713
Rolled iron, except rails.....	2,259,943	2,565,438	2,397,402
Iron rails.....	23,679	23,062	14,252
Kegs of cut nails—100 lbs.....	8,160,973	8,908,870	6,493,591
Pig, scrap & ore blooms.....	41,908	43,306	30,875

The total production of pig iron in the United States in 1888 was 7,268,507 net tons, or 6,489,738 gross tons, the largest yearly production ever attained in this country, exceeding by 72,590 gross tons the extraordinary production of 1887. The total production in 1887 was 7,187,206 net tons, or 6,417,148 gross tons. The production in the first half of 1888 was 3,382,508 net tons, and in the second half it was 3,886,004 net tons, or 3,020,092 and 3,469,646 gross tons respectively.

In the following table the production of pig iron in 1888 and in the three preceding years, classified according to the fuel used, is given in net tons:

Fuel used. Net tons.	1886.	1887.	1888.
Bituminous.....	2,075,686	3,806,174	4,270,635
Anthracite and coke.....	1,176,477	1,655,851	1,919,640
Anthracite alone.....	277,913	443,746	418,749
Charcoal.....	309,844	459,567	578,182
<b>Total.....</b>	<b>4,828,899</b>	<b>6,365,328</b>	<b>7,187,206</b>

For a series of years the production in this country and the estimated consumption were as follows, in gross tons:

Production.	Consumption.
1881.....	4,144,254
1882.....	4,623,328
1883.....	4,596,510
1884.....	4,067,888
1885.....	4,044,826
1886.....	5,633,329
1887.....	6,417,148
1888.....	6,489,738

The following table shows the production of Bessemer-steel ingots, the output of steel by the Clapp-Griffiths process being added in the totals and given separately also under it:

Ingots.	First half 1888. Net tons.	Second half 1888. Net tons.	Total 1888. Net tons.	Total 1887. Net tons.
Pennsylvania.....	749,993	862,636	1,592,629	1,752,445
Illinois.....	321,115	299,741	620,856	837,513
Other States.....	383,180	295,635	678,815	678,899
<b>Total.....</b>	<b>1,384,288</b>	<b>1,428,212</b>	<b>2,812,500</b>	<b>3,268,857</b>
Clapp - Griffiths only.....	36,070	45,087	81,157	68,679

The proportion of steel rails of the whole was very much smaller than usual, the figures standing as follows:

Rails.	First half 1888. Net tons.	Second half 1888. Net tons.	Total 1888. Net tons.	Total 1887. Net tons.
Pennsylvania.....	420,101	491,105	911,206	1,221,289
Illinois.....	256,823	231,816	488,639	728,526
Other States.....	98,357	31,650	129,987	340,382
<b>Total.....</b>	<b>775,281</b>	<b>754,571</b>	<b>1,529,852</b>	<b>2,290,197</b>

An interesting set of figures is added to show the output of the Chicago and Pittsburgh districts, the rivalry between them making the comparison of special interest:

Counties.	1887. Gross tons.		1888. Gross tons.	
	Ingots.	Rails.	Ingots.	Rails.
Cook County, Ill.	531,064	439,845	373,106	302,722
Allegheny County, Pa..	518,694	287,363	451,127	154,882

It may be added, however, that the current year, with its comparatively full work thus far at the Edgar Thomson plant, and the addition of the Allegheny Bessemer on the one hand and the relative idleness of the Chicago mills on the other, is likely to reverse the figures in favor of Pittsburgh.

The production of open-hearth steel fell off slightly during 1888, the decline, however, taking place almost exclusively in the Western and Southern States, while Pennsylvania again forged ahead. The figures printed below show the production for a series of years:

Years.	New England, New York and New Jersey.	Pennsylvania.	Western and Southern States.	Total. Net tons.
1880.....	23,293	48,003	41,657	112,953
1881.....	29,600	63,363	53,968	146,931
1882.....	30,436	67,322	61,794	160,552
1883.....	30,904	69,368	43,442	133,679
1884.....	16,700	81,501	38,416	131,617
1885.....	18,268	94,966	36,220	149,381
1886.....	23,882	172,144	49,724	245,750
1887.....	18,442	270,710	71,565	360,717
1888.....	13,677	285,738	52,621	352,036

The enormous increase which has taken place in Pennsylvania since 1885 is probably due entirely to the use of natural gas as a fuel, which has led to the rapid development of open-hearth steel manufacture, notably in the Pittsburgh district. Since 1885, it will be observed, the make has trebled.

The production of bar, rod, bolt, hoop, skelp and shaped iron and rolled iron axles in 1888 amounted to 1,819,585 net tons, against 1,917,403 tons in 1887, a decrease of 97,818 tons, or 5 per cent. Pennsylvania made over 46 per cent. of the total production of these forms of iron in 1888, against nearly 48 per cent. in 1887; Ohio made nearly 19 per cent. in 1888, against 17 per cent. in 1887, 1886 and 1885.

The production of plate and sheet iron in 1888, excluding nail plate, amounted to 469,312 net tons, against 477,056 tons in 1887, a decrease of 7744 tons. Pennsylvania made 76 per cent. of the total production in 1888, against over 75 per cent. in 1887, and Ohio made nearly 13 per cent. in 1888, against over 11 per cent. in 1887.

Mr. Swank also gives the output of street rails, the quantity rolled in 1888 being 50,345 net tons, all of which, except 2000 or 3000 tons, were made of Bessemer steel. In 1887 the quantity rolled was 57,362 tons, while in 1886 the quantity produced was 48,009 tons.

It is stated that water gas is gaining in favor as a fuel for open-hearth furnaces in Germany and Austria. Hoerle has been running with water gas for some time, and at Witkowitz, Austria, it is also introduced. At the latter place the air is heated to from 1200° to 1400° Celsius, and yet the gas of combustion escaping from the regenerators carries only 400° to 500° Celsius. The furnace produces 20 tons of steel a day, the consumption of gas being 60 cubic meters per 100 kg. of steel, which is equivalent to about 400 pounds of coal per gross ton of ingots, or about 47 per cent. of the fuel consumption of the ordinary furnace fired with producer gas.

## Edward P. Allis.

The death of Edward P. Allis, of Milwaukee, which occurred on the 1st inst., after a very brief illness, removes from the manufacturing interests of the Northwest one of their most prominent representatives. In his lifetime he had built up a small concern, known as the Reliance Works, with but a limited local business, into a vast establishment, employing 1500 workmen and sending its products all over the civilized world. He was a typical American, born and educated in the East, but entering the arena of business activity in the more promising West. He was born at Cazenovia, N. Y., on May 12, 1824, and was educated with a view to the practice of law, graduating from Union College, Schenectady, in 1845. Preferring an active business life to the professional career which had been mapped out for him, he located in Milwaukee in 1846, and opened a leather store in connection with William Allen, the style of the firm being Allis & Allen. They built a large tannery at Two Rivers, Wis., and conducted an extensive business, terminating their connection in 1854, when Mr. Allis sold out his interest in the firm and entered the real estate and brokerage business in connection with John P. McGregor. In 1860 those two gentlemen and Charles D. Nash concluded to purchase the Reliance Works, which had been established by Decker & Saville about 13 years previously, and consisted of a small stove foundry and machine-shop. The owners had failed in 1857, and the works were taken by the creditors and were being run under the management of S. S. Daggett when the transfer of proprietorship above noted was made.

The true business career of Edward P. Allis dates from the day when he became one of the owners of the Reliance Works. He had faith in their future, and did not hesitate to show it by his actions when his partners concluded to withdraw from the enterprise. He purchased their interests, became sole owner and assumed personal control and supervision of every detail of the establishment. In 1865 his business had so increased through his energetic efforts, indomitable perseverance and sagacious management that he was obliged to look for larger quarters, and the present site was selected for new works, being about a mile from the old location on West Water street. From year to year these works constantly expanded, until at the time of his death Mr. Allis stood at the helm of the largest manufacturing concern of its kind in the world, doing a machinery business of over \$3,000,000 per annum. The phenomenal development of these works is to be attributed solely to him. He called able lieutenants to assist him, but it was with the full knowledge that their special training and attainments were required in order to accomplish purposes which he himself had foreseen were essential. He was therefore one of those exceptional men endowed by nature with special facilities

for leadership. He knew how to manage other men. No employer ever had the welfare of his workmen more constantly in mind. He was at all times approachable and ready to listen to claims of right and justice or even ambition, recognizing and rewarding ability and rebuking favoritism. It can safely be asserted that no employer has held the warm admiration and loyal support of his workmen in greater measure than Mr. Allis.

Mr. Allis always occupied a prominent position in the social and business circles of Milwaukee, and his loss is keenly felt by that city. He was a fine scholar and a patron of art, having one of the choicest collections of paintings in the West. He took a lively interest in the questions of the day, and kept abreast of the scientific and mechanical developments of the age. He was quiet in his manner, simple in his

EDWARD P. ALLIS, OF MILWAUKEE, WIS.

Born May 12, 1824; Died April 1, 1889.

tastes and inclined to be reticent but positive in his convictions, and ready at all times to back up his opinions with cogent reasoning. In 1877 he was the Greenback candidate for Governor of Wisconsin, and lifted that party to a position of influence in State politics which was held for several years. In 1888 he returned to the Republican party, and took an active interest in the campaign, influenced by his belief in the policy of protection. The great works which were built up by Mr. Allis will continue their operations on the lines laid down by him and which have proved to be so successful. Several of his sons are interested in the establishment, and have already demonstrated their superior business qualifications.

Some idea of the violence of the storm through which the men-of-war were wrecked at Apia may be gained from the fact that the Calliope could only make half a knot an hour, although she is rated as a 15-knot ship.

## The National Lead Trust.

Considerable interest is being taken in Wall street and in the metal trade in the movement of Lead-Trust stock. The name is hardly well chosen, since the company has only a moderate interest in pig lead, so far as product is concerned. Last year a company was formed, embracing a lead smelting works at Socorro, N. M., the refinery of the St. Louis Smelting and Refining Company and a number of St. Louis white lead works. At the time the movement attracted considerable attention, but was lost sight of subsequently. One by one a number of large white lead manufacturing plants in the United States were taken into the trust, a valuation being made of the plant and trust certificates to the extent of four times that valuation issued in payment therefor. It is estimated that from 50 to 60 per cent. of the white lead productive capacity of the country is now controlled by the trust, which then succeeded in inducing all the leading independent manufacturers, with the exception of one, in joining a pool based on the allotment plan in white lead. The result has been an advance in that commodity to a minimum of 6 cents a pound in the largest quantities and to an average of about 6½ cents on all sales. At the same time the advantage to the St. Louis refinery was the fact that it always had secured to it a market, a large proportion of the product being shipped to Eastern members of the trust. The refinery itself has developed its production in a very rapid manner, it being estimated that it is likely to produce this year close upon 30,000 tons of refined lead. It is urged in behalf of the trust that outside competition is not so readily developed in white lead, since a very large amount of working capital is needed and the introduction of a new brand of the pigment is difficult. Wall street has taken an interest in the matter since the report that capitalists identified with the Standard Oil Company have been heavy

buyers of Lead-Trust certificates for some time past; that the trust is making large quantities of money, and is likely to increase its earnings as soon as the present comparatively high-priced stock of raw material purchased before the break of last fall is worked up.

F. Valton reports in the *Génie Civil* that Alexander Pourcel has succeeded at the new basic open-hearth steel works of Bell Brothers, of which Sir I. Lowthian Bell is a member, in producing from Middlesbrough pig carrying 1.7 per cent. of silicon and as much phosphorus, steel with as low as 0.03 per cent. of phosphorus. The lining of the furnace is chrome ore.

We understand that an official invitation has been sent by the Council of the American Institute of Mining Engineers to the British Iron and Steel Institute to hold the autumn meeting of 1890 in the United States.

**The Tennessee Coal, Iron and Railroad Company.**

The annual report of this, the largest coal and iron company in the South, for the fiscal year ending January 31, 1889, has been made for the meeting of the stockholders which was held on the 1st inst. The retiring president, Mr. Nathaniel Baxter, Jr., makes the following statement in regard to the production of the different departments of the company:

Division.	1887-88. Tons.	1888-89. Tons.
Tracy City, coal.....	426,274	413,631
Tracy City, coke.....	155,253	154,414
Cowan, pig iron.....	24,540	18,112
South Pittsburg, pig iron...	43,564	56,779
South Pittsburg, coal.....	15,266	73,699
South Pittsburg, coke.....	4,014	26,346
Birmingham, pig iron.....	41,068	47,770
Birmingham, coke.....	64,071	79,786
Pratt Mines, coal.....	718,824	888,247
Pratt Mines, coke.....	106,649	196,059
Ensley, pig iron.....		78,089
Inman Mines, iron ore.....	107,750	126,271

Total output.	1887-88. Tons.	1888-89. Tons.	Increase. Tons.
Coal.....	1,160,364	1,375,577	215,213
Coke.....	329,987	456,805	126,818
Pig iron.....	109,160	200,750	91,590
Iron ore.....	107,750	126,271	18,521

In order to provide working capital and yet not delay the completion of the Ensley furnace plant, the proposal was made to the stockholders to sell the company \$830,000 of stock at 30 cents, and to buy \$1,000,000 from the company, at 90 cents, of stock having a cumulative 8 per cent. preference dividend attached to it. This operation was carried out, netting \$642,157.72, after deducting the expenses incident to issue, sale and listing. The common stock of \$9,000,000 is held by 259 persons, while 92 are on the books as holders of the \$1,000,000 8 per cent. preference stock. The fixed charges, according to the statement of Jas. Bowron, secretary and treasurer, are \$420,050, including 6 per cent. on \$5,156,200; 7 per cent. on \$1,015,000, of which \$6,007,800 are in circulation. The sinking funds call for 1 per cent. on \$3,640,000 and 1½ per cent. on \$1,279,200. There is to be deducted 6 per cent. on \$236,000 held by the trust company for exchange. This makes the total fixed charges payable \$420,050, of which \$343,557.29 are chargeable to profit and loss, leaving \$76,492.70 available for reduction of the bonded debt in 1889. In October, 1886, the company entered upon a scheme of enlargement and development, to which there was a total disbursement of \$2,154,234.86, the totals being as follows:

	Oct. 1, 1886, to Jan. 31, 1888.	Feb. 1, 1888, to Jan. 31, 1889.	Total.
At the Ensley division.....	\$377,631.39	\$421,255.54	\$1,098,886.98
At the Pratt Mines div....	499,367.39	172,745.76	672,103.15
At the South Pittsburg division.....	290,107.56	41,348.99	331,456.55
At the Bir- mingham division.....	Cred. 69.43	3,110.05	3,040.62
At the Tracy City div.....	7,356.90		7,356.90
Ch'd through Nashville books.....	42,422.42	Cred. 881.71	41,540.71
Totals.....	1,516,806.23	637,628.63	2,154,434.86
Less credits at Cowan div.		200.00	200.00
Final totals	1,516,806.23	637,428.63	2,154,234.86

The undivided balance brought forward from the preceding year was \$404,747.38. The aggregate profits from the year's business and the sale of preferred stock amounted to \$1,223,250.14, a total of \$1,627,997.52. After paying interest ag-

gregating \$836,696.98 and a dividend of \$40,000 on the preferred stock, a balance remained to credit of profit and loss of \$1,251,800.55. In detail the profits of the fiscal year on the different divisions were:

Tracy City division.....	\$127,878.12
Cowan division.....	7,174.23
South Pittsburg division.....	27,641.88
Birmingham division.....	76,381.58
Pratt Mines division.....	213,288.76
Ensley division.....	213,728.35
	\$666,062.42

The Pratt Mines division shows the heaviest profit on the coal account of \$170,738.33, while the principal profit on the Ensley division is, of course, on pig iron, of \$202,851.23 on a product of 78,089 tons. The Birmingham division shows a profit of \$75,282.91 on 79,786 tons of pig iron, while at the Cowan division, where the product was 18,112 tons, the profit on pig iron was \$2659.24. South Pittsburg, with an output of 56,779 tons of pig iron, is credited with \$13,563.70 profit thereon. The Tracy City division, including the Inman Mines and the Tracy City coke furnace, is credited with \$83,583.47 on an output of 126,271 tons of ore, and \$29,972.02 on 154,414 tons of coke.

**Washington News.**

(From Our Regular Correspondent.)

WASHINGTON, D. C., April 18, 1889.

The ordnance officers are determined not to lose any grounds for a thorough test of the adaptability of cast-steel guns to warlike work. The Thurlow gun, which met with better success in the firing test than the Pittsburgh gun, having gone through with the first requirements, both firing and gauge, is now charged with showing signs of scaling in the bore, which was discovered upon regauging. The friends of the gun claim that this is the result of some defect in the casting, and does not impair the strength of the gun. It is proposed, however, to subject it to a more severe firing test than would be required in actual service. If the gun bursts it will doubtless be claimed that the whole system is impracticable. The officers are evidently determined to give the theory of cast-steel guns a severity of experimental strain which, if overcome, will not only place this class of guns in high favor, but will simplify and cheapen gun construction.

Secretary Windom has determined upon a practical solution of the tariff question. It is his intention, as soon as the personnel of the customs service has been organized, to place in the hands of the collectors of customs at certain leading importing cities of the country a copy of the Senate tariff bill, with instructions to apply its provisions to the customs service in actual practice. The Secretary says that the tariff question has now been one of long agitation, and unless settled in some practical way will continue for an indefinite time to agitate and disturb the industries of the country. It is his purpose to give particular attention to the workings of the schedules of metals, wool and woollens, silks and cotton fabrics. The metal provisions of the Senate tariff bill are very elaborate. This schedule, under which there has been so much appeal and litigation, will be put to a thorough trial.

The Secretary has not determined whether he will make the results of this inquiry the basis of a special report on tariff revision in his own communication to Congress, or whether a bill will be formulated and submitted to the Administration leaders of the House for introduction and reference to the Committee on Ways and Means. The prominent Republicans who are in the city, and particularly Senator Allison, who had charge of the Senate bill, think that the Secretary's plan is an

excellent one, and will co-operate with him in his effort to solve the tariff problem. The Secretary, as every one knows, is a strong Protectionist. He believes in fostering the tin-plate, wire and wire-rod and cotton-tie industries, and various other branches of metallurgical interests, to the utmost extent of sagacious legislation.

Captain Howison, president of the Steel Inspection Board, is engaged in preparing schedules and instruction for the corps of inspectors of material which will be used in construction of the additional vessels of the navy authorized by Congress. The meeting of the president of the Inspection Board, the chief constructor, engineer-in-chief and representatives of the manufacturers, while it afforded an opportunity for an exchange of ideas, resulted in no change of plans as contemplated. It was found that the inspections of boiler plates and material for use in the ships at the navy-yards would not answer the purpose. The manufacturers were unwilling to assume the responsibility. They preferred to have a representative of the Government inspect the materials and progress of manufacture and the results at the works before the material was subjected to the additional expense of transportation. The duty of an inspector is very severe. It has been the subject of complaint by officers, which led to the attempt of the Secretary to change the method of inspection. The officers are required to examine the material when being prepared, to see it placed in the furnaces, to watch its treatment, to see it run into ingots and to follow every subsequent stage in order to have a complete record of the physical properties and chemical attributes of the product. In the indorsement on the report of the board, the Secretary authorized the continuance of inspections under the old rules.

Captain Howison says that the report of the results of test is not entirely completed, but when it is it will show the wonderful strides made by the steel producers of the United States since the system of inspection was inaugurated. The inspection of material for the new ships was never in a more efficient condition, and results are being achieved which in the beginning were regarded as impracticable.

Naval constructors, engineers and ordnance officers are anticipating with marked interest the completion of the Herreshoff torpedo-boat which is being constructed for the Navy Department. If the claims of the constructors are realized this small craft will be one of the most destructive engines of naval warfare afloat, and with the dynamite cruiser will place the American navy in possession of two methods of offense which will not be exceeded by any navy in the world. The boat is 137 feet long, 14½ feet beam and 8 feet depth of hold. She will have a secondary battery of two 6-pounders, machine guns, and not less than 20 knots per hour speed. Her boilers and engines possess great power. The vessel is constructed in eight watertight compartments. The torpedo shutles on either side of the boat are so placed as to be protected by the turtle-back of the forward part of the boat. The contract price is about \$83,000, and a bonus of \$1500 extra for each quarter knot made in excess of 23 knots. It is expected that the trial of this diminutive but formidable craft will take place in about a month. Naval officers, who are waiting for the debut of the craft with great interest, will send a large representation to witness her performance in Newport waters when the trial takes place.

The Dominion Customs Department has decided that the rate of duty on sheet brass, plain, stamped or figured, cut into narrow strips, shall be 30 per cent. ad valorem.

### The English Compound Locomotive.

Some time since the Pennsylvania Railroad Company brought from England a duplicate of one of the engines which had made such remarkable runs on the London and Northwestern road. The engine was assembled at the Altoona shops and is now being tested. In order that the test of the engine should be as favorable as possible an engineer familiar with its construction and operation was brought from the other side and placed in charge. The new locomotive is a compound, has two high-pressure cylinders placed outside and one low-pressure inside. The two pairs of driving-wheels are unconnected, and are driven, one from the high-pressure and the other from the low-pressure cylinder. The two high-pressure cylinders receive steam direct from the boiler, use it expansively and drive the two trailing wheels. From there the steam passes to the low-pressure cylinder, which is placed under and behind the smoke-box. Here it again expands and drives the forward pair of wheels. The steam then escapes through the smoke-stack. The engine weighs, when in working order, 95,200 pounds, the tender, when empty, weighing 27,000 pounds. The driving-wheels are 6 feet 3 inches in diameter. The high-pressure cylinders are 14 by 24 inches, and the low-pressure 30 by 24 inches. The low-pressure cylinder slide-valve is placed above the cylinder, while in the high-pressure cylinders the steam-chests are beneath them, this construction being adopted to allow the valves to drop off the face of the chest when the engine is running but not using steam.

An interesting account of a ride on this engine is given by a representative of the *Railroad Gazette*, who notes some of the peculiarities of the engine as compared with the American type. We quote as follows:

At starting the rear drivers are allowed to slip a few turns until the low-pressure cylinder has a supply of steam at a pressure of 40 pounds, as shown at the gauge connected with the receiver. The valve motion regulating the steam admission to the low-pressure cylinder is almost always run at full gear. This gear is operated by a separate reverse lever not unlike our own type. The valve gear for the high-pressure cylinder is operated by means of a screw and wheel with a handle attached, as the custom is on English locomotives. The location of the cut-off point is shown by an index finger on the screw itself. Soon after starting the initial pressure in the large cylinder drops to 30 pounds. At this time the locomotive is exerting sufficient power to slip all of the wheels. The weight upon drivers being about 65,000 pounds, the pull upon the draw-bar must be considerable. One of the most noteworthy features of the action of this engine, and one which should give us all "food for reflection," is the action of the fire under the infrequent blasts from the exhaust nozzles. The number of blasts in a given time is just one-half of those from the common locomotive having the same size of drivers and running at the same speed. The reason of this is that there is only one low-pressure cylinder. With these infrequent blasts, and with a low force of blast scarcely audible in the cab, the fire burned brightly and supplied sufficient steam for the locomotive to exert its full power on the very steep grades at that part of the line between Altoona and Gallitzin before and after reaching the "Horseshoe Bend." This locomotive is fitted with a re-entering fire-door, and the very small amount of smoke issuing from the top of the stack showed the advantage of admitting air to the fire-box above the fire and deflecting it downward upon the bed of incandes-

cent coal. While passing around curves the engine showed no more tendency to "grind" or bind upon the track than the average American locomotive, but one could see she had been designed for very smooth roads; this was evident from the shortness of the springs and the consequent "rough riding" when passing over the proverbially good track of the Pennsylvania. The tender is a model of economical design, and presents to the mechanical department of our American railroads a design which is easily repaired, readily accessible at all times, and one which will pass curves readily and ride like a passenger car. While we do not believe that this locomotive as a whole, or in any large collection of its parts, will be adopted by American railroads as a standard design, we do think that the study of the elements of her design will lead to new inventions and prevent our own mechanics from falling into grooves of opinion, which is the way of all mankind when left to its own admiration.

The financial column of the Boston *Herald* contained the following recently: "The name of the new rolling mill to be formed by the union of the North Chicago Rolling Mill Company, the Joliet Steel Company and the Union Steel Company is the Illinois Steel Company. It is to have 11 directors, and the surplus of the various companies is to be capitalized, the total capital to be \$25,000,000. The value of the present plants, the cash surplus and new stock are thus tabulated in the official circular:

	Value of plant.	Cash surplus.	New stock.
North Chicago ..	\$7,000,000	\$2,000,000	\$2,000,000
Joliet .....	8,000,000	800,000	8,800,800
Union .....	2,750,000	800,000	3,550,000
Total .....	\$12,750,000	\$3,700,000	\$16,400,000

The Union Company have \$1,200,000 bonds out, which are to be converted into stock, and have a valuable coking plant in the Connellsville, Pa., region, which is to be purchased for say \$1,250,000 cash or stock, making the issued capital \$18,900,000, and leaving \$6,100,000 stock in the treasury. The above is the outline of the plan, which is subject to modification. The North Chicago stockholders will probably get one and one-half new shares for one present share."

One of the largest, if not the largest, wire ropes ever made for use in this country, says the *Engineer* of the 5th, was last week dispatched from the works of Dixon & Corbitt and R. S. Newall & Co., of the Teams, Gateshead. Its length is 4560 yards, and its circumference 5 inches. It weighs over 23 tons, and occupied three large railway trucks. The rope has been made for the North British Railway Company, and is to be used for drawing the trains from their Queen street station, Glasgow, to Cowairs. A wire rope has been used for this purpose some years, but this is the first one made on Lang's patent. This make of rope has been proved to be superior to any other for haulage and incline work, and we have no doubt will do credit to the makers. We understand that this firm, with a view to extend their business in the South Wales coal field, have recently established a manufacturing branch at the Windsor Rope Works, Cardiff.

A few days since dispatches from Troy announced the success of an experiment carried through at the works of the Troy Steel and Iron Company in making soft steel under a process invented by C. W. Bildt, chief chemist of the Washburn & Moen Mfg. Company, of Worcester, Mass. We learn that Mr. Bildt's process consists in a modification of the Bessemer, a special lining being used. He experimented with it some time since at Wheeling, W. Va., and, we understand, showed results fa-

vorable enough to impress Washburn & Moen with the value of the method. Not having a plant of their own, they arranged with the Troy Steel and Iron Company for carrying out experiments, upon the outcome of which was dependent a contract for a large quantity of billets. So far as we are advised, the matter has not yet progressed to a point where it is settled.

### America's Oil Supply.

An article published in the *Oil City Derrick* recently contains some statements regarding the area and character of the illuminating oil-bearing territory which should be reassuring to believers in a possible future oil famine in this country. The oil regions as now developed, the article states, "extend from Wellsville, N. Y., crossing Pennsylvania at nearly a 45° line to Dunkard Creek, in West Virginia. On an air-line this covers a distance of 204 miles in length, and, so far as developed, the belt is about 10 miles in width. The yield of the oil fields up to March 1, 1889, was 340,133,997 barrels. About 150,000,000 barrels of this came from McKean County alone, and this county is still good for 20,000 barrels a day." The total future production of this belt is beyond prediction. It has been noted, says the article, that oil-bearing rock, wherever found, usually yields about the same quantity of oil to a given acre. The yield of oil per square mile of territory during the first 15 years of its existence is about 1,000,000 barrels. It is considered certain, however, that each of the 204 square miles of territory will not yield this quantity. If it did the total production there outlined would be about 2,040,000,000 barrels. "This belt of 204 miles is a chain of pools, large and small, and until the area of each one is known the total yield would be simply conjecture."

The figures and estimates given relate only to the region where the illuminating oil of commerce is produced, namely, New York, Pennsylvania and the Mackburg district, in Ohio. The great Lima field is not taken into account, nor Colorado, California, Kentucky or Tennessee. "It has been stated that under the drill the Ohio field might be made to yield 100,000 barrels a day. This is not improbable, since the Bradford field in July, 1882, produced 105,102 barrels each day of that month. The Bradford field had no large wells compared with the geysers of Ohio. Lima oil is worth but about one-seventh as much as the Pennsylvania product, and can never come into competition with it as an illuminant, unless some new process of manufacture is discovered beyond anything now known. Its utility in the world's economy lies in the direction of fuel, and there is not much likelihood that it will ever be diverted from this field. Natural gas is the only fuel that can compete with it in cheapness, and that is not everywhere obtainable. Natural gas cannot be transported much above 100 miles, and oil fuel may be carried to the ends of the earth. As far west as Omaha it is now furnishing manufacturers a cheaper fuel than coal." With the above large supplies of oil, both for illuminating purposes and for fuel, in sight, the writer of the article apparently sees little reason to fear an oil famine, as he states it, as among the immediate probabilities.

It is stated that the annual report of the Crane Iron Company for the last fiscal year showed that on a product of 75,000 tons of pig iron the gross earnings were about \$81,500, while the net earnings were a trifle under \$25,000. It should be stated, however, that a coal strike early in the year 1888 reduced the earnings of the company by about \$90,000.

## THE FREIGHT AGITATION.

### FINISHED IRON IN WESTERN PENNSYLVANIA.

Pittsburgh manufacturers are discussing eagerly the question of freight discrimination, and a movement is on foot to thoroughly organize. We have been favored with some data which will aid in a correct estimation of the rates paid on finished iron for various distances. We compile from them the following table:

Pittsburgh Rates on Finished Iron.

Miles.	Rate.	Per ton per mile.
100.....	\$3.06	8.60
150.....	1.79	1.19
200.....	2.01	0.75
250.....	2.91	0.91
300.....	2.91	0.82
350.....	3.36	0.76
400.....	3.36	0.72
450.....	4.14	0.87

### RATES ON SOUTHERN FINISHED IRON.

A leading manufacturer in the Birmingham, Ala., district sends us the following communication:

Judging from the reiterated statements of Carnegie and the numerous articles in the iron papers in reference to the rates of freight, the uninitiated would undoubtedly conclude that the Southern industries were carefully huddled under the protective wing of the railroads of this section, and that the railroads in the North were pursuing a cutthroat policy by taxing the industries with excessively high rates of freight. With the view of correcting this erroneous impression I have compiled some data, which I hand you herewith for publication, presuming that you will extend the courtesy of your columns in your usual impartial manner. In all our experience, during nine years, we have found that to competitive points we had to pay a higher rate per ton per mile than our Northern competitors, and for several years we have been making efforts to have a just equalization.

Birmingham, Ala., Rates.

Miles.	Rate gross ton.	Per ton per mile.
24.....	\$2.24	9.33
33.....	2.24	6.79
55.....	2.24	4.07
87.....	6.04	6.98
96.....	2.10	2.19
143.....	2.24	1.56
276.....	2.46	0.89
348.....	3.02	0.87

These figures certainly show that for hauls in their own particular territory the Southern railroads develop in the most orthodox manner the principle of taking all which the traffic will bear. The rates up to 150 miles are undoubtedly outrageous.

Our correspondent draws an interesting comparison between the Pittsburgh, Youngstown and Birmingham rates to Chicago, Kansas City, San Francisco and Los Angeles, Cal., which we reproduce:

	Pittsburgh.			Youngstown.			Birmingham.		
	Miles.	Rate gross ton.	Per ton per mile, cents.	Miles.	Rate gross ton.	Per ton per mile, cents.	Miles.	Rate gross ton.	Per ton per mile, cents.
Chic..	468	\$3.40	0.73	423	\$2.91	0.69	649	\$5.38	0.83

L. A..	2701	25.76	0.94	2656	25.76	0.96	2361	25.76	1.09

Nor is our correspondent content with allowing the impression to prevail that the rates on raw material to rolling mills in the Birmingham district are low. We quote the following figures on coal, ore and pig metal; all of them, it will be observed, are short hauls:

Miles.	Rate gross ton.	Per ton per mile.
8.....	\$0.28	3.11
9.....	.28	3.50
15.....	.28	1.87

Ore.		
7.....	\$0.25	3.57
14.....	.25	1.78
Pig Iron.		
6.....	\$0.28	4.68
7.....	.08	4.00

The following comparisons are made, too, to show that the differences in the rates on pig iron are not so great as claimed, the Shenango Valley and Birmingham being placed side by side:

Comparative Rates on Pig Iron.

	Shenango Valley.				Birmingham.			
	Miles.	Rate gross ton.	Per ton per mile.	Cents.	Miles.	Rate gross ton.	Per ton per mile.	Cents.
Chicago....	475	\$2.20	\$0.45		649	\$3.95	\$0.61	
Evansville..	550	2.50	.45		362	2.71	.75	
Indianapolis.	381	1.80	.44		504	3.21	.63	
Green Castle	419	2.20	.52		537	3.70	.69	
East St. Louis	506	2.50	.41		525	3.21	.61	

### RATES IN WESTERN PENNSYLVANIA AND OHIO.

Since the last issue of *The Iron Age* we have gathered additional figures. One of the most interesting documents in question dealing with short hauls is the Special Freight Tariff No. 124, issued by the Pennsylvania Company, which went into effect on January 14 of this year, covering shipments of pig iron, blooms, billets, muck bar, scrap iron and steel, skelp, native ore, cinder, scale, coal and coke in carloads between all stations Rochester to Leetonia, Newcastle to Shenango, all stations on the N. C. and B. V. R. R. all on the P. Y. and A. Ry. The rates in question are:

Distance.	Pig iron, blooms, muck, scrap, skelp.	Native ore, scale and cinder.	Coal.	Coke.
	Per gross ton.	Per gross ton.	Per net ton.	Per net ton.
Under 10 miles.....	Cts. 25	Cts. 25	Cts. 30	Cts. 30
10 and under 15 miles....	30	30	35	35
15 and under 20 miles....	35	35	40	40
20 and under 25 miles....	40	38	45	50
25 and under 30 miles....	45	40	50	55
30 and under 35 miles....	50	40	55	60
35 and under 40 miles....	55	45	60	65
40 and under 45 miles....	60	45	65	70
45 and under 50 miles....	65	50	70	75
50 and under 75 miles....	80	70	80	85

In the last issue of *The Iron Age* we printed figures bearing chiefly on a short haul on pig iron. Below we give data relating to rates on greater distances east and west for the Mahoning and Shenango valleys.

Rates on Pig Iron, Mahoning and Shenango Valleys.

Distance.	Rate gross ton.	Per ton per mile.
Miles.		Cents.
175.....	\$1.20	0.68
189.....	1.85	0.07
251.....	1.85	0.77
260.....	1.60	0.62
265.....	1.95	0.73
266.....	2.20	0.74
332.....	2.45	0.74
353.....	2.45	0.69
380.....	2.50	0.70
398.....	2.70	0.68
405.....	2.20	0.54
412.....	2.70	0.66
415.....	2.90	0.70
448.....	3.10	0.69
478.....	2.70	0.58
530.....	3.20	0.60
600.....	2.50	0.41
622.....	3.50	0.56
651.....	4.30	0.63
700.....	4.20	0.60
800.....	4.30	0.54

On distances of over 250 miles the rate therefore ranges within wide limits between 0.41 and 0.77 cent per ton per mile.

On partly-finished articles, like muck bar, wire rods, billets and blooms, we compile the following rates for Western Pennsylvania:

Rates on Muck Bar, Billets, Wire Rods, &c.

Distance.	Rate gross ton.	Per ton per mile.
Miles.		Cents.
8.....	\$0.40	5.00
40.....	.91	2.27
46.....	.80	1.74
66.....	.95	1.44
157.....	2.91	1.85
160.....	1.68	1.05
172.....	2.24	1.30
224.....	2.64	1.18
262.....	2.39	1.10
262.....	2.64	1.01
640.....	4.92	0.77
680.....	5.15	0.76

Here, too, the hauls for moderate distances between 50 and 200 miles are altogether too high, and should be very materially reduced.

It is interesting to compare these data with the rates paid on different hauls on pig iron east of the Allegheny Mountains by manufacturers in that section. We give the figures below:

Rates on Pig Iron in the East.

Distance.	Rate.	Per ton per mile.
Miles.		Cents.
5.....	\$0.30	6.00
8.....	.45	5.60
12.....	.35	2.91
14.....	.45	3.21
15.....	.50	3.33
16.....	.45	2.81
30.....	.50	2.50
42.....	.50	1.19
49.....	.60	1.23
56.....	.75	1.28
65.....	.90	1.38
69.....	.80	0.87
74.....	.80	0.81
85.....	1.35	1.59
86.....	.85	0.99
93.....	.90	0.97
105.....	2.24	2.18
100.....	.75	0.75
100.....	.90	0.90
110.....	1.17	1.06
112.....	1.25	1.11
126.....	2.00	1.59
136.....	2.00	1.47
140.....	1.40	1.00
151.....	2.00	1.32
164.....	1.20	0.73
190.....	2.00	1.08
216.....	1.20	0.56
234.....	2.00	0.85
262.....	2.86	1.09
365.....	1.50	0.41

It is only too evident from this table that there are amazing irregularities in the freight rates paid on pig iron, and that with a very few exceptions they are disproportionately high. It is clear that whatever may be the grievances of the manufacturers in other sections, the producers of Eastern Pennsylvania have more to complain of. On short hauls on ore and coal very heavy tolls are exacted. Looking over the whole field, and we have only gone over part of it, there is crying need for reform. The spirit with which manufacturers in different parts of the country have been met by railroad managers has been exasperating in the highest degree. At a recent conference held in Pittsburgh an official high in power in the Pennsylvania Company took the ground that if the pig-iron producers could not pay existing rates of freight they had better close down their furnaces until they could. Again and again have railroad managers appeared incapable of understanding that they must afford relief or lose a very large traffic. They seem to cling to the notion that because work has continued thus far it will go on indefinitely; that the freight carried for iron-makers is particularly suitable to compensate for money thrown away in wild competition on long hauls of other goods by burdening upon it high locals. A radical change is necessary in the method, or rather the lack of method, pursued by railroad managers. Broader, fairer views must prevail or all interests must suffer.

Thomas M. Jones, of the firm of Jones & Laughlins, and brother of B. F. Jones, died on Saturday last, aged about 60.

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., April 18, 1889.

**Pig Iron.**—The market does not show much rallying power, although there is a general feeling that prices cannot possibly recede below their present level. There is a great deal of hesitancy nevertheless; partly because of the shutting down of mills here and there, and partly because of unfavorable advices from the West and South. The outlook is very much mixed, making it almost impossible to form any definite idea of what the next turn in the market will be, or when it will be. Developments of an unfavorable character would certainly be met with a decided curtailment of output, which of course would lead to a stiffening in prices, but in spite of that, the market continues feverish, unsettled and if not weak, it is surely far from being strong. A great deal will depend on the outcome of events during the next 30 days. There must either be an increased demand, or a decreased production—not that there is any serious overproduction, but there are too many that are trying to sell for forward delivery. That is, bids are being solicited, although it is by no means certain that they would be accepted to anything like the extent that might be inferred from the urgency with which offers are sought for. This of course has reference more particularly to outside Irons. Standard qualities hold their position very fairly, but anything new or at all doubtful as to quality is hard to place, unless concessions of more or less importance are submitted to, and unfortunately this class of Iron seems to exercise a considerable influence at present. There is a great deal in the general outlook that is very encouraging, but as yet it is all in the future, while for the time being things are about as dull as they have been at any time during the year. Prices remain about as quoted last week—viz., \$17.50 @ \$18.50 for good to choice Pennsylvania brands of No. 1; \$16.50 @ \$17 for No. 2, and \$15 @ \$15.50 for Gray Forge. Southern Irons are offered delivered in consumers' yards at \$14.75 for Gray Forge, \$16 @ \$16.50 for No. 2, and \$17 for No. 1, but there is very little doing, except in low grades, at prices which are not made public.

**Blooms.**—The market is dull, but there is something doing all the time at about the figures quoted as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 3/4 "Bloom" ton of 2464 lb.

**Muck Bars.**—There is less disposition to quote prices, except for immediate delivery. Sellers ask \$27 delivered, and it would be difficult to secure fair-sized lots for less, providing that quality was all right. There are buyers at \$26.50, but no sales of any amount have been made recently.

**Bar Iron.**—Business remains in a most unsatisfactory condition, and, if changed at all since last week, it is not for the better. The absence of orders from large consumers is specially noticeable, so that there is quite a probability of some leading mills being shut down until business improves. There is something doing, of course, but not nearly sufficient to keep the mills running on a paying basis. Prospects are not encouraging either, and, while every one feels that the present condition of affairs cannot last much longer, manu-

facturers are getting tired of waiting and talk seriously of shutting down, rather than pile up stock for an uncertain market. The demand for Skelp Iron has also dwindled away to a mere nothing, so that, from whatever point of view the position is regarded, it is unsatisfactory. Prices, therefore, are greatly demoralized and hardly quotable except in a general way at from 1.75¢ to 1.80¢, subject to all sorts of concessions, according to circumstances.

**Plate and Tank Material.**—In this department there is a perceptible improvement. The leading mills are nearly all full for the next three or four weeks, while the number of inquiries denote continued activity. Prices are still down at the lowest for years—probably the lowest on record—but another couple of weeks' business like the last two would certainly lead to an advance. In fact it would be difficult, if not impossible, to duplicate some of the recent purchases, as sellers feel that prices are entirely too low. Quotations, therefore, are nominally unchanged, and for small lots are about as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 3 1/2¢.

**Structural Material.**—There is more doing in this department, and a better feeling prevails both as regards the present and the future. Specifications on old contracts are coming in quite freely, while the amount of work in prospect is very encouraging. Prices remain at a low point owing to the large productive capacity and to the eagerness with which their new business is competed for. Still, things are undoubtedly improving, and a little further on it is hoped that prices will begin to sympathize. Meanwhile quotations are nominally as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—There is a fair demand, and mills are running full without accumulating much stock. Prospects for the spring trade are thought to be favorable, and the following schedule of prices is well maintained:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined, No. 28.....	3.60¢
Common, 1/2¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3 1/4¢
Best Soft Steel, Nos. 21 to 24.....	3 1/2¢
Best Soft Steel, Nos. 25 to 26.....	3 3/4¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, 1/2¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67 1/2 %

**Steel Rails.**—The market is a mystery, considering the general surroundings. Prices are now within about a couple of dollars per ton of those quoted in foreign markets, and yet there are no indications of our markets moving in sympathy. Inquiries are about as usual, but the amount of business taken from week to week is very disappointing. Prices are nominally \$27.50 @ \$28, at mill, but it is not unlikely that these figures are being shaded, although in this market buyers admit that they find prices very firm.

**Old Rails.**—Business remains in a most uninteresting condition, with nothing whatever doing in this market. Small lots are wanted at about \$24 @ \$24.25, delivered to consumers in the interior, but there are very few that can be worked in at those figures. Lots for shipment are offered at \$23.50, with buyers at \$22.50.

**Scrap Iron.**—The offerings are light, so that prices are maintained at the figures recently quoted, with a fair inquiry for

lots delivered at outside points. Quotations nominally as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—There is a good demand, and with prospects of continued activity, prices are steady at the following discounts: Butt-Welded Black, 55%; Lap-Welded Black, 65%; Butt-Welded Galvanized, 45%; Lap-Welded Galvanized, 55%; Boiler Tubes, 62 1/2 %.

**Nails.**—There is no improvement to notice in this department. It is rumored that the attempt to form an agreement to restrict production has been abandoned, but as about one-third of the mills are idle, stocks are greatly reduced. Prices, however, are demoralized, and for carload lots are quoted all the way from \$1.80 to \$1.85, according to brand. Lots from store of good quality, are held at \$1.90 @ \$2, with a somewhat increasing demand.

## Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, April 15, 1889.

A very quiet week has been experienced in nearly every branch of the Iron trade. The paucity of sales has not been for lack of drumming, but consumers seem to be well supplied for the present and concessions on former prices do not tempt them, especially when the demand for their own productions seems to be declining. The remaining half of the month of April promises to be even quieter than was the first half.

**Pig Iron.**—Transactions have been quite limited since our last report. Sellers of Southern Coke Iron are holding on to this market with grim determination in competition with local Iron, and occasionally capture an order. They seem to have better success in this respect than the representatives of Ohio furnaces. Outside of the Blackbands but a very small quantity of Ohio Iron is now able to reach the yards of Chicago consumers. The demand for Strong Neutral Foundry Pig is growing on the Pacific Coast, and inquiries are being received from that market by Ohio furnacemen. Lake Superior Charcoal is slightly weaker, a low sale of a small lot under special circumstances being used as a lever to depress prices. Cash quotations are as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, \$17 @ \$17.50; Bay View Scotch, \$16.50 @ \$17; Lake Superior Charcoal, all numbers, \$19 @ \$19.50; American Scotch (Blackband), No. 1, \$18.50 @ \$19; Southern Coke, No. 1 Foundry, \$16 @ \$16.25; No. 2 Foundry and No. 1 Soft, \$15.50 @ \$15.75; No. 3 Foundry, \$15 @ \$15.25; Gray Forge and No. 2 Soft, \$14.50; Tennessee Charcoal, No. 1, \$19; No. 2, \$18.

**Bar Iron.**—A little more movement has occurred in the direction of Car Iron, but competition for this business is sharp. None of these orders are very large, however, the most important covering the requirements for but 600 cars. In other channels of consumption business has not been heavy, and prices are barely sustained. Quotations on carload lots of Common Iron from mill still range from 1.60¢ to 1.65¢, half extras, f.o.b. Chicago, with concessions on large orders. Store trade is quite brisk at 1.80¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—There is a continued active demand for Beams in small quantities, but other shapes are quiet. Prices are as last reported.

**Plates, Tubes, &c.**—The boiler-makers are running out of work, and are consequently buying less material, which causes quite a shrinkage in the volume of business. Plate manufacturers are soliciting orders with increased vigor, but they are getting little encouragement in this market. Prices are unchanged.

**Sheet Iron.**—Nothing of special importance has occurred in Black Sheets, mill lots of No. 27 Common for early delivery being quoted at 2.95¢ @ 2.95¢ f.o.b. Chicago, and small lots from store at 3.10¢ @ 3.20¢, with light sales. Some large buyers of Light Sheets, fearing a dispute over wages may cause mills to shut down during the summer, have placed orders for delivery in the latter part of June at 2.85¢, at mill, for No. 27. Galvanized Iron has subsided from its recent active movement into a state of decided dullness, and manufacturers' agents are anxiously looking for orders, with the usual effect of weakening prices. Small lots of Juniata are quoted at 65 % off and Charcoal at 65 % and 2½ % off.

**Merchant Steel.**—Store trade is excellent, but large orders are not looked for until after the 1st of May. Prices continue about the same as previously quoted, an occasional cut being made by manufacturers anxious to get a greater share of current business. The makers of syndicate Steel reduced prices on the 4th inst. ½¢ @ 1¢ on Moldboards, Landsides and Shovel Blades, and ¼¢ on Shares and Slabs, the schedule now being as follows, f.o.b. Pittsburgh, four months, or 3 % off in 30 days, subject to a rebate of ½¢ @ 1¢ upon delivery of the first 10 tons: Slabs, 7¢; Moldboards and Landsides, 7¼¢; Shovel Blades, round or diamond point, 7¼¢; Shares, parallel sides, 7¼¢; ditto, not parallel sides, 9¢; ditto, for Listing Plows, 12¢. Some manufacturers of high-grade Tool Steels have recently advanced their prices with good results. They claim their Steel worth what they ask for it, and their bold action appears to have convinced consumers.

**Steel Rails.**—The North Chicago Rolling Mill Company's works at South Chicago started up again last week, having completed necessary repairs. This is the only Rail mill now in operation in this vicinity, but the prospects are encouraging for the starting of another in a month or two, as orders are accumulating to such an extent that this may be obligatory. A number of small orders were booked, but no large orders were positively secured. Prices are unchanged at \$30 @ \$30.50. The rumor that the projected consolidation of Steel companies had fallen through is untrue. No obstacle to the plan has yet developed, and nothing has happened to cause the least apprehension of such an occurrence.

**Track Supplies.**—Small orders only are in the market, but sellers quote as low prices on them and compete as vigorously for them as though they were very large. Steel Fish Plates are quoted at 1.85¢ @ 1.90¢; Iron Fish Plates, 1.65¢ @ 1.70¢; Railway Spikes, \$2 @ \$2.10; Hex. Nuts, 2.70¢.

**Old Rails and Wheels.**—Prices of Old Iron Rails declined last week, with sale at various rates from \$20.25 down to \$19.75. They are probably worth about \$19.50 at present, although the supply is limited. A lot of several hundred tons of Old Car Wheels was sold at \$18, which seems to be the limit of buyers' bids, although most holders still ask \$19.

**Scrap.**—Free sales of No. 1 Mill Iron have been made to consumers at \$13 @ \$13.50 net ton. Small quantities of No. 1 Forge were also sold at \$18.50, which now seems to be the top of the market. Machinery Cast is quoted at \$12.50 @ \$13, and Stove Plate at \$10. Low-priced Scrap

like Borings and Turnings appears to hold up better than the more costly grades. Mixed Steel has been offered at \$11.50. Dealers are buying stock from railroads now at very low prices, but still quote \$13 @ 13.50 for Mixed Country.

**General Hardware.**—Jobbers report a very fair trade in both Shelf and Heavy Hardware. Summer goods are beginning to move off quite actively, and a heavy demand is promised for Screen Doors, Window Screens, &c. Staple articles are freely called for, but prices are cut very close. In most cases the manufacturers are to blame for this state of affairs. They form combinations to maintain prices on certain lines of goods, and then sell other products in connection with them at less than cost, thus neutralizing the effect of the combination and enabling dealers to compete with them in open markets.

**Nails.**—Prices are not any stiffer than they have been, although jobbers appear to be endeavoring to work their trade into more satisfactory shape. The combination on Steel Nails is being adhered to by the manufacturers, so far as controlling production is concerned, but they are getting uneasy over the slow sale of their product and developments may be expected at any time. Jobbers' quotations are still as follows: Small lots of Steel Nails \$2 and carloads \$1.95; small lots of Wire Nails \$2.40 and carloads \$2.35.

**Barb Wire.**—As far as can be ascertained, all the manufacturers at work are now full of orders and behind in their deliveries, so that prices are somewhat firmer. Buyers are no longer able to dictate terms. Jobbers' prices are a little higher, but it is not expected that they will advance much, as all of them had evidently placed heavy orders when manufacturers were selling at very low rates. Small lots are now quoted at 2.80¢ for Painted and 3.40¢ @ 3.45¢ for Galvanized.

**Pig Lead.**—The situation has improved, partly through the disposition of consumers to take hold at present prices and partly through the withdrawal of offerings by holders, who anticipate better prices in the near future. Sales of 800 tons are reported at about 3.47½¢, with 3.50¢ asked at the close and but limited quantities offered for sale.

**Copper.**—Manufactured Copper holds its own 25¢ rates, but consumers are buying very sparingly. Dealers are carrying light stocks in anticipation of lower prices, of which, however, there is no immediate indication in this market.

Thomas M. Jones, of Jones & Loughlins, who died at Pittsburgh on the 12th inst., was formerly manager of their Chicago branch, occupying the position now held by J. M. Larimer. Mr. Jones was highly esteemed by his associates and his Chicago business acquaintances, who heard of his decease with deep regret.

## Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,  
Pittsburgh, April 16, 1889.

We can chronicle an increasing volume of business in the Iron and Steel trades, but prices do not improve. So many in the business are in urgent need of money that they are obliged to realize on their product at any price, and this accounts in a great measure for the present depression of prices.

The Amalgamated Association of Iron and Steel Workers will ask that all the Iron mills be closed for two months during the summer. This move has been decided upon by a majority of the lodges, and appears to meet with general approbation on the part of Iron workers.

While there is a difference of feeling in regard to the recent attack of Mr. Andrew Carnegie upon the Pennsylvania Railroad, it is generally agreed that the agitation of the matter may be productive of good results. There are a great many people who agree with Mr. Carnegie that this great corporation has not treated Pittsburgh nor the State of Pennsylvania justly nor equitably, and we believe that the discussion of the matter now going on cannot but be productive of good results.

Iron brokers have become very numerous in Pittsburgh within the past few years, and it is complained that the brokerage business is very much overdone. It is said that some of the city furnaces are making it a point to sell direct to consumers, and thereby avoid the brokers as much as possible. However, nearly all the Iron made at other points is being sold through brokers. Among others, the following named parties and firms are engaged here in the brokerage business: Nimick & Co., A. H. Childs, Shearman, Collard & Co., Robinson & Orr, H. E. Collins & Co., J. H. Hillman, H. G. Dravo, W. P. Snyder & Co., T. G. Boyle & Co., F. N. Hoffstott & Co., Preston & Humphreys and J. W. Porter & Son.

**Pig Iron.**—There has been a little more activity during the past week, but with this exception the general situation remains unchanged. Consumers continue to buy as their immediate wants require, and it is evident, therefore, that they are not apprehensive of any immediate advance in price, although furnacemen are not particularly anxious in regard to making additional contracts. Standard brands of Mill Iron may be fairly quoted at \$14.25 @ \$14.50, four months. A broker who had an order to buy a round lot at \$14, cash, after canvassing the field pretty well reports that he was unable to find a seller. We can report a sale of 1000 tons at \$14.25, cash; also 500 tons All-Ore Mill at \$15.50, cash. Foundry Irons continue dull, but prices remain unchanged. Small sales No. 1 at \$16.50 @ \$17, cash, and No. 2 do., at \$15.50 @ \$16. Bessemer Iron is lower, sales of 4000 tons reported at \$16.25, and 1000 tons at \$16.50, both cash. We quote as follows:

Neutral Gray Forge.....	@ \$14.25, cash
All-Ore Mill.....	15.50 @ 16.00, "
White and Mottled.....	13.00 @ 13.50, "
No. 1 Foundry.....	16.50 @ 17.00, "
No. 2 Foundry.....	15.50 @ 16.00, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Cold Blast Charcoal.....	24.00 @ 27.00, "
Bessemer Iron.....	16.25 @ 16.50, "

**Manganese.**—Sales of Ferromanganese reported at \$59.50 @ \$60 for 80 %, and Spiegel at \$28.50 @ \$29 for 20 %.

**Muck Bar.**—There is an increased inquiry, but no improvement in prices. We are advised of sales of some 2000 tons at \$26.50 @ \$26.85, cash. Now that there is a considerably increased demand for Skelp Iron there will be a corresponding improvement in the demand for Muck, as some of the mills making a specialty of Skelp buy considerable quantities of Muck.

**Manufactured Iron.**—The demand for Merchant Iron continues low for the season, but it is improving somewhat, and it is thought will continue to improve as the season becomes more advanced. Some of the mills are pretty fully employed on Skelp Iron, which is still quoted at 1.65¢ for Grooved and 1.90¢ for Sheared. Bar Iron is quoted at 1.65¢ @ 1.75¢, 60 days, 2 % off for cash, according to quality. Old Rail Iron can be had below prices quoted.

**Nails.**—There is a slightly improved demand, but it is chiefly of a local character, and consequently for small lots. Card rates are still adhered to—\$1.90, 60 days, 2 % off for cash for 12d to 40d. Private advices from Wheeling continue to report business very dull there.

**Wrought-Iron Pipe.**—This department of the iron trade continues to improve. Not only are the combination prices being faithfully adhered to, but there is continued inquiry and some of the mills have about all they can do. There has been a decided change for the better since the New York meeting, and it looks now as if there would be a good healthy trade from now until next fall, as new gas and oil fields are being opened up, which will require large quantities of pipe. We continue to quote prices as before: Discounts on Black Butt-Welded Pipe 55 %; on Galvanized do., 47½ %; on Black Lap-Welded, 67½ %; on Galvanized do., 55 %; Boiler Pipes, 62½ % off; Casing, 5¼-inch, 62½ % off; Two-inch Tubing, 18¢ per foot, net; 3-inch Line-Pipe, 20¢; 6-inch do., 53¢; 8-inch, 90¢.

**Old Rails.**—The market continues dull, and prices are weaker. We now quote American Tees at \$22.75 @ \$23, with a sale of 500 tons reported at inside quotations. Old Steel Rails remain as last quoted; sales at \$17.50 for short and \$19 @ \$20 for long lengths. There appears to be more inquiry for Steel than Iron Rails.

**Billets, Blooms, &c.**—Demand continues light, while prices remain unchanged; sales Bessemer Steel Billets reported at \$27 @ \$27.50, cash, at makers' mill; Domestic Bloom and Crop Ends, \$18, cash, at which last sales, reported some weeks ago, were made.

**Steel Rails.**—Heavy Sections are quoted at \$26.50 @ \$27.50, cash, at mill here, according to size of contract, delivery, &c. Carnegie, Phipps & Co. continue to make shipments South and West by river; they have shipped 20,000 tons by river within the past couple of months. The mill of the Allegheny Bessemer Steel Company, at Duquesne, while not so large as some of the others, is claimed to be one of the most complete mills in the country.

**Railway Track Supplies.**—There is more doing, but no change in prices. Spikes, 2¢, 30 days, delivered f.o.b. at works. Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square, and 2.85¢ with Hexagon Nuts. It is thought there will be a considerably improved demand within the next few weeks.

**Old Material.**—The demand continues light, but it is thought there will be an improvement within the next week or two. No change in prices. No. 1 Wrought Scrap, \$19 @ \$19.50, gross; Wrought Turnings, \$18; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14 @ \$14.50, gross; Cast Borings, \$11 @ \$12; Old Wheels, nominal at \$19.

## Cleveland.

CLEVELAND, April 15, 1889.

**Iron Ore.**—There is a steady demand from the furnacemen, but sales during the past week have been confined to comparatively small orders. Additional vessel charters from the upper end of Lake Superior at \$1.25 are reported, and the mine owners claim to have engaged tonnage from Escanaba at 90¢ for six or seven trips. Menominee ore, particularly from the Chapin mine, is in demand at \$5.10 @ \$5.20, f.o.b. vessels Lake Erie ports. Both Champion and Republic Bessemer are commanding \$5.75, and Ores from the Minnesota mines are selling quite freely at the same figure. What is termed the local market has not yet assumed an active phase, particular attention now being paid to the work of encouraging the Eastern trade. Dealers anticipate orders from this quarter aggregating 750,000 tons. Scattering sales of non-Bessemer Ores at \$4.10 @ \$4.20 are reported, but a number of

large transactions are looked for within the next week or 10 days. A considerable quantity of new Ore will arrive from Escanaba on Wednesday or Thursday of this week.

**Pig Iron.**—Slight concessions have been made during the past week in order to enliven the market, and in consequence a few sales can be recorded at prices from 25¢ to 50¢ below current quotations. The furnacemen are restricting their output, and basing their hopes on a revival of activity in May. A small lot of good Foundry Iron is said to have sold for \$16.50, but the transaction forms no basis upon which to base quotations, which are entirely contingent upon the circumstances surrounding the different furnaces. Dealers are unable to give reasons for the present dullness, and are inclined to take a hopeful view of the future.

**Old Rails.**—Prices are again declining, and not over \$21 is being paid for Old American Rails. Other kinds of Scrap are correspondingly depressed.

## Cincinnati.

Office of The Iron Age, Fourth and Main Sts. }  
CINCINNATI, April 15, 1889.

**Pig Iron.**—No new features have been developed in the local market for Pig Iron during the week under review. The volume of business has been light; at least individual orders have been small. A weaker tone has prevailed for all kinds and grades and lower prices have been accepted for Foundry make, but Forge Iron has been better sustained. Producers still persist in the view of a more active business and higher prices during the latter half of the year, and make but little effort to sell for present or near-by delivery. Buyers, on the other hand, believe in lower prices before higher are realized, notwithstanding the fact that the furnaces claim prices are already at the cost point and a number blowing out for repairs will not resume until a decided change for the better is indicated. The poverty of the market is well illustrated in the fact that there has not been a 1000-ton order recorded during the week, and even 500-ton sales have been few. Moderate amounts of No. 1 Southern Coke Foundry have been sold at \$14.75, No. 2 ditto at \$14, and there are reports that even these rates have been shaded. Gray Forge has been apparently well sustained at \$13. Car-wheel Irons have remained slow, with stocks at both Northern and Southern stacks accumulating. The following are the approximate prices current here at the close, for cash, f.o.b.:

Foundry.		
Southern Coke, No. 1 (new classification).....	\$14.75 @	\$15.25
Southern Coke, No. 2 (new classification).....	14.00 @	14.50
Southern Coke, No. 3 (new classification).....	13.50 @	14.00
Ohio Soft Stone Coal, No. 1.....	15.50 @	16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @	15.25
Mahoning and Shenango Valley.....	16.50 @	17.00
Hanging Rock Charcoal, No. 1.....	21.00 @	22.00
Hanging Rock Charcoal, No. 2.....	19.00 @	22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @	18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @	18.00
Forge.		
Strong Neutral Coke.....	13.25 @	13.50
Mottled Neutral Coke.....	12.25 @	12.50
Gray Forge.....	13.00 @	.....
Car-Wheel and Malleable Irons.		
Southern Car-Wheel.....	20.00 @	25.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.50

**Manufactured Iron.**—The trade for Finished Iron has not improved, and an easy tone has continued without essential change in prices.

**Nails.**—There has been an improved demand and a steady market. 12d @ 40d sell at \$1.95 @ \$2 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$2, and Steel Wire Nails at \$2.55 @ \$2.60 per keg.

**Old Material.**—The demand has been light for Old Rails, and an easy tone has prevailed, but there has been no pressure to sell, and prices are quotable at \$20 @ \$20.50 per ton, cash. There has been very little inquiry for Old Wheels, which are nominal at \$18 @ \$18.50, cash, spot.

## Birmingham.

BIRMINGHAM, ALA., April 18, 1889.

Affairs of the Iron market hereabouts remain practically unchanged. There is but moderate selling, and stocks are accumulating at the furnaces. Hope of better things, coupled with the much improved condition and outlook in monetary circles, braces manufacturers generally. Some, however, still complain of the superior freight-rate advantages given by Northern railways to furnaces in that region. Apropos to this subject, at a dinner given this week to Baron Erlanger, of Paris, France, head of the syndicate controlling the Queen and Crescent Railway system, the matter of freight on Iron products was one of the chief topics of conversation. Mr. Thomas A. Mack, manager of the Eureka Furnace, at Oxmoor, controverted a statement that Birmingham had the best of freight rates. The Southern furnaces were at a disadvantage when it came to a question of rates with the furnaces at the North by at least 25 %, and the railroads here have a great deal to do before they will reach near perfection on that score. Some other expressions, giving instances, added force to the suggestions of Mr. Mack. It is realized that while the South, particularly the Birmingham district, has made wonderful strides in Iron manufacture, the market is not here, but at the North, to the consumption of which that of the South is now as a drop to the bucketful. There is, nevertheless, encouragement for the future in the fact that Birmingham is amply provided with railways, most of them of too recent completion to forecast results, though of palpably sufficient importance to inspire confidence and larger investment.

The directors of the Tennessee Coal, Iron and Railroad Company are to visit the district next week to take a view of their property about here, and it is given out that one of the subjects to which they will devote especial attention will be the making of a test of Steel manufactured by the basic process.

The same forces, which of late years, by means of Iron and land companies, have developed property upon which manufactures most notably of Iron materialized, show signs of renewed buoyancy, which will likely result in something fruitful this spring. Another furnace is promised at Attalla, in Etowah County, on the Alabama Great Southern division of the Queen and Crescent system, and the projectors are assured by the people of that road a branch to the coking coal fields of Murphree's Valley, about 40 miles to the west, a little northeast of Birmingham. This same coal is coked by the Birmingham Furnace and Mfg. Company, who have a plant at Trussville, this county. One of their furnaces went into blast this week. The furnaces are each 125 tons capacity. The managers and principal owners are Connellsville, Pa., men. They say the Coke here averages well up with that of Pennsylvania and is in some respects superior. The developing of Coking Coal, while progressing rapidly, has not been equal to the demand, notably for the furnaces and foundries at Sheffield, Florence, Decatur and Gadsden. Foundries and machine shops at New Orleans, and other places ask for contracts larger than can now possibly be met. The early completion of the Birmingham mineral branch of the Louisville and Nashville

Railroad will greatly aid the removal of this embarrassment of manufacturers about here. All the roads touching Birmingham will pursue the same policy as that of the Louisville and Nashville Railroad in reaching out after all mineral properties upon which practical development is taking place. This building of many small new lines has already been of great benefit to Birmingham, and it is confidently believed the near future holds out still greater rewards for labor and capital.

## St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,  
St. Louis, April 15, 1889.

**Pig Iron.**—Extreme quietness prevails. Some few transactions for small lots are being entered from day to day, but even these are fewer than for some weeks past; prices are correspondingly weak. Any prediction as to the future course of the market seems useless, and the general feeling is to accept the situation and await developments. We quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry,	\$15.50 @ \$16.00
Southern Coke, No. 2 Foundry,	15.00 @ 15.25
Southern Coke, No. 3 Foundry,	14.50 @ 14.75
Gray Forge.....	13.50 @ 14.00
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	20.50 @ 21.50

### Missouri.

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

### Tennessee.

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.

**Bar Iron.**—The market shows signs of activity and some fair-sized orders have been booked during the past week. Indications point to a continued improvement, as mills are all busily engaged and have some good-sized orders in view. Prices are a little firmer, but no advance can be noted as yet. For small lots from store we quote 1.80¢, and carload lots 1.60¢ @ 1.70¢, according to circumstances.

**Barb Wire.**—There is a general improvement in the volume of business, and prices are firmer than they have been for some time. The severe competition and low prices which have characterized this department seems to have been withdrawn. Mills that make a specialty of Plain Wire are running full time, and the difference in price between Smooth Wires and Barbed Wires seems wholly inconsistent, as Plain Wire is held at such figures that it is almost impossible apparently for Barb Wire manufacturers to produce stock at any profit, if they pay the prices quoted for Plain Wire. Mills are quoting from \$2.80 to \$2.85 for Painted, and from \$3.40 to \$3.45 for Galvanized. Carload lots are quoted at from \$2.70 to \$2.75 for Painted, and \$3.30 @ \$3.35 for Galvanized, f.o.b. St. Louis.

## Detroit.

WILLIAM F. JARVIS & Co., under date of April 15, 1889, report as follows: Since our last report there has been but little change in the situation here. The market is quite active and the volume of business is above the average for this season of the year. Several large sales of Lake Superior charcoal have been made and in most cases prices have been sustained. Should the demand continue as active for any length of time as it is at present, prices will undoubtedly be advanced. Numerous small orders for Coke Iron have been received and stocks in the hands of small users are very light. In several instances sellers have refused offers a little under figures asked, and it looks as if prices

were likely to range higher instead of lower. We quote for the present as follows:

Lake Superior Charcoal, all num-	\$19.50 @ \$20.00
bers.....	
Lake Superior Coke, all ore.....	18.50 @ 19.00
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.50 @ 19.00
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

## Louisville.

LOUISVILLE, KY., April 16, 1889.

**Pig Iron.**—The market is in a peculiar condition, and it is thought a decided change, either for the better or worse, must take place soon. At present prices furnaces cannot continue to make Iron, and claim that unless a change takes place it will be wise for them to blow out. The sales during the past week show no improvement, and some offerings show a tendency to further decline. Furnaces generally seem willing to make sales for long delivery to customers of undoubted credit. There has not been very much Iron placed during the past week, buyers having bought all they desire. We quote as follows:

Southern Coke, No. 1 Foundry,	\$14.75 @ \$15.25
new classification.....	
Southern Coke, No. 2 Foundry,	14.25 @ 14.75
new classification.....	
Southern Coke, No. 3 Foundry,	13.75 @ 14.25
new classification.....	
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry	16.25 @ 16.75
" No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard	21.75 @ 22.75
brands.....	
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 22.75

Macfarlane & Murdue, Kenyon Building, Louisville, Ky., dealers in Iron, Coal and Coke, announce that they have succeeded to the business of Kent, Macfarlane & Murdue, from which firm C. J. Kent had withdrawn.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street,  
New York, April 17, 1889.

**American Pig.**—Reports from the West are by no means encouraging, the Cincinnati market again showing a declining tendency, with \$14.75 named for No. 1 Southern Foundry. Since the difference between cost of delivery in Cincinnati and in this market is about \$1 ¢ ton, it is evident that there is considerable margin below the parity in prices quoted here. Southern No. 1 has been offering here at \$16.75 @ \$17, without, however, so far as we can learn, securing much business. Reports are again coming to hand that founders are rejecting Southern Irons, which in some instances may be due to the fact that sales agents in their eagerness to do business have adopted the practice of shipping No. 2 instead of No. 1. There are rumors that some of the Lehigh companies are accumulating Iron, and that deliveries on contracts are being delayed. We are informed, however, by the leading company that current shipments are satisfactory. We continue to quote: Northern standard brands, tidewater delivery, \$17.50 @ \$18 for No. 1; \$16.25 @ \$17 for No. 2 Foundry, and \$15 @ \$15.25 for Gray Forge.

**Ferromanganese.**—Importers' quotations vary widely, the difference between the lowest and highest bids for a contract for a few hundred tons having been \$3 ¢ ton. We quote \$56.50 @ \$57 as a close price for 80 ¢ Ferromanganese.

**Wire Rods.**—The market is dull at \$41.25 @ \$41.50 for Foreign.

**Old Rails.**—The only transaction reported is a lot of 500 tons of Double Heads at private terms. The market is weaker, but irregular, with little offering here, and little demand. At other points lower figures are being made, however. Thus, a lot of 500 tons of Tees is being offered at \$21.25 at Buffalo, which is equivalent to about \$22.50 here.

**Track Material.**—Spikes remain dull at \$1.95 @ \$2 ¢ keg delivered, with Angles Bars selling at \$1.75 @ \$1.80 delivered for sound lots.

**Structural Iron and Steel.**—We quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

**Bar Iron.**—We quote: Carload lots on dock, half extras, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Steel Rails.**—Only a moderate amount of business has been done, small sales having been made to Eastern roads aggregating about 1000 tons, while the Manhattan Elevated Road opened bids for 1500 tons to-day. There are a number of bona fide inquiries in the market, aggregating about 20,000 tons, the bulk of them for Southern delivery. We continue to quote \$27 @ \$27.50 for large lots at Eastern mill. The April report of the Board of Control shows aggregate sales of 670,160 tons out of a total allotment of 990,850 tons. Last year up to the same time the sales were 658,513 tons, and in the year 1887 1,494,384 tons. The shipments for the first quarter in 1889 were 244,765 tons, against 184,580 tons in 1888 and 389,532 tons in 1887.

The Moorhead-McCleane Company, W. P. Loughry, agent, 81 John street, have sent out a stock list of Soho C.H.B. Galvanized Sheet Iron, under date of April 13. The exact quantities of Sheets on hand of the different sizes and gauges are given in detail.

## Financial.

Business advices are decidedly more cheerful, perhaps in sympathy with the revival taking place in the world of nature. Agricultural operations appropriate to spring are in full activity through the Northwest, where a large area of wheat lands have been seeded, and prospects for the next harvest are auspicious. The statistics for foreign traffic are also favorable, chiefly on account of the remarkably large exports of cotton, the wheat movement being still on a restricted scale. Wheat prices dropped again about 2¢ ¢ bushel. Corn was lower and pork products had a lower tendency. Sugar advanced ¼¢ on raw and refined, under speculative management. The exhibit of railroad earnings was not particularly flattering, if comparison is made between the last few weeks, meteorologically considered and the embarrassments that hampered transportation a year ago—blizzards and strikes. General trade in this city is dull.

The Stock Exchange market was influenced exclusively by professional managers in the absence of legitimate traders. A further marked decline in Atchison occurred, affecting the investment market as well as the more general list, but Reading, St. Paul and others among the most active stocks advanced, declining, however, at the close. Various movements in the sugar trust were reported and refineries advanced about 15 ¢, to drop off again

on Wednesday to 93½. The railroad bond was particularly active.

New York Sub-Treasury operations for the week included the payment of \$5,045,935 for purchased bonds, by which the associated banks gained \$5,004,616. The statement for the week reports an increase of \$5,481,700 cash. As the disbursements by the Treasury counted in the statement of averages for little more than \$2,000,000, the return movement from the interior must have been much larger. The statement was made up, moreover, on rising averages and the actual condition of the banks is much better than it shows. The contraction of loans was regarded as a healthful sign. The changes resulted in a gain of \$4,655,975 to the surplus reserve, which is now \$6,065,550, against \$10,870,425 a year ago, and \$4,488,650 in the same week in 1887.

Money during the week has got into a better shape, funds being in good supply, principally in consequence of disbursements from the Treasury in the purchase of bonds, amounting to nearly \$10,000,000. The threatened export of specie was averted by easy money in London. Rates for time loans are not materially changed, but were to some extent nominal. A return movement from the interior is not improbable, the recent heavy demand from Southern points having wholly ceased. Sterling exchange continues high, and exports of gold in any amount are not apprehended.

The foreign commerce of New York for the month of March and for the last three months makes a favorable showing compared with last year, but the imports of late indicate no "boom," which many expected would follow the settlement of the Presidential contest. While the total imports for the month amounted to \$40,622,000, against \$40,875,000 last year, the specie item fell off nearly \$2,000,000. The total imports for nine months, exclusive of specie, were \$347,838,815, the largest in the history of the trade with three exceptions. The exports for the month, exclusive of specie, were \$28,859,335, against \$22,843,204 last year and \$28,365,160 in 1887. The increase over last March, \$6,016,131, is covered by the increased exports of domestic produce.

Representatives of the silver mining interests on the Pacific Coast are believed to have had an interview with Secretary Windom much less satisfactory than they had hoped for. Senator Stewart, of Nevada, would have the present output of silver coin increased to \$4,000,000 a month, as a way of reducing the Treasury surplus, but the Secretary was unable to see how a mere conversion of gold, greenbacks, &c., into silver would effect this result. It would rather aggravate the evil complained of. More likely the Treasury policy of the last three Administrations would be adhered to for the present; at least until President Harrison's views are better known.

## Metal Market.

**Copper.**—London declined for the week from £39. 15/ spot, to £37. 5/ and futures from £39. 10/ to £37. 10/, sales summing up the large amount of 2675 tons. In their monthly report of April 1 Messrs. James Lewis & Son, Liverpool, expressed themselves as follows: "So far as the mining companies are concerned, they have been able to pay their shareholders very large dividends for 12 months, which will be some set-off to the greatly reduced dividends they are now earning. That it is the interest of these companies to agree to reduce their production until it has been overtaken by consumption is clear. The difference between the price obtained by the three Spanish companies, under their contract with the *Société des Métaux*, of

£70 per ton for Best Selected, and the present value of £45 per ton, represents upon their last year's production of about 50,000 tons a difference of £1,250,000. A reduced production and higher price would considerably diminish this loss; whereas, if production is not decreased by these and other large companies Copper will probably fall to £35 per ton for Best Selected, representing to them a further loss of £500,000. Representatives of 90% of the American production are now in Paris, and it is possible that advantage may be taken of this to endeavor to arrange some means for supporting the market and gradually realizing the large quantities of Copper in the hands of French and other banks and banking firms without ruinously sacrificing them. To accomplish this end it will be necessary that the present holders of the large stocks of Copper here, in France and in the United States should work in unison with the larger producers." The ensuing cablegram was received from London April 13: "The liquidator of the Comptoir d'Escompte, of Paris, will arrive in this city on April 15 for the purpose of opening negotiations whose object is to obtain the canceling of contracts between the Comptoir d'Escompte and the English copper mining companies." Nothing has transpired since with reference to the result of negotiations on the other side on the part of the American mining companies. A cablegram this morning states that prospects in this respect remain cloudy. On the 15th inst. the visible supply of Copper in England and France had reached the unprecedented aggregate of 126,720 tons. During the first quarter Liverpool and Swansea imported 8610 tons of American Copper, against 6789 in 1888. It is stated that the Lake companies are delivering to consumers on this side whatever Copper they may want for their current requirements with the understanding that the price is to be that of the next pool sale. At Philadelphia casting brands changed hands at 12½¢ in the meantime. The following was received from Boston: "April 13, 1889.—The directors of the Boston and Montana Mining Company to-day declared a dividend of \$1 per share to stockholders of record April 29. They also direct that a special meeting of the stockholders should be called, notice of time and place of which will be duly given later, to authorize the issuing of a general mortgage of \$500,000, to provide the means for the company to build itself an adequate smelting plant, which they not only recommend but deem absolutely necessary. They think that the proceeds of these bonds and the profits of the mine will pay for the completion of the new smelting plant and enable the company to pay dividends of at least \$4 per share per annum. The saving made in the cost of Copper by the erection of the smelting plant, it is estimated, will pay the cost of the entire works in less than two years. Mr. Jere Abbott resigned and Mr. A. W. Spencer was chosen a director in his place." "April 16.—There are some hints of inside support of Boston and Montana, which holds at 31½, but it is realized that on a dividend basis of \$4 per year it will return 12½% to the purchaser at present prices. Hence it is likely to hold above 30, unless further bad news is received about the Copper situation. It looks now like a 10¢ per ton market again."

**Tin.**—There was a decline in the London market during the week from £92. 12/8, spot, to £91. 15/ yesterday, and in futures from £93. 10/ to £92. 15/, sales aggregating 860 tons. Here there were sold 10 tons May, 20 tons June and 10 tons July at 20.70¢; 75 tons July at 20.85¢, and 25 tons August and 25 September at 20.90¢, subsequently 20 tons spot and 20 tons May at 20.67½¢; 10 tons July at

20.65¢ and 15 September at 20.75¢. Messrs. Gilfillan, Wood & Co., Singapore, write, under date March 12: "This month's export of Tin will be moderate, and it is expected that the arrivals for some time will be on a more moderate scale than they have been of late." During the first two months the Straits Settlements exported to the United States 22,230 piculs Tin, against 1888, 9846; 1887, 12,866; 1886, 14,715; 1885, 4205; and 1884, 9841. Spot Tin closes at 20½¢ @ 21¢. **Tin Plates.**—A resumption of activity has been checked by the stiff attitude of importers and the continued high prices demanded by most makers. At the late Birmingham meeting the makers talked as though they all felt very strong, but since then several of them have modified their views and begun to name special prices in order to induce fresh orders. We quote, large lines, ordinary brands, per box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.75; Terns, \$4.12 @ \$4.30; Coke Tins, \$4.30 @ \$4.40, and Wasters \$4.15 @ \$4.20.

**Lead.**—Toward the close of last week some 400 tons Common Domestic were sold at 3.70¢ for June, most of it, some being May delivery at 3.72½. As refiners wished to check the advancing tendency they put 50 tons on the market and sold them at 3.65¢, but it was of no avail, the market rallying since to 3.70¢ asked and 3.67½¢ bid, at which it closes strong. The Western markets are firm at 3.40¢ @ 3.45¢.

**Spelter.**—Has remained featureless at 4.65¢ @ 4.70¢ for Common Domestic, with only a small business transacting, while Silesian continues to be held nominally at 5.50. @ 5.62½.

**Antimony.**—A good consumptive demand has been noticeable at 12¢ @ 12½¢ Hallett's and 13½¢ Cookson's.

## New York Metal Exchange.

The following sales are reported:

THURSDAY, April 11.

200 tons Lead, May..... 3.97½¢

FRIDAY, April 12.

16 tons Lead, May..... 3.70¢  
25 tons Tin, July..... 20.85¢  
25 tons Tin, July..... 20.90¢  
25 tons Tin, August..... 20.90¢  
25 tons Tin, September..... 20.90¢  
25 tons Tin, July..... 20.80¢  
10 tons Tin, May..... 20.70¢  
20 tons Tin, June..... 20.70¢  
10 tons Tin, July..... 20.70¢

SATURDAY, April 13.

10 tons Tin, spot..... 20.70¢  
10 tons Tin, May..... 20.65¢  
10 tons Tin, spot..... 20.65¢

MONDAY, April 15.

10 tons Tin, May..... 20.70¢  
15 tons Tin, September..... 20.75¢

TUESDAY, April 16.

10 tons Tin, July..... 20.65¢

WEDNESDAY, April 17.

10 tons Tin, September..... 20.75¢  
38 tons Lead, June..... 3.70¢

A special to the Metal Exchange, from London announces that L. Lazarus & Son have bought nearly 1000 tons of Copper this morning, but the market is generally selling. Prospects for a combination of the mining companies are very cloudy, and a new pool very doubtful. No positive information obtainable as yet regarding result of negotiations.

## Coal Market.

The Anthracite Coal market continues to be dull and weak. Although this is usually the unfavorable season, it has proved to be more so this year than ever before, for reasons to which we have already alluded. The inquiries are chiefly for the smaller steam sizes, and it is therefore only Pea and Buckwheat Coal which are in good demand. The new rates of toll went into effect on the 15th. Prices may be quoted as follows, the lower figures

being made by individual operators: Broken, \$3.50 @ \$4; Egg, \$3.75 @ \$4; Stove and Chestnut, \$3.75 @ \$4; Pea, \$2.50 @ \$3. The Chicago Bureau of Anthracite Coal statistics reports the receipts for the first quarter 45,381 tons, and the stock on hand 461,359 tons, a total of 506,740 tons, as compared with 332,416 tons in 1888, an increase of 184,324. For the week ending April 7 the output was 503,582 tons. The Reading Company have suspended operations two days last week, and will stop the two last days of this week and Monday of next week. This, it is hoped, will somewhat aid the market.

The Bituminous Coal trade is quiet, although relatively in a better condition than the Anthracite market. Prices are quoted: \$2.25 @ \$2.40, f.o.b., Baltimore, and \$3.25 @ \$3.50, alongside, New York. Some contracts have been placed in the New England market.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, April 17, 1889.

Copper has been active during the week. Large buying orders for Merchant Bars were received and executed prior to Friday, and for a time the market looked like recovering. Subsequently a heavy quantity was pressed for sale, and weakened the market greatly, resulting finally in sales at £37, cash, or 40/ decline from the highest point of the week. The fact has been disclosed that the Spanish Mining Company have delivered to the Société des Métaux three times the quantity of Copper stipulated for in the original contract. It is also said that the Mason & Barry Company will soon begin legal proceedings against the Société. Matters are in so complicated a condition that there seems now to be very little chance of producers and holders coming to an agreement. Consumers are now buying below the level intended by the negotiator, and manifest no inclination to deviate from their present course. It is announced that the quantity of Copper under the control of the Comptoir d'Escompte was 170,000 tons, distributed among 11 banks, two of which have realized. The mines of the Caradon Company have been closed, and will remain so until the market is in better shape. Best Selected Copper is scarce, except at comparatively high prices, as the companies are not free to sell. The price is now, nominally, £45, against £37 for Merchant Copper.

Tin Plate makers booked heavily at the quarterly meeting, and are very firm on prices, despite the present heavy production and accumulation of stocks at the shipping ports. The total stock is now about 351,000 boxes, against 248,000 boxes the corresponding period last year. The project of the formation of a syndicate to regulate prices and production has been revived. The proposition provides for curtailing the make and advancing prices about 1/ per box.

Pig Iron warrants have declined sharply, Scotch selling to 43/11, Middlesboro' to 38/6, and Hematites to 49/, under the effect of pressure from the "bears." Outsiders have been operating freely, and their purchases give the market some support. In makers' brands trade has been quite brisk, but the course of warrants has somewhat

adversely affected prices. Manufactured Iron continues active, and prices are very firm.

Foundry Pig has advanced to 57 marks in the German market.

There is more old material offering in this market, and prices are somewhat irregular, and rather too high for business on a liberal scale.

In the Steel department there is considerable activity, more particularly in Rails and Billets, prices for which continue strong.

Scotch Pig.—Business fairly active, but prices a shade lower on most brands.

No. 1 Costness, f.o.b. Glasgow	56/
No. 1 Summerlee, " "	56/3
No. 1 Gartsherrie, " "	58/
No. 1 Langloan, " "	55/3
No. 1 Carnbroe, " "	48/
No. 1 Shotts, " at Leith	58/
No. 1 Glengarnock, " Ardrossan	52/
No. 1 Dalmeilington, " "	46/6
No. 1 Eglinton, " "	45/

Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.

Cleveland Pig.—Less doing in this line and the market not so firm. No. 3 Middlesborough, G.M.B., 38/6 @ 39/ prompt.

Bessemer Pig.—There has been a large business at somewhat lower prices. West Coast brands, mixed numbers, 49/ @ 49/6, f.o.b. shipping point.

Spiegeleisen.—A fairly good demand and prices firmly held. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—The demand continues quite active and makers' prices firm. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

Steel Blooms.—A quite good trade in these at firm prices. We quote £3. 19/3 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Higher prices are quoted and the market continues active. Bessemer, 2½ x 2½ inch, £4. 7/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—The demand moderate and prices held firmly. Bessemer, £3. 19/6, f.o.b. at N. W. England shipping point.

Old Rails.—Business slow and buyers and sellers apart on prices. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

Scrap Iron.—No improvement in the demand. Prices barely steady. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Sales moderate and at unchanged prices. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

Tin Plate.—Business has been fairly active at generally firm prices. We quote, f.o.b. Liverpool:

1C Charcoal, Allaway grade	15/3 @ 15/9
1C Bessemer Steel, Coke finish	13/6 @ 14/
1C Siemens " "	14/ @ 14/6
1C Coke, B. V. grade	13/ @ 13/3
Charcoal Terne, Dean grade	12/6 @ 13/

Manufactured Iron.—There is still a brisk business in this department and prices are very firm. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
" Common	"	@ 8 2 6
Staff. Bl'k Sheet, singles	7 12 6	@ 5 17 6
Welsh Bars (f.o.b. Wales)	5 2 6	@ 5 5 0

Copper.—The market quieter at the close and weak. To-day's prices were: Bars, £37 for spot; £37 @ £37. 5/ for three months' futures. Best Selected, £45.

Tin.—A fairly active business at the decline, closing firmer. Straits sold at £91. 10/, spot, and £92. 5/ for three months' futures, reacting 10/ @ 15/.

Lead.—The demand fair and prices very steady. Quoted at £12. 12/6 @ £12. 15/ for Soft Spanish.

Spelter.—More activity in this metal and prices firmer. Quoted at £17. 10/ for ordinary Silesian.

## Foreign Markets.

### EQUIVALENTS.

	Cents.
Franc, Peseta or Lira	19.3
Florin (Netherlands)	40.2
Florin (Austria)	35.9

### WEST INDIES.

PORT OF SPAIN, TRINIDAD, March 15, 1889.—**Asphaltum.**—There has been increased activity in purchases for export at \$14.04 per ton Boiled, inclusive of export duty, free on board, and \$6.84 Crude. Shipments since January 1 sum up 12,432 tons, against 10,568 and 3523 respectively same time in 1888 and 1887. **Exchange.**—Ninety days' sight on London \$4.74 @ \$4.80.—E. P. Masson.

### CHILI.

VALPARAISO, February 15, 1889.—**Copper.**—In view of the drooping tendency in London sales have been restricted to 19,713 quintals at \$23, which at 29½d exchange equals cost and freight £68. 18/4 in England. **Coal.**—Shipments from England are decreasing, and Newcastle now commands 37/ on the spot and 40/ afloat, while Australian may be had at 25/ @ 27/6. **Exchange** closes at 29½d for 90 days' sight drafts.—Weber & Co.

### EAST INDIES.

MANILA, April 8, 1889.—**Hemp.**—There are buyers at \$14 per picul, against \$8.12½ same date last year, equalling per ton cost and freight £48, against £29. 5/; clearances for the United States since last cable have amounted to 15,000 bales, against none last year; since January 1 there were 105,000 bales, against 43,000; loading for ditto, none, against 20,000; cleared for England since January 1, 79,000, against 104,000; loading for ditto, 9000, against 4000; cleared for all other ports, 10,000, against 20,000. Receipts at all ports since last cable, 11,000, against 5000; ditto since January 1, 186,000 bales, against 157,000 in 1888 and 123,000 in 1887. **Freight,** \$7.50, against \$5. **Exchange,** six months' sight, 3/7, against 3/8½.—Ker & Co., per cable direct to their agent, Mr. Charles Nordhaus, 89 Water street, New York.

### SOUTH AFRICA.

PETRORIA, Transvaal, March 1, 1889.—**Gold.**—It is difficult to ascertain even approximately the actual gold production in South Africa, as so much of it leaves the country in the hands of private persons. The only positive figures are furnished by the official returns of exports at Natal and ports of the Cape Colony. These have been as follows:

1870 to 1880	£324,666
1881	£17,952
1882	22,040
1883	30,457
1884	39,005
1885	£69,543
1886	134,709
1887	235,937
1888	880,464
Total	£109,454
Total	£1,320,653

The increase during the past four years has, according to these figures, been more than twelvefold, the Transvaal furnishing the bulk, and the outlook being more promising than ever this year.—Argus.

### SWEDEN.

STOCKHOLM, April 4, 1889.—**Iron Ore.**—Ore shipments have had to be suspended till now, as the Gellivara-Otten Railway was not in running order, owing to the snow blockades, but four trains of Ore now arrive at Lulea daily, where 40,000 tons are awaiting steamers to load the same. As soon as navigation opens, great activity will prevail.—*Dayblad.*

### SPAIN.

BILBOA, March 30, 1889.—**Iron Ore.**—Orders continue flocking in from all the chief Iron manufacturing regions in Western Europe, and the activity on the spot and "to arrive" causes

great stiffness in the value of Ores, which tend upward. There has been no difficulty in obtaining 8/4 @ 8/8 for Rubios, and 7/2 @ 7/5 for Campinil; the former is, moreover, scarce, and will be more so after a while. The output is under control of but a few mining concerns. Shipments since January 1 amount to 1,009,592 tons, against 990,386 same time last year. Pig Iron is dull, and only 1050 tons went coastwise during the week.—*Bilboa Marítimo y Comercial*.

## HOLLAND.

ROTTERDAM, April 4, 1889.—*Tin*.—Since the beginning of the month there has been an improved tendency, 57.12½ guilders @ 100 kg. now being offered for both Banca and Billiton on the spot. Following are the March statistics in Holland:

Banca.	1889. Slabs.	1888. Slabs.	1887. Slabs.
April 1. Company's stock on warrants at Amsterdam.....	19,361	19,413	14,828
April 1. Company's stock on warrants at Rotterdam.....	22,298	24,042	14,740
Totals.....	41,659	43,455	29,568
Billiton stock in Holland.....	22,483	30,008	23,070
Totals.....	64,142	73,463	52,638
March deliveries of Banca.....	11,550	11,400	9,826
March deliveries of Billiton.....	5,705	1,913	8,992
Total deliveries.....	17,255	13,313	18,818
Banca afloat.....	7,200	12,800	11,200
Stock in Company's hands awaiting coming auctions.....	137,285	90,436	52,227
Billiton afloat.....	39,260	34,950	24,300
Price of Banca, fl.....	56¾	98	61¾
Price of Billiton, fl.....	56¾	101¼	61¾

—Koch &amp; Vlierboom.

## BELGIUM.

BRUSSELS, April 6, 1889.—*Iron*.—The Belgian iron markets remain firm throughout; Foundry Pig continues tending upward. We quote to-day in francs @ 100 kg.: Luxembourg Foundry, 5.10 @ 5.20; Charleroi do., 6.50; do., Forge 4.80 @ 5.80; Luxembourg do., 4.80 @ 4.90. Beams were partially affected by French competition, but have righted again under a brisk export demand, and all makers are busy. Plates and Sheets are scarce; the advance obtained is therefore justified. All Structural works are fully booked. The demand for building purposes is brisk. Railroad Material is also moving off satisfactorily. The proposed removal of the import duty on Pig Iron will benefit the Longwy French blast furnaces more than any other. Luxembourg Foundry Pig will also derive advantages from it. We quote Merchant @ 100 kg.: Nos. 1 to 3, 12.50 @ 14.50; do. at Antwerp, 12 @ 13.50; Beams, 11.75 @ 12; Angles, 13 @ 14.25, and Sheets, 16 @ 25.—*Moniteur des Intérêts Matériels*.

Reports indicate that the Amalgamated Association of Iron Workers propose to ask that the iron mills be closed down for two months during the summer, just as the glass factories.

It is reported that the Heckschers, who are interested in the Bethlehem Zinc Works, have acquired by purchase a zinc works at Japlin, Mo.

Bolckow, Vaughn & Co., of Middlesborough, have introduced in their mills a simple device for increasing the life of rolls. Breaks of large rolls are apt to occur after the mill has been idle for some time, notably on Mondays, because the passage of hot metal through the cold rolls causes strains which lead to fracture. Bolckow, Vaughn & Co. have aimed to avoid this by slowly and uniformly heating the rolls before beginning work. This is done by a series of gas jets arranged on both sides of the rolls level with the necks. The gas pipe is attached to the journal so that it can move up and down with it. After lighting the gas jets the rolls are slowly turned, thus heating them uni-

formly. It is reported that in one English mill the life of rolls increased from 79 days to 342 days, and in another mill a set of 36-inch rolls seven feet long, which had been used for 342 days, broke as soon as previous heating was suspended.

## The Phonopore.

Some two years since the London *Times* called attention to an important advance made in electric science by C. Langdon-Davies. This referred to the invention of the phonopore, an instrument by means of which electrical effects are produced under conditions which had previously been thought to make them impossible. At that time were recorded the results of a demonstration of the practical working of the system in connection with the telegraph line between London Bridge and Folkstone. Since then improvements have been made and the system perfected. For some months past a practical test has been made upon a telegraph line on the Midland Railway.

In order to render a description of the experiments and their results clear, says the *Times*, it will be necessary at the outset to describe briefly the nature of the invention. And here we must first refer to the well-known fact that, if a telephone be inserted in a wire situated near to a line of telegraph wires, every passing current will produce noises in the telephone, notwithstanding that the telephone wire be perfectly insulated from the telegraph wires. These noises are known as induction noises, and it was while investigating the phenomena of induction with the view of devising means to obviate its effects in telephones that Mr. Langdon-Davies made the discovery which has led to the important results under consideration. His investigations led him to the conclusion that induction was caused by some form of electrical force, which might be separated from currents, and which would pass freely through insulations impassible by currents. He further concluded that if this were so a new series of instruments might be constructed for the utilization of this force, and capable of being put in operation in company with current instruments on the same wire. His conclusions have been proved to be perfectly correct by what has since resulted from the development of the principle. Instruments have been made which represent a system of communication of the highest practical utility, and by means of which Mr. Langdon-Davies has added a distinct and independent chapter to the history of electrical development. The only form of electrical force which finds free passage through these instruments appears to be always capable of being associated with sound. The inventor has therefore denominated the force "phonoporic impulse," and the instrument the "phonopore."

It is certainly very remarkable, and to some it may appear almost incredible, that phonoporic messages can be transmitted and received through an ordinary line wire by the phonopore, while at the same time telegraphic messages are being transmitted and received through the same wire by the ordinary telegraphic apparatus. No less remarkable is it, but it is no less a fact, that the phonoporic instruments have no conducting circuit through them. The phonopore gives uninterrupted passage to electrical effects capable of being associated with sound, although it does not permit the passage of electric currents. Externally the phonoporic transmitter resembles an ordinary Morse key, mounted on a base about 4 inches high, containing an instrument somewhat similar to an induction coil. The impulses are generated in a specially-constructed primary circuit, over which is

wound, in place of a secondary circuit, a phonopore, consisting of two wires insulated from each other throughout their whole length and at both ends. Each of these wires, however, is connected at one end to the line. The number of phonoporic impulses generated per second in the transmitter is regulated by the vibrations of an organ reed placed in the primary circuit. Another reed tuned to the same rate of vibration is placed as a receiver at the distant station in front of an electromagnet, and the phonoporic impulses from the transmitter cause it to vibrate. A special form of contact-breaker, operated by the receiver reed, completes a local relay when the reed is still, but breaks it whenever the reed vibrates at its proper rate, thereby setting in action any required instrument in connection with any battery. Divested of its technical surroundings, the phonopore presents itself as a small and simple apparatus, consisting only of a pair of insulated copper wires.

We now turn to its practical application, and to make this clear we will suppose that an ordinary telegraph line from one town to another is provided at each end with the usual telegraph instruments, and that, owing to increase of business, it becomes necessary to provide some additional means of communication. All that is now necessary is to attach to the line at each end a phonopore, without in any way altering the existing instruments, batteries or line. The phonopore can be worked at the same time as the ordinary telegraph instruments, and one is thus made to do the work of two. If the line is already duplexed by ordinary duplex telegraph instruments, the addition of the phonopore will quadruple it. If the line is—as a few trunk lines are—quadruplexed, the phonoporic instruments will "sextuplex" or "octuplex" it. Indeed, it would seem difficult at present to assign any limit to the multiplex carrying capacity of the new system. Upon the artificial line which Mr. Langdon-Davies has set up in his laboratory messages were transmitted at the recent demonstration, first, by the ordinary telegraph instruments alone, and, secondly, by a phonoporic instrument alone. In the next place the ordinary telegraph instrument and the phonopore were worked together in opposite directions duplex, after which the ordinary instruments and the phonopore were worked together in the same direction duplex. The final experiment consisted in the ordinary telegraph and both the phonopore telegraphs being worked together simultaneously through the single line. The three messages were perfectly transmitted, although some of the operators had not previously used the phonoporic instruments. These experiments proved not only the complete possibility of simultaneous working, but that the phonopore can be arranged to work ordinary telegraph instruments, and that when used in duplex or quadruplex work it requires no special regulating or balancing. They also proved that any wire already provided with an ordinary service can instantly be duplexed by merely attaching the phonopore instruments. On a second artificial line there were installed two harmonic phonopore sounder telegraphs, constituting a duplex service without any arrangement whatever to balance the lines, and working through a resistance equivalent to that of about 6000 miles of telegraph wire. Messages were perfectly transmitted through this line in both directions at the same time.

The coal rates within the 40-mile radius from Pittsburgh to Mahoning and Shengango Valley points have been fixed at 60 cents, a reduction of 10 cents from the old rate. The new rates went into effect on Monday, the 15th inst.

# Hardware.

There is a moderate movement in trade in this market, and while in some jobbing centers a good business is reported, there is general complaint on the part of manufacturers and merchants that trade is not up to anticipations. Purchasers are confining their orders to near requirements, and have a good deal of distrust as to the course of the market, recognizing its lack of strength, and notwithstanding that prices are admitted to be very low, apprehending a further shrinkage. There are, however, few changes to note. Most lines of staple seasonable specialties are in good demand. Collections are rather slow.

## Cut Nails.

The volume of business is increasing and the market is steadier, so that the reports of shading \$1.80 on dock for car-load lots for standard Iron Nails are growing less frequent. The agreement of the Eastern Nail manufacturers is still going the rounds. While the movement is regarded as affording much promise by the great majority of the mills, it is only fair to state that a few are not very sanguine as to the outcome, and some question the wisdom of giving a new lease of life to weaker concerns.

James M. Swank, General Manager of the American Iron and Steel Association, has just published the following statistics of the

### PRODUCTION OF IRON AND STEEL CUT NAILS:

Our statistics of the production of Iron and Steel Cut Nails and Cut Spikes in the United States do not embrace Railroad and other Spikes made from Bar Iron, Wire Nails of any size, or machine-made Horse shoe Nails. For the sake of brevity we shall make no further reference to Cut Spikes, treating them as Nails.

Our total production of Cut Nails in 1888 was 6,493,591 kegs of 100 pounds each, against 6,908,870 kegs in 1887, 8,160,973 kegs in 1886, 6,696,815 kegs in 1885 and 7,581,379 kegs in 1884. The production of 1888 was the largest the country has ever attained. The decrease in the production of Cut Nails in the last two years has been mainly due to the increased competition of Wire Nails. In 1886 the production of Wire Nails was about 600,000 kegs, made by 27 Wire-Nail works; in 1887 the production was estimated to have been 1,250,000 kegs, made by 47 works; and in 1888 the production is estimated to have been 1,500,000 kegs, or 150 per cent. more than in 1886. The smaller sizes of Wire Nails are those which have heretofore chiefly competed with Cut Nails, but all sizes Wire Nails are now in general use.

Twelve States made Cut Nails in 1888:

States.	1888—Kegs of 100 pounds.			Total 1887. Kegs.	Total 1888. Kegs.
	Iron.	Steel.	Total.		
Penn.	1,061,938	1,021,031	2,072,969	2,238,165	2,569,237
Ohio.	128,101	1,369,850	1,522,951	1,672,128	1,703,790
W. Va.	213	1,144,968	1,145,151	827,325	869,600
Ind.	97,476	77,521	175,397	369,040	389,922

The rapid displacement of Iron Nails by Steel Nails which has been noticed during

the last few years was continued in 1888, about two-thirds of the total production of Cut Nails in that year being made of steel. In 1884 the production of Steel Nails in the United States (including 500 kegs of combined Iron and Steel) was only 393,482 kegs, or 5 per cent. of the total production. In 1885 the production of Steel and combined Iron and Steel Nails was 1,823,127 kegs, or 27 per cent. of the total production. In 1886 the production of Steel Nails alone was 2,968,989 kegs, or 36 per cent. of the total production. In 1887 the quantity of Steel Nails produced exceeded that of Iron Nails, being over 50 per cent. of the total production; and in 1888 the Steel Nails made amounted to over 66 per cent. of the total production. California made 215,000 kegs of combined Iron and Steel Nails in 1888, and Massachusetts made 3577 kegs. We have classed these in the table with Iron Nails.

The leading Cut-Nail producing district of the United States is known as the Wheeling district. It embraces four counties, all bordering on the Ohio River—Ohio and Marshall counties in West Virginia, in which counties all the nail works of the State are located, and Belmont and Jefferson counties across the river in Ohio, the city of Wheeling being near the center of the district. A widely extended section of Central Pennsylvania, embracing 11 counties drained by the Susquehanna River and its branches, has for several years constituted the next most important Cut-Nail district of the country. Many years ago, however, Allegheny County, Pa., was the leading district in the country, but it has now fallen far behind. The following table shows the production in kegs of Iron and Steel Cut Nails in all these districts in the last five years.

Dist.	1884.	1885.	1886.	1887.	1888.
Wheeling...	1,991,570	1,297,136	1,858,551	1,848,116	2,187,845
Central Penn.	1,063,996	1,472,797	1,489,482	1,222,400	1,109,377
Alleghy Co., Pa.	459,512	176,258	121,441	277,410	232,762

The decline in the Wheeling district in 1885 was due to a prolonged strike, which benefited the Central Pennsylvania district.

## Miscellaneous Prices.

The Freezers made by the Gooch Freezer Company, Cincinnati, Ohio, are sold at the following discounts:

	Discount.
Peerless.....	60&10 %
Giant.....	60&10 %
Zero.....	65&10 %
Pet.....	65&10 %
Boss.....	65, 10&10 %

The D. M. Steward Mfg. Company, Chattanooga, Tenn., issue circulars relating to their Metal-Workers' Crayons, Rolling-Mill Crayons, &c. These goods, in case lots, are sold at the following prices, subject to a discount of 25 per cent.:

	Per gross.
Metal-Workers' Crayons.....	\$2.50
Rolling-Mill Crayons.....	2.50

On five-case lots or more a special discount is made.

The Gibbs Lawn Rake Company, Canton, Ohio, quote their Lawn Rakes and Post-Hole Diggers at the following prices: Gibbs Lawn Rakes, discount 50 and 15 per cent.; Canton Lawn Rakes, discount 50 and 10 per cent.; Gibbs Post-Hole Diggers, \$30 per dozen, subject to a discount of 50 per cent.; Imperial Post-Hole Diggers, subject to a discount of 45 per cent. The company report that their sales to date are in excess of last season, which, considering the slowness of trade, is regarded as indicating the favor with which they are received by the trade.

The following are the prices of the Economy Ice-Cream Freezer, manufactured by the Kingery Mfg. Company, Cin-

cinnati, Ohio, for whom the Alford & Berkele Company are special agents, 77 Chambers street, New York:

	Per dozen.
2 Quart.....	\$10.56
3 Quart.....	12.60
4 Quart.....	13.80

Referring to the business of the present year, a leading Pittsburgh jobber writes as follows:

Our volume of business the first quarter of 1889 is much larger than it was the corresponding period of last year. Prices are lower than I have ever known them in almost everything in our line of goods. Manufacturers of Nails and many other lines of Hardware can only be running their works at a loss. Even at loss they are obliged to run, for the loss would be great to shut down. Their trademust be held, and idle machinery depreciates as much as that which is worked.

Granite and Agate Ware are still sold to a considerable extent from the old list, the new list not having yet come into general use.

## Obituary.

George H. Churchill, of the Hardware firm of Clark, Churchill & Co., Bloomington, Ill., died April 3. He had been sick for a few days, but was not considered dangerously ill until within a few moments of his death. At noon on the preceding Sunday he was taken ill with what the physicians pronounced diphtheria, but though kept from his business he was able to be about the house. He was 37 years of age and was a native of Portland, N. Y., and for six years a resident of Bloomington. He is referred to as among the promising merchants of his city, with many of the qualities that go to make a successful man, and the manner in which he is referred to indicates the esteem in which he was held.

## Items.

Morley Bros., East Saginaw, Mich., have issued a large and imposing catalogue representing the varied lines which they are offering as jobbers and manufacturers. It is a volume of more than 1000 pages, clearly printed, well arranged and strongly bound, making a serviceable catalogue which will be appreciated by their customers. The title page is engraved and represents the different buildings occupied by the business of the house, including the stores, factory and warehouse. It is evident that in the arrangement of this volume the effort has been made, and successfully, to secure the display of a large variety of goods in as small a space as is consistent with their suitable representation and the full descriptive matter. It is also to be noticed that the line of goods represented in the volume is very large, including in addition to the regular line of Hardware, Tools, House-Furnishing Goods, &c., a line of Wooden-Ware, Tinware, Harness, Saddlery Hardware and Whips, Paints, Oils, &c., Electrical Supplies, Brushes, Showcases and other goods of interest to the trade. In the department devoted to the goods manufactured by them the Blue Line Lumbering Tools, Ox Yokes, Ox Bows, &c., are given a prominent place, while their Railroad Stepladders are also illustrated and their construction shown. A pleasant effect is produced by the introduction of colored labels, as on Axes, and the bronze finish applied to other goods, thus giving a touch of color, which adds to the attractiveness of the volume. In nearly all cases list prices are given on the goods, the lists being carefully revised up to date. The volume closes with a number of tables in regard to staple goods, giving the weight, number, thickness, &c., and other useful information. It is a valuable addition to the Hardware trade literature.

The Hulbert Fence and Wire Company, St. Louis, Mo., have issued catalogue No. 12 for 1889, and in it show an enlarged

line of Wire Goods, of which illustrations are given with appropriate descriptions and list prices.

The Samuel Winslow Skate Mfg. Company, Worcester, Mass., issue a circular describing the Vineyard Bicycle, of which illustrations are given, with a statement of its special features.

Hubbard & Co., Pittsburgh, Pa., announce that the destruction of their works in Pittsburgh on the 7th inst. will not prevent the prompt execution of orders for Axes and Hoes, provided they are furnished with specifications immediately, the large capacity of their Beaver Falls works having been increased to meet all demands for these lines. On Saws and Shovels they will, however, be temporarily suspended.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., under date April 2, have issued their catalogue No. 102, devoted to goods connected with summer sports. To this interesting line 48 pages are devoted, with copious illustrations and list prices.

C. E. Hudson, Leominster, Mass., advises us that he has recently made arrangements with three large wholesale houses in Canada—Haverhill, Learmont & Co., and Benny, McPherson & Co., of Montreal, and Wood & Leggat, of Hamilton, Ont.—to have the entire sale of his Rocking Table and Little Star Apple Parers in that country the present year, and has already received orders from them for about 1000 dozen machines. He advises us that he will fill no orders from other parties there this season.

R. Hoe & Co., New York, have issued their Saw catalogue for 1889, in which special attention is given to their Chisel-Tooth Saws, the special features of which are illustrated.

"Syracuse and Its Surroundings" is the title of an artistic pamphlet representing that city, its public buildings, principal industries, &c., together with a number of very tasty sketches of scenery in the vicinity. Among the business houses thus represented are the works of E. C. Stearns & Co., the illustration of which indicates their extent and completeness.

The catalogue of Indurated Fibre Ware issued by Cordley & Hayes, 173 and 175 Duane street, New York, gives a description of the various lines, their uses and dimensions, while interesting information is also given in regard to the process of manufacture. Retail prices only are quoted, from which a trade discount of 25 per cent. is given. It is also stated that Pails are now painted to represent the Indurated Fibre Ware, and that other imitations are being put on the market.

Schulte, Lohoff & Co., Evansville, Ind., issue a price list of their line of Edge Tools, including Shingling, Half, Lath, Claw, Solid Steel Shingling and Broad Hatchets, Carpenters' and Ship Carpenters' Adzes, Butchers' Choppers, Kitchen Cleavers' and Carpenters' Pincers, of which they have been manufacturers for two years. They allude to their goods as being in excellent demand and are contemplating the building of a new addition to meet the requirements of their trade. They are now running exclusively on Tools and Steel Castings, which are cast from crucible furnaces.

The Corbin Cabinet Lock Company have on exhibition in their Chicago salesroom, 63 Washington street, a specimen cabinet of post-office boxes, equipped with their new post-office lock. The boxes have a metallic framework in front, of ornamental design. The doors are metal, with a glass inserted in each, to permit the interior to be seen. The locks are very ingeniously constructed, each lock being of the same pattern, yet each being capable of an arrangement of the tumblers so that no two keys are alike. A master key, to be used by the postmaster alone, will unlock any of the locks from the inside in case a key should be lost and it becomes necessary to reset the lock to a different combination of the tumblers. The keys are small and flat. The cabinet of boxes shown has 26 compartments, and is suited to the requirements of a post office in a town of 300 or 400 inhabitants. The post office at Peoria, Ill., was recently fitted with boxes of this pattern. They have also been put into the post office at Council Bluffs, Iowa. The post offices of Evanston and Lake View, Ill., are now having them put in. A large number of offices in large and small towns in various other parts of the country are using them.

On the 10th inst. what is said to be the longest train of Farming Implements that ever crossed the continent arrived in Chicago from Massillon, Ohio, and left at 10.40 a.m. on a special over the Wisconsin Central Railroad, the destination being Portland, Ore. The train, which consisted of 26 cars, the first 5 of which were equipped with air-brakes, stood in the Forty-eighth street yards, and was admired by the officials of nearly every road centering in Chicago. The value of the Implements, which included 46 Threshers, 32 Farm Engines, and 24 Horse-Powers, is estimated at \$80,000. From the engine to the caboose a long white streamer was stretched, on which was painted in black letters "Russell & Co., Massillon, Ohio. To Russell Farming-Implement Company, Portland, Ore. The longest train of its kind that ever crossed the continent." The train was taken through on passenger time, and was expected to arrive at its destination in a week from its departure from Chicago.

Matthai, Ingram & Co., Baltimore, Md., have issued their catalogue of summer goods. It refers to Water Coolers, Refrigerators, Freezers, Vapor and Gasoline Stoves and a variety of Tinware. It is accompanied by a discount sheet and leaflets calling attention to such specialties as the Gem Apple Corer, Acme Stove-Pipe, Fly Fans, the Favorite Baking Pan, &c.

The American Machine Company, Philadelphia, Pa., for whom John H. Graham & Co. are agents, 113 Chambers street, New York, issue a striking showcard and other advertising matter illustrating their Gem Ice-Cream Freezer, and also a circular setting forth some of the merits possessed by it and their Ice Tools.

The George Worthington Company, Cleveland, Ohio, have issued a convenient spring circular showing an attractive line of seasonable goods, to the display of which more than 50 pages are devoted. Steel goods are naturally given a prominent place, and are followed by Shovels, Spades, Post-Hole Diggers, Floral Sets, Wheelbarrows, Grindstones, Lawn-Mowers, Refrigerators, Bird-Cages, Sheep-Shears, &c. It thus represents, of course, only a small portion of the extensive line carried by the company.

The issue of *Lock and Bell* for the present month contains 24 pages, having been again enlarged, so that it is now just double the size it was when first started, in October, 1887. This expansion is a gratifying evidence of its success, which is based upon the enterprise and skill with which it is made to occupy its field.

T. E. Parker, connected with the *Ironmonger*, of London, England, is at present in this country visiting the various trades of general interest to that journal. He leaves New York to-day (Thursday) for an extended trip, stopping at Philadelphia, Baltimore, Pittsburgh, Cincinnati and St.

Louis, and returning by way of Chicago, Cleveland, Buffalo, Toronto, Montreal, Boston and New Haven. Mr. Parker has resided for some time in South America and South Africa, and is familiar with the requirements of the Hardware trade in those portions of the globe.

E. M. Richardson, Waltham, Mass., in his circular relating to his Shedd's Blind-Fast, calls attention to its special features, and emphasizes the fact that it has a coil spring and is attached by means of a screw, and does not drive into the blind, like others made in imitation of it. The quality of the Fastener is also alluded to.

Richardson Bros., Newark, N. J., have issued a new catalogue bearing date January 1, 1889, in which they represent their well-known line of Saws. In their introductory remarks they state that since their last issue they have greatly increased their facilities by the introduction of new machinery, and refer to the gratifying testimonials which they have received from the trade in regard to the quality of the goods. They also call attention to the excellence of the shipping facilities with which the city of Newark is provided, the rates over leading fast freight lines being the same as from New York. They allude specially to their new Butcher Saws, which are shown on pages 53 to 55, and their patent improved Blade Tightener, the simplicity and efficiency of which is referred to. In addition to their line of Saws the catalogue also represents Scrapers, Plastering and Brick Trowels, Molders' Tools, Cane Knives, Screw-Drivers, &c.

Announcement is made that the firm of Wilcox, Brother & Co., Adrian, Mich., has been dissolved, H. H. Wilcox retiring. Geo. A. Wilcox, Wm. A. Stanford and Wm. S. Wilcox have purchased the entire interest of the late firm, and will conduct the business at the old stand under the firm name of Wilcox Hardware Company.

There has been a consolidation of the Hardware business of Wells-Stone Hardware Company and A. B. Chapin & Co., both of Duluth, Minn., under the name of Chapin-Wells Hardware Company.

Chas. L. Pierce & Co. are representing Hardware manufacturers in San Francisco, Cal., and are, we are advised, at the present time agents for Hubbard & Co., Pittsburgh, Pa., J. F. Wollensak, Chicago, Ill., Burke Mfg. Company, Youngstown, Ohio, James L. Haven Company, Cincinnati, Ohio, and Kline Mfg. Company, Chicago, Ill., and are negotiating with a view to other agencies. Mr. Pierce has been for some time with the John Russell Cutlery Company, having previously been long connected with the A. F. Shapleigh Hardware Company, St. Louis, and is widely known to the trade, and will have their best wishes in this new departure. In connection with their office it is intended to have a collection of catalogues and price-lists of manufacturers, which will be placed at the service of those in the trade desiring to consult them.

C. J. Bailey & Co., 132 Pearl street, Boston, Mass., issue circulars describing their manufactures in the line of Rubber novelties, including principally Brushes, among which is a Dauber which is referred to as having special advantages.

The Hotchkiss and Upson Company, Cleveland, Ohio, issue a circular illustrating their patent Nut-Lock Track Bolt with solid slot. They explain its construction and use, and allude to the advantages possessed by it.

Enterprise Mfg. Company, Philadelphia, Pa., under date 12th inst., issue a circular to the Hardware trade stating that they have procured new molders to take the place of those who struck and are now in position to fill all orders promptly. They

when wanted, while at the same time it opens the trap door. The weight by which it is operated is entirely out of sight in the rear of the shelving. There is also a cord running from the bottom of ladder through a pulley in the ceiling back of the weight. This device is original with Mr. Ziegler, and is found to be exceedingly convenient

Fig. 335.—Arrangement of Hanging Walk.

and satisfactory. The shelving around the entire store extends from the floor to the ceiling.

It will be observed that in the front of the store opposite the entrance there are some 40 feet of showcases forming three sides of a rectangular parallelogram, which is devoted to Notions, Sporting Goods, Base-Ball Goods, Fishing Tackle, Pocket and Table Cutlery, &c. In the rear of this is the Sporting Department, in which are two pillars which are surmounted by large circles 7 feet in diameter, which are used for suspending Bird Cages, Tin Buckets and Lanterns, thus making a

Fig. 336.—Steel Goods and Bell Rack.

good display when properly arranged. Underneath these circles there are smaller ones which are used for Brushes, Tackle Blocks, Steel Traps, Dog and Coil Chain, &c. There are seven of these pillars in the store and each of them is surmounted with such circles.

Toward the rear of the store there are counters with samples of Vises, Wagon Jacks, Lifting Jacks, &c. Next is a Steel Goods and Bell rack, represented in illustration, Fig. 336. Opposite this rack, on the south side, there are bins under counters, in which are kept Wire and Cut Nails, Staples and Horseshoes. Fig. 337 shows some of these bins with the Rope coming through the floor on the end of counter from reels in basement.

In the northeast corner of the store there is shelving for Japanned-Ware, also

a stationary gas pipe which runs up to the hanging walk on the north side of the store. Other details in regard to the arrangement may be gathered from the full and complete diagram, Fig. 338.

In connection with the establishment there is an annex on the opposite side of the street, which has a frontage of 23 x 90 feet, and is used as a sample-room for all kinds of Farm Machinery, Wagons, Wind-mills, &c. In the rear of this room there is another, 23 x 50 feet, used for Bar Iron, Steel, Coil Chain, &c., and back of this a warehouse, 36 x 70 feet, devoted to Farming Implements, Gas-Pipe and Fittings, Pumps, &c., and in connection with this warehouse a farm-wagon shed, 20 x 100 feet.

#### Improvements in Hibbard, Spencer, Bartlett & Co.'s Stores.

We have previously alluded to the extension of Hibbard, Spencer, Bartlett & Co.'s establishment at Chicago by the addition of the two store buildings adjoining them on the east. These buildings have now been connected with the main business block by the opening of

Fig. 337.—Counter with Bins, Rope, &c.

suitable passageways through the partitions on the several floors, and are being rapidly converted to the use of special departments. Each building has a depth of 140 feet, a width of 25 feet and a height of five stories, thus adding immensely to the capacity of this huge Hardware emporium. The room on the ground floor of the first new building to the east, which is No. 20 Lake street, will be used as a sample-room for House-Furnishing Goods. It extends the full depth of the block, and is being handsomely finished on both walls and ceiling. It is the express intention of the firm to make this the finest sample-room for House-Furnishing Goods in the country. The floors above will be devoted to stock. The room on the ground floor in the other new building, No. 18 Lake street, will be used as a sample-room for Lamps and Glassware, not including Crockery. It also extends the full depth of the block, and affords ample room for a magnificent display of goods, now very largely in place and ready for inspection by buyers. The floors above this room are intended for packing and for storing stock.

The Lamp and Glassware department of this house will carry the largest stock in Chicago of either kind of goods. The samples show a bewildering variety of Lamps, Shades, and all the fixtures and appliances pertaining to the Lamp business. All kinds of Lamps are shown, ranging from the plainest and cheapest to the most elaborately decorated and dearest. The stock is one from which a perfect selection can be made to suit any locality and all eccentricities of taste. The Hanging Lamps run from \$1.25 each up to, say, \$30, or as high as any buyer would wish to go. They are resplendent in jewels, prisms, tinted glass shades, decorated shades of delicate or brilliant colors, and most artistic brasswork, some remarkably

fine specimens of *repoussé* work being embraced in the collection. In contradistinction to the policy of other Lamp and Glassware establishments of Chicago, but in harmony with the customs of this house in other departments, no goods are sold at retail, but an exclusively jobbing business is conducted, so that a retail merchant knows here, at least, his customers cannot purchase the special goods they want and at as low prices as himself. Special salesmen are employed for this department, and it is managed by men who thoroughly understand the requirements of this branch of trade. The remarkable success achieved by Hibbard, Spencer, Bartlett & Co. in selling Lamps, may be regarded as an indication of the possibilities of this more extended department under the management of trained specialists.

The addition of these two buildings gives the firm more space for their packing department, which had been badly needed. They now have five packing-rooms, each extending the full depth of the block, 140 feet, four of them being 25 feet wide each and one 50 feet wide. In these rooms from 40 to 50 packers are at work all the time, which conveys some idea of the immensity of the business transacted. Several elevators are now in use in the different buildings, each elevator having its special assignment of freight. For instance, some take goods up exclusively, others take goods down only, and others are for the carriage of clerks and passengers generally.

In going through this large business block the visitor is impressed by the methods which have been devised to economize space, as he would naturally suppose that ample room would be found for everything. Shelving is put up in every available quarter in which to show stocks of goods, and bins innumerable extend on every hand. The stock-room for Pieced Tinware, for instance, is quite a curious sight. It is about 14 feet high and 25 feet wide and extends almost the entire depth of the block. On one side of this room a row of bins extends along the partition from the floor to the ceiling 4 feet deep, and on the other side the bins are 10 feet deep, leaving a passageway 11 feet wide between, which about affords room enough for the porters to pass with their trucks bringing in and taking out goods. A force of carpenters is constantly employed in putting up shelving, making and arranging bins, and otherwise reconstructing and repairing.

Incandescent electric lights are used throughout this establishment, so that no matches need to be lighted in any part of it, thus reducing to a minimum the danger of fire, which always accompanies the use of gas.

The rapid filling up of the new additions with samples and packages shows how much the space thus gained was needed. Whether the firm have thus attained their full growth remains to be seen. But as they are constantly increasing and extending their lines and pushing their trade, with the evident determination to keep in the fore-front in the Northwest, the further expansion of their facilities would seem to be predestined.

#### Exports.

PER BARK E. SUTTON, APRIL 1, 1889, FOR PORT ELIZABETH, SOUTH AFRICA.

By R. W. Forbes & Son.—1 Spring Wagon, 1 set

Harness, 1 box Electric Batteries.

By Des Bruij & Allen.—200 Plows and Parts, 10

Shellers.

By Carr & Hobson.—7896 pounds Plows and Plow

Woods.

By Corner Bros. & Co.—200 Plows, 4½ dozen

Clocks, 5¼ dozen Brooms.

By Carey, Gale & Lambert.—128 pounds Sash

Cord, 6220 pounds Sash Weights.

By A. Field & Co.—7 dozen Rakes, 1500 pounds

Nails, 15,000 Cartridges, 24 Blocks, 20 dozen

Handles, 6 dozen Braces, 3 dozen Meat Cut-

ters, 36 Scales, 24 Traps, 2 dozen Locks, 15

dozen Axes.

By Arkell & Douglas.—13 cases Handles, 1 bundle

Sash Cord, 816 pounds Sash Weights, 1 case

Hardware, 6 Ladders, 1 case Planes, 8 cases Clocks, 1 case Augers, 36 dozen Handles, 14 gross Polish, 1 case Pumps, 4 bundles Pipe, 12 dozen Trucks, 17,000 Spokes, 1 dozen Rims, 24 dozen Brooms, 2 Washers, 6 dozen Axes, 1 case Hardware.

By *W. H. Crossman & Bro.*—2 dozen Wagons, 2 cases Slates, 1 case Wagon Jacks, 2 dozen Washboards, 15 dozen Brooms, 8 Churns, 5 boxes Clothes Pins, 2 dozen Traps, 1 dozen Saws, 11 cases Plow Parts, 14 dozen Hay Forks, 14 dozen Carriages, 5 cases Sash Weights, 2000 pounds Nails, 2563 pounds Barb Wire, 1 dozen Clocks, 6 cases Hardware, 8 dozen pails, Axle Grease, 10 Hand Carts, 75 Plow-Wheels.

By *Coombs, Crosby & Eddy.*—24 Plows and Parts, 12 cases Sash Weights, 1 case Sash Cords, 25 dozen Brooms, 9 Pumps, 12 dozen Edge Tools, 22 dozen Axe and Pick Handles, 3 Hay Cutters, 1 dozen Hose Couplings, 112 Plows and Parts, 36 dozen Axe Handles, 5000 pounds Nails, 50 dozen Edge Tools, 4 barrels Fuse, 40 dozen Edge Tools, 1000 Broom Handles, 2 dozen Handles, 52 cases Ladders, 96 Plows and Parts, 60 dozen Axe and Pick Handles, 762 pounds Slate, 70 dozen Edge Tools, 2600 pounds Nails, 25 boxes Clothes Pins, 2 Wooden Scoops, 20 dozen Edge Tools, 15 Scales, 10 dozen Picks, 96 Plows and Parts, 240 dozen Brooms, 29 pounds Sash Cord, 6 dozen Sash Fasteners, 6 dozen Clocks, 13 dozen Padlocks, 4 dozen Agricultural Hardware, 8 gross Hardware, 1150 pounds Sash Weights, 36 Sewing Machines.

PER BARK REDFORD, APRIL 8, 1889, FOR BUENOS AYRES, ARGENTINE CONFEDERATION.

By *J. B. Woodward.*—3000 pounds Wicks, 40 gross Shoe Polish, 100 gross Blacking, 2000 pounds Shoe Nails, 2500 pounds Shoe Tacks, 307 Corn Shellers, 301 Plows and Repairs, 10 dozen Axes, 10 dozen Hay Knives, 48 dozen Hat Racks, 38 dozen Bit Braces, 178 dozen Clocks, 2 dozen Washing Machines, 25 Hay Rakes and Repairs, 24 packages Tinner's Tools, 50 dozen Hatchets, 2 dozen Nail Pullers, 440 Sewing Machines and Repairs.

By *Samuel Lees & Co.*—6 cases Pumps, 6 crates Steel Door Mats, 4 cases Grindstones, 2 cases Carpet Sweepers, 2 cases Hardware, 2 cases Fly Fans, 1 case Hatchets.

By *J. Norton & Son.*—25,000 Carbons, 1860 pounds Wagons, 80 crates Blacking.

By *J. H. Snyder.*—230 packages Windmill and Tower, 7 Wagons, 25 dozen Hoes and Scrapers, 230 Plows and Cultivators, 60 dozen Axes, 20 Corn Shellers, 12 Churns, 61 Meat Cutters and Stuffers.

By *Pearce & Jones.*—41,000 feet Wire, 4000 Gun Insulators, 70 coils Wire.

By *Stevens, Corwin & Co.*—1 case Hardware, 12 cases Hardware, 300 pounds Twine, 12 Clocks, 30 cases Iron Nails, 6 Ranges, 2 Wagons, 3 Iron Saws.

By *Healy & Earl.*—20 Horse Rakes, 6 Harrows, 48 Corn Mills and Repairs.

By *Abendroth Bros.*—115 Stoves and Parts.

By *W. Lunham.*—1 Windmill.

By *F. H. Lovell & Co.*—5444 pounds Lamp Goods.

PER BARK ANNIE J. MARSHALL, MARCH 27, 1889, FOR BUENOS AYRES, ARGENTINE CONFEDERATION.

By *John Dunn, Son & Co.*—6 Shellers, 120 Mills, 216 dozen Plow Parts, 388 dozen Plows, 1500 dozen Lamp-Ware, 56 Mowers, 222 dozen Tools, 200 Clocks, 45 dozen Blocks, 400 dozen Brushes, 100 dozen Wrenches, 1000 gross Wicks, 4500 pounds Wicks, 240 gross Clothes Pins, 74 dozen Cutters, 8 dozen Trucks, 12,000 pounds Horse Nails, 100 Scales, 1500 dozen Handles, 110 dozen Hardware, 37,000 pounds Tacks, 15,000 pounds Shoe Nails, 200 dozen Scales, 10 dozen Beaters, 40 gross Sewing Machine Oil, 5 dozen Stuffers, 20 gross Traps, 200 gross Blacking, 40 dozen Knives, 5 dozen Irons, 800 dozen Forks, 1000 dozen Slates, 48 Shellers, 50 dozen Saws, 40 dozen Cages, 275 dozen Brushes, 11,000 pounds Shoe Nails, 50 dozen Hammers, 25 Scales, 12 Washing Machines, 15 packages Scales, 400 dozen Hatchets, 100 dozen Handles, 24 dozen Rakes, 30 dozen Hammers, 125 dozen Wheelbarrows, 30 Scales, 3 dozen Wheelbarrows, 50 dozen Scoops, 60 dozen Hat Racks, 8 Corn Mills, 18 Clocks, 277 dozen Tools, 404 dozen Corn Shellers, 106 dozen Washboards, 12 Stoves, 4 dozen Lamp-Ware, 60 Plows, 300 dozen Locks, 447 dozen Edge Tools, 4 dozen Lamp-Ware.

PER BARK H. BREMER, APRIL 6, 1889, FOR PORT NATAL, SOUTH AFRICA.

By *R. W. Cameron & Co.*—75 Plows.

By *New Home Sewing Machine Company.*—51 cases Sewing Machines.

By *Corner Bros. & Co.*—94 packages Hardware, 4 packages Agricultural Implements, 35 packages Hardware.

By *W. H. Crossman & Bro.*—12 cases Plow Parts, 5 cases Plow Parts, 18 cases Hardware, 6 gross Polish, 12 dozen Carpenters' Tools.

By *R. W. Forbes & Son.*—1 case Lamp-Ware, 24 dozen Ladders, 40 dozen Axe Handles, 23 dozen Axes, 20 boxes Scales, 6 dozen Saws, 74 dozen Axes, 12 boxes Wringers, 1 case Toys, 14 boxes Clocks, 3 Mangles, 12 packages Stoves, 162 packages Plows and Parts, 6 packages Corn Shellers, 60 dozen Brooms, 8 packages Churns.

By *Marcial & Co.*—30 dozen Brooms, 500 Handles, 5 dozen Washboards, 5 dozen Washboards, 2 dozen Varnished Pails, 3 dozen Brackets, 18 Corn Shellers, 15 pairs Axes, 4 Corn Shellers, 63 dozen Bolts, 10 dozen Axes, 2 dozen Axes, 7 dozen Wrenches, 6 dozen Hatchets, 30 Pumps, 25 dozen Spade Handles, 31 dozen Axes and Hatchets, 650 pounds Wire Nails, 30 Planes and Levels, 18 dozen Spades, 12 dozen Spades, 39 dozen Locks and Knobs, 13 cases Wheel Parts, 1 dozen Choppers, 14 dozen Tobacco Cutters, 5 cases Irons, 2 Quaker Mills, 2 dozen Mill

Pick Blades, 14 dozen Handles for same, 14 dozen Cages, 10 dozen Hammers, 84 dozen Trowels, 4 dozen Knives, 6 dozen Saws, 10 dozen Saws, 18 dozen Saws, 10 dozen Axes, 6 Boston Trucks, 1000 pounds Horseshoes, 5 dozen Brackets, 12 dozen Can Openers, 44 dozen Bench Vises, 1 gross Carriage Knobs, 3 gross File Handles, 74 dozen Brackets, 6 dozen Chisel Handles, 2 cases Hardware, 1 dozen Hand Screws, 2 dozen Wood Bench Screws, 112 pounds Oil Stone, 1 dozen Charcoal Iron, 32 dozen Lines, 1 case Handles, 1 case Gauges, 14 dozen Axl Hafta, 6 dozen Locks, 2 dozen Axes, 36,500 pounds Nails, 8 Shellers, 4 Shellers.

PER SHIP TROOP, APRIL 8, 1889, FOR MELBOURNE, AUSTRALIA.

By *F. B. Wheeler & Co.*—23 sets Harness, 6 dozen Velocipedes.

By *Winchester Repeating Arms Company.*—18 Guns, 50,000 Primers, 12,000 Loaded Shells.

By *Meriden Britannia Company.*—5 packages Plated-Ware, 6 boxes Plated-Ware, 3 boxes Plated-Ware.

By *Simpson, Hall, Miller & Co.*—500 pounds Plated-Ware, 500 pounds Plated-Ware, 750 pounds Plated-Ware.

By *Nevius & Haviland.*—4079 Shade Rollers.

By *A. Field & Co.*—1 case Links, 109 pounds Tacks, 650 dozen Hardware, 146 pounds Paint, 566 pounds Malleable Iron, 26,700 Bolts, 370 dozen Hardware.

By *R. Irwin & Co.*—120 dozen Fruit Jars.

By *Healy & Earl.*—1 case Planing Machine, 8 cases Governor Valves.

By *Welsh & Lea.*—10 cases Axes, 3 cases Handles, 2 packages Meat Choppers.

By *Wheeler & Wilson Mfg. Company.*—302 Sewing Machines.

By *Ansonia Clock Co.*—61 boxes Clocks, 30 boxes Clocks, 56 boxes Clocks, 34 boxes Clocks, 20 Boxes Clocks.

By *Sargent & Co.*—61 cases Hardware, 17 packages Castings, 4 boxes Castings and Bells.

By *White Sewing Machine Company.*—5194 pounds Sewing Machines.

By *Edward Miller & Co.*—40 packages Lamp Goods.

By *Coombs, Crosby & Eddy.*—7 dozen Hammers, 8 dozen Rakes, 24 dozen Wood Handles, 6 dozen Hatchets.

By *U. James.*—2500 pounds Lawn Mowers.

By *W. K. Freeman.*—37 packages Hardware.

By *Singer Mfg. Company.*—977 cases Sewing Machines.

By *H. W. Peabody & Co.*—430 pounds Hammers, 7 cases Agricultural Implements.

By *Arnold, Cheney & Co.*—1 case Malleable Iron, 13 cases Hubs, 5 cases Spokes, 1 case Saddlery, 37 bundles Spokes, 3 cases Whips, 5 cases Iron Velocipedes, 63 cases Handles, 1 case Bolts, 52 cases Handles, 3 cases Bolts, 1 case Bolts, 24 packages Stoves, 21 cases Saws, 81,361 pieces Roofing Slate, 300 boxes Clothes Pins, 9 cases Axes.

By *McLean Bros. & Rigg.*—16 dozen Lamps, 12 dozen Chimneys, 25 dozen Plumbs and Levels, 4 dozen Cork Pullers, 250 feet Rubber Hose, 35 dozen Brackets, 66 dozen Axes, 177 dozen Drills, 2000 pounds Nails, 39 Refrigerators, 14 packages Lampware, 48 Mouse Traps, 12 dozen Gate Latches, 10 packages Grindstones and Parts.

By *W. H. Crossman & Bro.*—21 dozen Cow Bells, 4 cases Hardware, 3 cases Stone, 2 cases Hardware, 3 dozen Tin Kettles, 1 gross Graters, 2 cases Hardware, 84 dozen Braces, 168 pounds Stone, 9 packages Hardware, 8 cases Hardware, 18 dozen Hammers, 21 gross Whips, 1 bundle Handles, 93 dozen Axes, 24 dozen Hay Forks, 1 gross Graters, 312 dozen Handles, 22 packages Hardware, 33 dozen Axes, 7 dozen Churns, 1 gross Graters, 15 gross Sewing Machine Oil, 1 gross Vegetable Presses, 25 dozen Chimneys, 1 gross Graters, 12,000 Metallic Cartridges, 50 dozen Braces, 32 dozen Axes, 24 dozen Hinges, 5 cases Hardware, 12 dozen Braces, 8 dozen Valves.

By *Arkell & Douglas.*—2 cases Handles, 4 cases Plated-Ware, 2 crates Wheels, 1 bale Rubber, 117½ pounds Wagon Springs, 24 dozen Handles, 9½ pairs Shafts, 8 cases Carriage-Ware, 4 dozen Bars, 1 case Thermometers, 5 cases Hardware, 1 case Hubs, 3 cases Spokes, 2 dozen Wagon Jacks, 1 case Bolts, 6 cases Spokes, 1 case Hubs, 10 cases Nails, 1 case Sandpaper, 12 dozen Handles, 3 dozen Axes, 9 Refrigerators, 13 cases Traps, 521 pounds Nails, 8 cases Hardware, 2 cases Forks, 3 cases Hose, 3 packages Hammocks, 3 cases Blacking, 5 cases Grindstones, 2 gross Machine Oil, 35 cases Hardware, 27 cases Handles, 3 cases Hose, 27 cases Axes, 32 packages Hardware, 5 cases Bolts.

By *R. W. Cameron & Co.*—300 cases Wheels, 2050 pounds Pumps, 545 pounds Castings, 1700 pounds Sewing Machines, 2887 pounds Castings, 1240 pounds Castings, 1250 pounds Saw Machinery, 430 pounds Carts, 10 cases Sewing Machines and Parts, 21 cases Hardware, 37 bundles Spokes, 3 cases Carriage-Ware, 7 cases Carriage-Ware, 4 boxes Lampware, 1 case Carpet Sweepers.

By *R. W. Forbes & Son.*—3 cases Wringers, 18 dozen Fly Traps, 50 dozen Washers, 2 boxes

Plated-Ware, 1 case Clocks, 80 sets Axes, 34 packages Hardware, 1 gross Harness Oil, 1 case Sandpaper, 2609 pounds Bolts, 6 gross Fish Lines, 17 packages Fire Arms, 4 gross Sewing Machine Oil, 81 dozen Axes, 30 packages Stoves, 18 packages Hardware, 35 gross Lamp Wicks, 500 Broom Handles, 6 dozen Hoe Handles, 3 packages Plows and Parts, 5 cases Wringers, 9 cases Sad Irons, 46 packages Hardware, 3 packages Toys, 26,920 pounds Barb Wire, 22 cases Wringers, 20 dozen Fork Handles, 5030 pounds Carriage Bolts, 20 dozen Hoes, 6 dozen Rakes, 30 dozen Snaths, 1 case Stencils, 4 cases Wire Goods, 4 packages Agricultural Implements, 4 packages Fire Arms, 5 gross Axle Grease, 5 cases Kitchen Utensils, 4 packages Pails, 18 dozen Hatchets, 2 gross Casters.

By *Strong & Troubridge.*—1 case Cartridges, and Fire Arms, 14 cases Cartridges, 4 cases Tools, 1 case Nails, 1 case Wire Goods, 1 case Locks, 1 case Pumps, 1 case Mangles, 2 cases Handles, 3 cases Locks, 4 cases Tools, 2 cases Broom Handles, 3 packages Lampware, 3 cases Castings, 2 cases Traps, 30 kegs Nails, 1 case Toys, 3 cases Wringers, 1 case Hardware, 1 case Rivets, 5 cases Hatchets, 50 boxes Clothes Pins, 6 nests Pails, 1 case Hardware, 1 case Sluice Forks, 1 case Lampware, 1 case Locks, &c., 1 case Plated-Ware, 4 cases Choppers, 5 cases Nails.

### Spanish Iron Minerals.

It appears that the aggregate exports of iron ore from Bilbao last year amounted to 3,591,637 tons, as compared with 4,170,422 tons in 1887, and 3,160,047 tons in 1886. Of these exports, 2,481,435 tons were forwarded to the United Kingdom last year, as compared with 2,855,667 tons in 1887, and 2,151,137 tons in 1886. The United Kingdom alone absorbed 69 per cent. of last year's exports. Holland took 644,235 tons last year, as compared with 707,394 tons in 1887, and 534,687 tons in 1886. France ranked third with an importation of 347,687 tons last year, as compared with 356,980 tons in 1887, and 332,108 tons in 1886. The only other considerable importer was Belgium, which took 103,602 tons last year, as compared with 98,304 tons in 1887, and 98,442 tons in 1886. It will be seen that while Great Britain took 69 per cent. of the iron minerals exported from Bilbao last year, Belgium hardly took 3 per cent. Of the Spanish iron minerals exported from Bilbao last year to Great Britain, 558,091 tons went to Middlesborough, 476,641 tons to Cardiff, 861,262 tons to Newport, and 236,724 tons to Newcastle-on-Tyne. As regards France, 182,844 tons went to Dunkerque and 92,918 tons to Bayonne. The deliveries of iron minerals coastwise from Bilbao last year were 39,956 tons, as compared with 28,274 tons in 1887, and 25,181 tons in 1886. As regards the local consumption of Spanish iron minerals at Bilbao, it appears that the Vizcaya forges used last year 166,508 tons, the San Francisco del Desierto Works 113,392 tons, and the Bilbao Blast Furnaces Company 134,000 tons, making an aggregate of 413,900 tons. We learn that the ironstone mines of the Bilbao district will have to contend in future against the competition of iron minerals, which have been found to exist in other localities in Spain. The new mines are stated to be richer than those of the Bilbao district, and their minerals further contain an advantageous proportion of manganese.

It is reported that one of the blast furnace companies in the Lehigh Valley has purchased lately 7500 tons of non-Bessemer ore, guaranteed 58 per cent., at \$2.65, f.o.b. Escanaba, and an equal quantity of ore, guaranteed 60 per cent., at \$2.75, f.o.b. same port. The freight from Escanaba to Buffalo is \$1.05, and from Buffalo to the point in the Lehigh Valley, \$1.55, making the cost at furnace, of the 58 per cent. ore, \$5.25, and of the 60 per cent. ore, \$5.30. Foreign 55 per cent. ore has been offered at \$4.85, delivered at furnace.

**Daisy Lemon and Lime Squeezer.**

This article is put on the market by James D. Frary, Meriden, Conn., and is represented in the accompanying illustration, which indicates the manner of its use. In No. 40 the cup and the cone of the squeezer are coated with an elastic rubber material, and in No. 60 they are tinned. The rubber coating is referred to as very satisfactory for this use, as it is proof against lemon-juice. In using this squeezer it is placed on the top of tumbler or cup, as shown in the illustration, when,

*Daisy Lemon and Lime Squeezer.*

the handle being raised, a half lemon is placed with the left hand on the top of the cone, when the handle is pressed downward with the right hand. The squeezer being then held by the left hand, the juice is extracted readily by means of the pressure and one or two turns of the handle. The thoroughness with which it does its work and the fact that the juice of the lemon is obtained free from seeds and pulp and without soiling the fingers or clothing are points made in regard to this article.

**Knife-Balancing Machine.**

We present in the accompanying engraving a general view of a patent proportional knife-balancing machine manufactured by the Defiance Machine Works, of Defiance, Ohio. This machine is brought out to meet a well-defined want for a machine for perfectly balancing molding knives, planer knives, revolving cutters, knife cap screws, &c. In operating this machine each knife is placed in succession on the platform of the balancing machine with its face toward the end-board, shown at the left of the engraving. At the opposite

end of the beam is placed a suitable weight. If it is found that the knives are of the same specific weight, they are then placed in succession with their backs against the end-board just referred to. If they still appear to be of the same specific weight, they are then placed in succession flatwise on the platform in as many different positions as may be possible. By repeated trials it will thus be ascertained when they are all reduced to the same

and dies are employed in the manufacture, so all the parts are of uniform size and the work and cost of making them very much reduced.

**New Twine Box.**

We illustrate to-day a new twine box of ingenious pattern that is being put upon the market by the Wire Goods Company, of

*Knife-Balancing Machine.*

weight in their corresponding parts. The balance weights shown at the right in the engraving are made oblong, so that by placing the heavy end up the entire mass, consisting of weight, beam and knife, may be poised near its center of gravity and thus oscillate more sensitively. If, however, the object to be balanced be very heavy the weight must hang down. From an inspection of the engraving it will be seen that the operator can make the poise more or less delicate according to the varied positions of the knives to be balanced.

**The Perfection Funnel.**

A new form of funnel which possesses a number of advantageous features is manufactured by Augustus Gersdorff, proprietor of the Perfection Funnel Works, Bridgeton, N. J. The nozzle of the funnel, is, as will be noticed triangular in section with rounded corners, so that when it rests in the neck of a bottle there is ample space for the escape of the air. By this means the pouring can be done more rapidly, and the liquid is prevented from spilling out of the funnel by an inturned rim or edge. In the construction of the funnel each section is made of one piece of tin without the middle seam, which ordinarily makes a lodgment for dust and dirt and interferes with cleaning. Another feature of these funnels is the use of removable strainers,

*The Perfection Funnel.*

through which the liquid is passed as it enters the bottle. The strainers, having three notches in the edge, are held in position by small lugs formed in the seams of the funnel, and may readily be unseated and removed. The funnels are made of tin or copper tin-lined, and the shape of the pieces from which they are constructed permits the sheet metal to be cut with very little waste. Special presses

Worcester, Mass. The weight is suspended between two slides and the twine is threaded over it in such a way that as twine is drawn from the box the weight is lifted to the top of the slides. When sufficient string has been used and broken off, so that the twine is released, the

*New Twine Box.*

weight promptly drops to the bottom of the slides, and in doing so takes up the slack of the twine and draws it back to the position from which it started. By this very simple device the annoyance of snarled and unraveled twine is done away with, and the end of the string always hangs at the same point ready for the next one who shall come to use it. The Wire Goods Company announce that they will supply the twine boxes with attachments complete, as per the illustration, or they can supply the attachment separately, to be hung up over any twine box already in use, and to perform the same service that it does in the twine box complete.

**Post or Pile Driver.**

This machine is intended for light work, such as the driving of posts for wire fencing and the like. It is simple in construction and easily operated, and can be readily moved from place to place. When not in use, the hammer guides fold down and rest parallel with the body of the machine, thereby facilitating transportation. The guides are made of two pieces of pipe united at their upper ends by a yoke, and fastened at their lower ends into shoes hinged to the base. The winding drum is placed vertically at the opposite end of the machine, and the upper end of its shaft is provided with a sweep arm, and at its lower end is furnished with a clutching ring which may be disengaged from the drum to permit its free turning and the falling of the hammer. The clutch is automatically relieved by a lug projecting in the path of the hammer, which is suitably connected with the clutch. This lug can be placed at any desired height to regulate the stroke of the hammer. This machine is the invention of Oldham & Roberts,

*Automatic Fence-Post Driving Machine.*

3849 Finney avenue, St. Louis, Mo., by whom also it is put on the market.

**Logan's Patent Stall Drain.**

The accompanying illustration represents a stall flooring patented and manufactured by Martin Logan, 164 East Seventy-seventh street, New York. The lower part of the cut given represents the drain as placed in the stall, and the upper part shows the bed plate and slats, which are sold for the use indicated. The bed plate is 19 inches wide, 5 feet long, with gutters 1 inch wide, and is made of cast iron, the wood slats, inserted as indicated, being made of hard oak. The channels between each wooden slat act as independent gutters to carry the refuse off to the main gutter. It will be observed that it is constructed without the use of nails or screws to injure horses, and when the wood slats are worn they can readily be removed and replaced without the aid of a carpenter by lifting up the bed plate and sliding slats in place from the forward end of the plate. The manufacturer also points out the advantage it possesses in having the bed plate of iron, as promoting cleanliness in the stable and preventing soaking and disagreeable smells, and it is claimed that it will afford health and comfort to the horse, and prevent the rise of ammonia from injuring carriages. The slats are 2 inches wide and 2 inches deep, and the whole depth of plate and slat is 2½ inches.

Some time ago we alluded to the alleged records in wire-rod rolling on which English manufacturers seemed to pride themselves. German makers, too, appear to regard their latest mills in the light of advanced practice. As a matter of fact,

American wire-rod mills are greatly ahead of anything that is being done in Europe. At Warrington, England, as we noted some time since, 870 to 400 tons rolled in one week was regarded as good work. In

work, the enormous advance made will be appreciated. If our English and German friends have anything approaching the records alluded to to show American wire-rod makers will be happy to learn of it.

**Knuckle-Joint Block Plane.**

We present in the illustration herewith a general view of a knuckle-joint block plane recently added to the assortment of tools manufactured by the Stanley Rule and Level Company, of New Britain, Conn. By reference to the engraving it will be seen that the method of clamping the cutter in position is by means of a knuckle-joint in the cap above it, which also serves as a convenient hand-rest after the cutter is secured in place. By the use

*Knuckle-Joint Block Plane.*

of the brass thumb nut at the rear of the plane, the cutter can be set forward or drawn back, as may be desired. The curved lever under the cutter is designed for use in adjusting the cutter sidewise, so that the cutting edge may always be exactly straight with the face of the plane. The device is well made in all respects, and is claimed to be a very convenient tool.

A rigid specification to which steel rail manufacturers point as illustrative of the excessive requirements of some of the railroad companies, was given out lately in connection with bids asked on 1500 tons of 90-pound Reading section steel rails for the Manhattan Elevated Railroad of New York. The specification in question calls for a minimum of 0.45 and a maximum of 0.55 carbon, an analysis to be taken of

*Logan's Patent Stall Drain.*

have every reason to believe that at no distant date the works now under construction will come up to a rate of output of 100 gross tons per day of 12 hours, and that 1000 tons will soon become an average week's work, running double turn. When it is considered that in 1872 15,000 pounds was regarded as a very good day's

each heat; it calls for a testing of crop ends from each heat by a drop of 2000 pounds falling 18 feet, the permanent set of this being a part of the record. The maximum weight variation is one pound per yard; the rails are to be notched and drilled for the Fisher joint, and no variation above ¼ inch standard length.

# CURRENT HARDWARE PRICES.

APRIL 17, 1889.

*Notes.*—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, APRIL 25, 1889.

## A New Aluminium Process.

London *Industries* says that "in the course of a discussion upon a paper read by Mr. W. Anderson, before the Society of Arts last week, on the Deville-Castner aluminium process, Mr. Alexander Siemens described a new process invented by Mr. Grabau, who heated fluoride of aluminium in presence of sodium. The melted sodium was poured into the vessel, which was lined with cryolite, and cooled by

the sulphate of sodium and left the aluminium fluoride ready to be reduced. The advantages of this process were that all the materials were treated at a comparatively low temperature, about 900° Celsius. The vessel in which the aluminium fluoride was heated, as well as the vessel in which the reaction took place, was lined with cryolite, so that there was no danger of impurities being incorporated into the aluminium. The low temperature was very much easier managed than the

## Balanced Compound Engine.

The Jonson patent balanced compound engine, of which we herewith present illustrations, is manufactured by the Jonson Foundry and Machine Company, of New York. This engine is of the trunk type and consists virtually of four half cylinders with cranks set opposite or 180°, forming in fact an equivalent for the ordinary high and low-pressure cylinder; the area of the annular space between the trunk and

BALANCED COMPOUND ENGINE, BUILT BY THE JONSON FOUNDRY AND MACHINE COMPANY.

water; and the heated fluoride of aluminium, in the form of powder, was thrown upon the melted sodium. Very violent reaction took place, the heat generated by the reaction being sufficiently great to melt the aluminium as well as the by-product. As soon as the reaction was complete, the whole molten mass could be poured out into suitable forms and the aluminium settled at the bottom and the cryolite at the top. To obtain the fluoride of aluminium Mr. Grabau used the cryolite, which he procured by the final reaction by putting the powdered cryolite into a solution of sulphate of aluminium. The reaction which took place between the sulphate of aluminium and the cryolite gave the aluminium fluoride. The solution was afterward evaporated, and the residue was washed with water, which took out

high temperatures of the Castner process. The Grabau process of course required the action of sodium, and the inventor was engaged in experimenting upon a new process to prepare this. A factory was at work near Hanover producing aluminium on a commercial scale."

The Queen and Crescent Route has issued a circular announcing a change of rates to a number of points, which took effect on the 1st inst. Among them we note Alton, Ill., \$3.70 from Birmingham, and \$3.45 from Chattanooga; Beloit and Janesville, Wis., \$5.25 and \$5; Massillon, Ohio, \$4.35 and \$3.85; Ottumwa, Iowa, \$5.25 and \$5; Rockford, Ill., \$5 and \$4.75; Vandalia, Ill., \$4.25 and \$4, and Wabash, Ind., \$4.15 and \$3.65.

low pressure or compound cylinder being equal to that of the high-pressure cylinder. Thus in the engine in the accompanying cut the compound cylinder being 12½ inches in diameter, the trunk 9½ inches scant; the difference in areas, 122.72—72.72=50, or nearly 8 inches, making this engine 8 x 12½ x 10 inches stroke. Steam is exhausted from the high-pressure end of each cylinder to the upper or compound end of the same cylinder, so that alternately the high-pressure end of one cylinder and its opposite compound one form a complete half stroke.

Except for electric lighting purposes, or for very large sizes where the slide-valves are of great area, the manufacturers make the high-pressure steam and compound valves in the same casting, passing the high-pressure exhaust through

ports in the valve to the low-pressure end, and by giving the steam, compound and exhaust valves a definite lead, as determined by practice, the working of both cylinders in unison is always assured. But the two valves being in the same casting and driven by a single eccentric, or in the case of the marine engine by two eccentrics, and the ordinary link motion, any change in this motion, as in using an automatic cut-off, affects the compound and exhaust as well as the live steam, and it is therefore preferable to use for this purpose an independent steam valve as shown in the cut. On marine engines the ordinary adjustable cut-off is used. Where, as above stated, the valve area is very large the valve is divided. In the case of an engine of 275 horse-power, which the above company are now building for the Government for an iron steam tender, the ordinary piston-valve is used for the live steam and a slide-valve for the compound. The advantages of this type of engine are compactness, freedom from vibration, very low center of gravity, and as all the moving parts are exact reproductions of each other, it is perfectly balanced and can be run at a very high rate of speed, making it especially valuable for electric lighting. The engraving does not show the automatic flywheel governor, as it is not an essential feature of the engine and as it is well understood. When testing this engine it was belted to a dynamo requiring 35 horse-power to run it. No variation could be detected in the speed of the engine when the entire load was instantly thrown on or off by the movement of a switch.

#### The Lead Cables in the Berlin Central Stations.

As was to be expected, the announcement which Professor Forbes made at a recent meeting of the Institution of Electrical Engineers in London, regarding the failure of the Berlin cables, has created a strong feeling of indignation among German electricians, and the feeling found vent at the last meeting of the Electro-Technical Society, held in Berlin. On this occasion Dr. Werner Siemens read a paper on "Underground Electric Light Mains," and gave a categorical denial to the statement that lead cables are destroyed by electrolytic action within three years from the time they are first put underground. In the Berlin system of underground mains four failures have occurred, but these have been all due to mechanical injury; and owing to the want of proper supervision, and especially owing to the impossibility of performing frequent tests where the mains of different districts are all coupled together as in Berlin, the faults were not detected in time to prevent failure. Out of the total of 130 km. of lead cables in Berlin, only 200 m. had to be replaced, and now the network of lead cables is again in perfect condition. In other places cables of this kind have been in use for nearly five years, and their insulation now is as perfect as when they were first put down. Dealing with the probable future extension of electric supply, Dr. Werner Siemens gave it as his opinion that in a short time the available space under the streets of large towns will not suffice for the accommodation of the various cables, gas and water pipes and sewers, nor will the surface of the streets suffice for the increased traffic, and he looks forward to the rearrangement of large towns, where there will be streets on two levels. The new streets, either over or under the existing ones, are to be exclusively used for express service with electric tramways, and for the placing of the various conductors for telephony, telegraphy, light and power, gas, water, compressed air and steam. At the same meet-

ing Herr O. von Miller read a paper on the recent extension of the Berlin electric works, which have now a capacity of 4000 horse-power, sufficing for the supply of 50,000 lamps wired. During the present year six new dynamos, representing 4600 horse-power, will be installed, and this will increase the capacity to 100,000 lamps by the end of the year. The buildings are, however, large enough to admit machinery for a capacity of 200,000 lamps.

#### Rusting of Rails in Tunnels.

M. Savioz, chemist of the St. Nazaire works, France, recently completed an interesting series of experiments on the rust-

that the influence of carbon and manganese on the rusting tendency is slight, a variation of carbon of from 0.18 to 1.10 per cent., and of manganese from 0.26 to 1.15 per cent., the proportions of sulphur, phosphorus and silicon remaining the same, showing no appreciable difference in behavior of the samples. With increasing percentage of phosphorus, on the other hand, a decided tendency to oxidation was observed. The small number of tests, however, did not admit of the formulation of any law. The tests showed, further, that samples from the upper ends of the ingots were more readily attacked than those from the lower ends, and that wrought iron, with which also comparisons

VERTICAL SECTION OF JONSON'S BALANCED COMPOUND ENGINE

ing of steel. The method followed consisted in exposing the metal to the action of acid waters, and observing the reduction of weights. The results showed throughout that the proportion of phosphorus present exerted an appreciable influence on the behavior of the metal. Since rails in long tunnels are undoubtedly exposed to the action of dilute sulphuric acid, the phosphorus percentage may be accepted as one of the causes of their rapid oxidation, and Savioz' researches are accordingly noteworthy. The *Organ fuer die Fortschritte des Eisenbahnwesens* publishes two tables giving the results obtained by him. One set of tests was made with Bessemer and Siemens-Martin steel sheets of varying thickness and chemical composition, and the other with test pieces of similar material, two pieces being taken from each ingot, one from the upper and one from the lower end. The figures show

were instituted, was less affected than steel with 0.17 per cent. of phosphorus, but considerably more than steel samples ranging in phosphorus between 0.05 and 0.08 per cent. The tests, we should add, were made with a mixture consisting of one part of hydrochloric acid to five parts of water, and extended over 24 hours each.

It is reported that the present owners of the Shelby Iron Company, the producers of the well-known charcoal iron, at Shelby, Ala., are willing to sell their interest in that remunerative property, at a relatively low price.

The Standard Oil Company have contracted with the Riverside Iron Works, of Wheeling, W. Va., for 25 miles of steel pipe for one of their pipe lines near Warren, Pa.

## The Krupp Works at Essen.

The city of Essen lies northeast of Dusseldorf, and is reached from Brussels by way either of Cologne or Gladbach. It is situated in the fertile basin of the Ruhr, near Duisburg, another manufacturing city. Indeed, Essen is in the center of the great factory district of Westphalia, a veritable hive of industry, in which are also to be found Crefeld, Elberfeld and Dortmund. These are not the only noticeable features of Essen's position, for it lies in one of those fortunate regions in which Nature has stored abundant coal and iron, the very basis of metal working. To the Krupp Works Essen owes its world-wide reputation, and in a great measure all its prosperity. In 1862 its population scarcely reached 1700, but the number of workmen employed in the great foundry increasing from day to day, the little town did not cover sufficient ground to shelter them all, and rapidly expanded. In ten years the population doubled, and to-day, encircled by a belt of attractive suburbs, the old city contains nearly 100,000 people. The impression is at once received that the whole town is more or less dependent upon the works.

From a work recently published, entitled "Krupp and De Bange," we take the following data concerning some of the equipment of the furnace establishment. Though the description is not technically accurate and does not convey any new facts, it is vividly written and is interesting, as it reflects the impressions of one to whom the sights of a large works have not become a familiar matter:

In a part of the gun shop, first entered, the great guns are majestically enthroned; the leviathans of naval armament, the behemoths of coast defense. Man feels his insignificance in the presence of these awe-inspiring engines, yet he is their lord and master. Among all these finished masses of pure steel, at whose sides a horde of mechanics are busy, four especially rivet the attention of the beholder; they are the 40 cent. guns, 14 m. long, and weighing a trifle over 120 tons, say 120,000 kg. And yet but a few years ago the 100-ton iron gun with steel lining, made by Sir William Armstrong for the Duilio, was emphatically announced as the supreme effort in the struggle of ordnance against armor, the final outcome of constructive ability. Here the metal is not iron, but steel entirely, and crucible steel at that. The charge of each crucible is only 40 kg., and the reader can picture to himself the amount of work embodied in each of these pieces in remembering that the casting of each involves the simultaneous pouring of from 1700 to 1800 crucibles, yielding an ingot of 70,000 kg. As each gun consists of tube, mantle and rings, this Titanic operation must be repeated twice for each piece, as the rings alone permit the use of much smaller ingots. The ponderous blocks of steel required for these enormous guns are nevertheless forged and finished with comparative ease, so great is the capacity of Krupp's tools and so daring the intelligence which directs them. These guns were ordered by the Italian Government for the seacoast defense.

### THE CARRIAGE ASSEMBLING SHOP.

We regretfully left this interesting sight to enter another structure, in which are the assembling shops for naval and seacoast carriages. Communicating galleries are built at a height of 10 m. between the shops. From one of these we glanced above us at the traveling cranes of 50,000 and 30,000 kg. capacity, which, at a height of 15 m. and with a span of 22 m., traverse the great shops, lifting and shifting the heaviest masses, working automatically by bell signals. Below us we see in hand a carriage with rotating platform protected

by a sheet-steel cupola. This model is designed for a great ironclad, the pride of modern navies. Other carriages of established model, with hydraulic buffers and shot-cranes, are ready for the cars. Let us go down to get a nearer view of the work of assembling; let us see how the cupola turns on its rollers. Stop, it is moving. "She doesn't work badly," said the foreman, "a little filing here and there and she's all right." Above us the crane advances, goes back with impressive deliberation, making nothing of its huge loads, and, from time to time, the click of gearing and the ringing of a small bell reveal the existence of the train that moves this indispensable apparatus; and everything goes apparently in a routine way, quietly, without excitement or shouting; little is said in the Krupp establishment, but the work goes on all the same. At the four corners of the edifice ponderous lifts are installed, and, taken all in all, we are sure that there could not be a better disposition of the powerful mechanical devices which science has placed in the hands of the constructor. But let us hasten to examine the various processes of steel-making in use here, for the Essen Works turn out Bessemer, open-hearth, puddled and crucible steel.

### THE BESSEMER PLANT.

Bessemer steel is made on a great scale at Essen; 10,000 tons of rails can be made per month. This shows that Krupp is not unwilling to take advantage of scientific progress in whatever direction it tends, and does not disdain to make cheap steel to meet the wants of all railroad interests. But we must make no mistake; he uses the Bessemer process only for making commercial brands. Interested parties have started a rumor that the crucible steel, which alone is used for gun metal, is made in part by remelting Bessemer scrap. We have assured ourselves by watching the charging of crucibles that this rumor is entirely baseless. It would be still more audacious to assert that the converters furnish the ingots required for tubes, mantles or even rings, for we looked in vain for molds at the Bessemer works of sufficient size for the purpose, or for cranes powerful enough to handle the great blocks out of which the gun parts are fashioned. The fact is apparent that the works are especially equipped for the output of the small ingots required in rail fabrication.

### THE OPEN-HEARTH PLANT.

Krupp also makes steel by the Martin-Siemens process, which, besides affording facilities for determining the character of the bath by the drawing of test specimens, yields a more constant and homogeneous product than the Bessemer. It is slower, we must admit, but it is more certain; the carbon point can be so regulated that we can obtain the hardest as well as the softest metal, steel suitable for springs or for boiler plates. The open-hearth plant is extensive and well arranged. The reverberatory furnaces, in which the molten metal simmers under the action of the flame, are arranged in two rows, having between them cranes of medium capacity; under these are the casting pits. Here, as at the Bessemer plant, there is no sign that open-hearth steel is used for gun metal; no deep pits, no gigantic cranes. Not a particle of this steel goes into the crucibles; we assert this without fear of denial, for we have at hand convincing evidence. Open-hearth steel is used at Essen for the fabrication of all kinds of plate, tires, axles and other structural parts; also for all castings, such as car-wheels, crossheads, hydraulic cylinders, and, in general, for all machine members which do not need that absolute homogeneity and exceptional strength demanded by gun metal, and which so especially characterize crucible steel. As we

entered the foundry the work was in full swing; the furnaces flamed with dull crackling, and the crane moved along the great bay, holding suspended the pouring ladle; at intervals, when above the mold, a stream of molten metal gushed out momentarily, as with a lightning flash, making darkness visible, and disappeared in the glowing receptacle. In front of the works numerous castings, just from the molds, were slowly cooling under slag; they were truck-wheels. These castings are not to be trusted, inoffensive as they look; they remain hot for a long time, and those who walk about carelessly are apt to carry away ardent and lasting reminders.

### THE PUDDLED-STEEL PLANT.

It is easily understood that the portion of the establishment devoted to crucible steel making, the metal of which all Krupp guns are constructed, possessed the greatest attraction for us. Besides, with or without reason, all sorts of myths attached themselves to this mysterious metal, and the probabilities are that had the famous gun-maker lived in the dark ages his unlucky competitors would have accused him of witchcraft, and the stake would have effectually disposed of an inconvenient rival. The iron ores used by Krupp in the fabrication of his gun metal are of the very highest grade and of remarkable purity. As a rule, hematite and spathic ores are used, the same ores from which that excellent cast iron, called by Germans *spiegeleisen* and by the French *fonte miroitante*, is made. They come either from the Siegen region or from the firm's mines near Bilbao, in Spain. The iron is delivered at the works in pigs, and makes up the charge of the puddling furnace. The puddling is under control of experienced and tried workmen; indeed, a regular puddling school exists at Essen; no one can become a boss until, after numerous and difficult trials, he has proved himself thoroughly up in all the details of the art. Of course puddled steel is made at Essen upon the same scientific principles as in England, France or Belgium. While science is the same everywhere, each mill has its own special "knack" which characterizes its output. We will go a step beyond, and affirm that were Krupp to establish works in some foreign country, without taking with him his mechanics, his ordnance experts, and his foremen, many of them born within sight of his establishment, most of whom have grown gray in his service, the steel he would there make would be different from that produced to-day at Essen. The determining conditions are indigenous to the soil and dependent upon the generations of workmen evolved under their influence, just as the tree clings by its roots to its mother earth.

Let us, however, return to the iron about to be partially decarburized in the furnace. It is vigorously assailed by the fire, and thoroughly rabbled by the puddler; the excess of carbon is driven off, and the iron becomes steel. The skill of the puddler lies in stopping the operation at the exact moment when the iron comes to nature; if this passes the work is lost. The loop, or ball, as the spongy steel mass is called, is carried on a trolley to the steam hammer, the metal is squeezed under its blows, and slag and other impurities are expelled, the molecules are condensed, arranged, and rammed together, and the ball becomes a billet. This hammered billet is then taken to the rolls, and leaves them as a long, square rod, which is at once hardened in a pool occupying the center of the mill. Each rod, after critical inspection as to quality, is broken into pieces about 20 cm. long, which are sorted accordingly. The toughest and most homogeneous are reserved for gun-metal charges; the others are classed for special

work, such as crankshafts, axles, high-grade tires, &c. The advantage of this procedure is self-evident; the expert can, so to speak, after the crucible charge has been fixed, determine beforehand the strength which the melt will possess, and, as it is worked in small masses, there is the greatest possible chance of securing almost perfect compactness.

The puddling works always present a busy appearance; the steel bubbling in the furnaces is energetically stirred and worked by the rabbles of the puddlers. These are fine fellows, all nerve and muscle, whose perspiring faces, occasionally lighted up by a sudden flash of flame, bear testimony to the hardships of their trade. Here the steam hammers angrily pound the unwilling billets; further along the glowing bars writhe in audible agony through the roll grooves. Add to this the whirring of the pulleys, the clanking of the chains which hold the roll tongs that guide the heavy masses of steel, the calls of the bosses, the chant of the hundred ovens in which iron and coal crackle, the heavy puffing of the steam motors, and you have a picture in ever-varying colors of one of the most magnificent phases of modern industry. Puddled steel, which by the very principle and method of its fabrication is assured great uniformity, is the base of the crucible charge; the rest of the alloy is puddled iron. This is made of special pigs, and worked in the manner just described; it gives tenacity to the compound. It is rather refractory, but the puddled steel, the greater part of the charge, has a comparatively low melting point and a certain flux, one of Krupp's "secrets," is added. We came to the conclusion that charcoal was its main ingredient. The crucible, whose contents weigh exactly 40 kg., is carefully luted, heated in the warming oven and is then exposed to the high temperature of the melting furnace.

#### CRUCIBLE MANUFACTURE.

This is the proper time to speak of the melting pot, the crucible. It is made of a special composition, peculiar to the Krupp Works. We witnessed the manufacture, and came to the conclusion that the mixture consisted mainly of fire-clay with a less proportion of graphite. The material of which the crucible is made exercises a great influence upon the final constitution of the melted contents. Krupp has made this a subject of exhaustive investigation, for the works consume an enormous number of crucibles, as each can be used but once. No further evidence of this is needed than the piles of charged and broken pots stacked in the shop yards. A part of this waste material, however, is utilized; it is ground into powder under huge vertical stones, and is thus rendered fit for use in making new crucibles. New composition and old dust are ground fine, mixed in great vats and thoroughly worked up with the utmost care into a thick, pasty slip. The crucible is now to be molded. Imagine a hollow cast-iron truncated cone, the mold, and a solid metal core of suitable size and similar shape, which fit to just the dimensions of the prescribed crucible. Now fill the mold with the proper quantity of slip and slowly enter the core, the compressed plastic material flows between mold and core and shapes itself; the excess seeks to escape, but is held by a collar and forms the rim. The pot is then taken out of the mold and dried. The works, as already stated, consume daily a very large number of crucibles, for as a rule four crucible casts are made every 24 hours. The drying and storing rooms are in immense four-story edifices with spaced flooring, on which the crucibles stand in long rows. The superintendent of this important branch told us that there were already 100,000 crucibles in store, which are used in succession. We could not verify this

statement, but we are sure that it would have taken us hours, possibly a whole day, to count them.

#### THE CRUCIBLE-STEEL PLANT.

We come now to crucible casting, which in every way is the most singular, the most interesting and the most picturesque work we saw during our whole visit. The foundry stretches out almost interminably, and is furnished with all the apparatus necessary for the successful carrying out of this delicate and difficult work. Upon the extended sides, along the walls, are installed the gas heating ovens; parallel to them in two lines are built the melting ovens flush with the ground, and connected by subterranean galleries for the service of the attendants. The Krupp establishment uses in its crucible-steel plant about 130 coke and 80 gas ovens. Each oven has a capacity of 12 crucibles. Some, however, can hold 18, so that casts of from 1600 to 1800 crucibles, even more if necessary, may be easily undertaken. The largest steel blocks cast at Essen up to the present time weigh 70,000 kg., required in the construction of the 120-ton guns. About 1700 crucible charges were needed in casting them. Along the center line of the structure the casting pits are dug and the movable cranes are located. The process of casting is in itself of absorbing interest; it is a striking illustration of the precision and coolness of the master founder, of the discipline and skill of the workmen.

When the steel in the crucibles has reached the desired melting temperature, after being from four to five hours in the furnace, the master founder places the mold, as near as may be, equidistant from the active ovens. He then sets up the casting runners, heavy sheet-iron channels lined with fire-brick. These runners lead the liquid metal in corruscating streams to the gate which surmounts the mold in which they are engulfed. The foundrymen are dressed in two long lines, facing to the center, and divided into threes and twos. One of each three carries a tong, the others a rod, very much like a brewer's mash ladle. As soon as the master founder has completed his preparations, and upon inspection ascertains that the proper melting point has been reached, he gives the signal, the oven covers slide back and the casting begins. The melter with the tongs clasps the crucible, and resting the curved tong handle upon the rod, held by the other men as a fulcrum, he lifts it out of the oven. Keeping it vertical, the three place it on the ground some distance from the furnace. Then the other two take it, and pour its contents into the runner. The empty pots are thrown in a heap out of the way of the workmen. Group silently follows group; the crucibles shimmer through the foundry in a meteoric shower; the silence is broken only by the clatter of the sliding oven covers and the crackling of the molten streams as they glide in the runners toward the flask, into whose fiery mouth they plunge in a glittering cascade.

#### THE 50-TON HAMMER.

A word about the 50-ton hammer, so long the boast of the Krupp Works. Imagine a square steel head, 3.70 m. long, 1.50 m. wide and 1.25 m. deep, a mass of 7 c.m., hung at a height of 12 feet in an arch 5 m. high, whose supports are 1.50 m. in diameter. Now a steel anvil, resting upon successive foundations of masonry, oak—a whole forest was required—and cast iron; finally, in your mind's eye, put the glowing ingot under the hammer head. The hammer boss, a veteran artist in blue glasses—for it is impossible to watch the incandescent mass with the naked eye—is in direct charge. At his right and left are the men who grasp the chains encircling the monster, and who, at a hand wave, without a word or order, oscillate the block until the desired position is at-

tained. The hammer slowly descends, the head hardly touches the ingot, then, after a rapid inspection, it is quickly raised and comes down with all its might upon the metal, which quivers and gives under its terrible blows. About the hammer the ground trembles as with an earthquake wave. Stop! the hammer rests, the block is turned on its side, the machine takes breath again, like a Colossus raising his club to brain the enemy, and pounds again upon the bruised mass, which finally gives way under this storm of blows; the block is forged.

The 50-ton hammer was built about 20 years ago and cost the small sum of \$500,000, but it must be admitted in excuse that it earns its living honestly and pays good interest on its cost. At that time Creusot had only a 12-ton hammer; however, there are 80 and even 100 ton hammers. "Why," it is asked, "does Krupp suffer himself to be outdone by his rivals?" We must first note that the Essen hammer has really an effective weight of 60 tons, and the heaviest blocks forged weigh, as already mentioned, 70,000 kg. These blocks are bored; the forging can therefore be altogether effective, for the hammer blows need not penetrate to the heart of the block. Further, the monster guns now constructed date back only a few years. Altogether, up to the present, more powerful mechanical contrivances were not required; yet for some time past Krupp has contemplated erecting a hammer of much greater weight, and the matter is so far advanced that within a few months Essen will again surpass its rivals in its ability to forge the very heaviest steel masses. It would hardly be proper for us to say more on this subject. After forging the shapes are subjected to a peculiar annealing process, and are then transferred to the gun-shops for finishing and assembling. We will not dwell upon the other products of the works—steel cast wheels, coil and elliptical springs, tires, &c.—all abounding in interest, and which in themselves justify Krupp's great reputation. We examined the entire plant with sustained interest, but we cannot within the scope of this paper undertake to impart our impressions.

The theory of Dr. F. C. G. Mueller concerning the character of the gas occluded in steel has been confirmed in a striking manner. The inventors of the famous Mannesmann method of making steel tubes, by rolling them excentrically from a solid bar, sent to the Charlottenburg laboratory two tubes closed at both ends, a partly finished product, therefore. The steel contained 0.46 carbon, 0.25 silicon, 0.022 phosphorus, 0.01 sulphur, 0.23 manganese and a trace of copper. The hollow cavity contained 9.11 c. cm. of gas at a pressure of 760 mm. Chemical analysis showed that this gas was composed of 99 per cent. of hydrogen and only 1 per cent. of nitrogen, confirming Mueller's theory that the gas occluded in steel castings is hydrogen.

An important act for the protection of minority stockholders and the securing of publicity in corporate affairs has been passed this month by the Legislature of Massachusetts. Hereafter the officials of every company chartered in that State will be required to file at the State House, on the request of any stockholder, between 30 and 60 days before its annual meeting, complete lists of the shareholders, with their residences and the number of shares belonging to each. These statements are to be made in a form approved by the commissioner of corporations, and are to be sworn to. The penalty for neglect to file the required lists is a fine of \$1000 against the corporation and the same sum on the delinquent official.

**New Punching Press.**

The accompanying engraving represents a new punching press built by E. W. Bliss Company, of Brooklyn, N. Y., intended for use in the manufacture of iron boilers, tanks, smoke-stacks, and other sheet-iron and steel work. With it holes can be

plied for a patent, which was still pending; that his furnace bore the device "Patent applied for," and that the manufacture of the furnace by the defendant was an infringement. In dealing with the case whether an inventor can maintain a bill for an injunction before the issue of a patent, Judge Brown decided adversely,

tion is simple and places the engine under quick control. These engines are made in sizes from  $\frac{1}{4}$  to 20 horse-power.

**The Boiler-Makers' Meeting.**

In response to a call issued by A. T. Douthett, secretary of the Porter Foundry and Machine Company, Limited, of Allegheny City, Pa., the boiler manufacturers of the United States met at the Hotel Anderson at 9 o'clock a.m., on Tuesday, the 16th inst., and at once proceeded to organize themselves into an association. James Lappan, of Pittsburgh, was chosen president; A. T. Douthett, of Allegheny, Pa., secretary, and Messrs. Rohan, St. Louis; Marshall, Dayton, Ohio; Cunningham, Brooklyn, N. Y., and Hartley, Philadelphia, Pa., vice-presidents. Committees on organization and resolutions were appointed, consisting of the following members: Messrs. E. D. Meier, J. R. Brownell, R. Hammond and James Barnhill, organization; Philip Rohan, Geo. Marshall, H. J. Hartley, John Over, J. P. Jefferson, R. Monroe and A. T. Douthett, resolutions. After the appointment of these committees the meeting adjourned until 2 o'clock p.m.

The convention upon reassembling in the afternoon received the reports of the committees appointed in the morning. The Committee on Permanent Organization made quite a voluminous report, the substance of which will be given hereafter in the constitution and by-laws. The resolutions drafted by the committee appointed for that purpose made the following report, which was unanimously adopted:

**WHEREAS**, No business calls for greater care, better material in the construction of its commodity and more exact workmanship than ours; and in view of the fact that so many disastrous explosions have occurred in the past where materials afterward tested have been shown to be of an inferior quality; therefore, that we may better secure safety to the lives and the property of every community where boilers are used, be it

**Resolved**, That we will in all cases use the best material in the construction of boilers, refusing to accept contracts where specifications do not call for material of suitable quality.

**Resolved**, That it is the sense of this convention that the system of inspection prescribed by the United States marine laws should be adopted with but few exceptions.

PUNCHING PRESS, MADE BY THE E. W. BLISS COMPANY.

punched in sheets 24 inches from the edge, and when the stay-bolts are used heavy sheets may be punched 7 inches from the edge. The machine is also useful in riveting iron lattice and framework as used in fitting up offices, elevator shafts, &c. The wheel is 54 inches in diameter, weighs 900 pounds, and is locked to the forged steel shaft by a new patented clutching device that is positive in its action and exceedingly powerful. Four locking grooves are provided in the hub of wheel, thus preventing any loss of time in starting, and a friction collar on the shaft insures the stopping of the slide at the top of stroke every time. When made as shown in cut its weight is 4500 pounds, and when geared for heavy work it weighs 5500 pounds.

**"Patent Applied For."**—A practice widely followed is to attach to an article manufactured the words "Patent applied for," with the idea that it protects the invention until a patent is issued. In the United States District Court at Detroit Judge Henry B. Brown has just rendered a decision bearing upon the value of this system. The case in which the question arose was that of Barnard Rein and Asa W. Straight *vs.* Clayton and Lambert. It appears that in August, 1887, Straight went to Clayton, who at one time was employed as foreman of Drury & Taylor, and showed him a burner invented by him for use as a vaporizer on a gasoline stove, to be applied to plumbers' hand furnaces. Clayton made one, which he used for some time. In the spring of 1888 Clayton went into business for himself, and as an adjunct commenced making furnaces for Straight, adding some improvements on it. The exclusive sale of the furnace was given to Lambert & Sons, and as great improvements, in addition to others, suggested themselves to Clayton, he resolved to make a furnace of his own, and in September, 1888, took Lambert & Sons in with him and commenced to make furnaces, having applied for a patent on the same. Straight asked for an injunction to restrain Clayton & Co., alleging that he had already ap-

entering a decree denying the injunction and dismissing the bill for want of jurisdiction.

**Launch Engine.**

The engine of which we herewith present an outline drawing is manufactured by Lombard Bros. & Co., of Boston, the sole agent being John J. Bockée, of 47 Dey street, New York. The bed of the engine is cast in a single piece, the angle being such as to conform as closely as pos-

LAUNCH ENGINE, BUILT BY LOMBARD BROS. & CO.

sible to the sides of the boat. By this construction the shaft is brought to the lowest possible point in line with the keel, while at the same time the bed acts as a brace or stiffener to the boat, thereby increasing its strength at that point where the vibrations and weight make it most needed. The cylinders being arranged at the angle shown in regard to each other, there is no dead-center. The valve eccentric is so connected by feather and spiral groove as to be shifted by the movement of a centrally-placed lever. The engines can be started, reversed and stopped by the movement of this bar, which controls the relative position of the valves. The construc-

**Resolved**, That we recommend all manufacturers of iron and steel boiler plate to make but one brand, which shall have a tensile strength of not less than 55,000 or more than 65,000 pounds to the square inch, and that the same be stamped with the initial letters found in the name of this association—viz., A. B. M. A., and that this brand be sold to the members of the organization only.

**Resolved**, That we use all honorable means in influencing our representatives in Congress to procure the passage of such laws as will make it a criminal offense, punishable by fine and imprisonment, to manufacture or sell iron or steel of an inferior quality for boilers, and a similar offense, punishable in like manner, to make boilers for any purpose of an inferior quality to those specified by such laws.

**Resolved**, That we invite all manufacturers of boilers to join our association, knowing as

we do that our object is purely philanthropic, and that we are bestowing one of the greatest blessings upon the public at large, who should look with distrust upon any manufacturer who, by reason of personal motives, refuses to take this important step.

At the evening session the Committee on Constitution and By-Laws, consisting of Colonel Meier, P. Rohan, Brownell and Bornhorst, presented the following, which was adopted:

Constitution and By-Laws of the American Boiler Manufacturers' Association. Adopted at Pittsburgh, April 16, 1889.

For the purpose of affording means of ready consultation, and of united, intelligent and effective action on matters of mutual interest, the undersigned, American Boiler Manufacturers, hereby associate themselves together and agree to be bound and governed by the following constitution and by-laws:

#### CONSTITUTION.

##### ARTICLE I.

Name.—The name of the association shall be the American Boiler Manufacturers' Association.

##### ARTICLE II.

Its objects are

1st. To establish such standard for materials and workmanship as will insure uniform excellence of construction of all American boilers, and thus secure safety to the lives and property of all communities where boilers are used, and to procure the passage of laws making the manufacture, sale or use of inferior materials criminal offenses.

2d. To concert such measures and take such action as shall be for the interest and advantage of its members, especially,

3d. To procure and furnish to its members statistics of the trade, domestic and foreign, and

4th. To take such action as shall from time to time be deemed advisable regarding the regulation of prices and production.

##### ARTICLE III.

Membership.—Any firm, corporation or individual manufacturing boilers who shall take part in the adoption of this constitution shall hereby become a member of this association, and thereafter any such manufacturer may become a member upon application to his State Committee in writing, agreeing to be bound by this constitution and paying the initiation fee.

##### ARTICLE IV.

Officers.—The officers of this association shall be a president, three vice-presidents, a secretary and a treasurer. These officers shall together constitute an executive committee. The duties of said officers shall be such as usually appertain to their offices, and such as shall be set forth, stated and fixed by the by-laws of this association, or such as may from time to time be imposed upon them by the association.

##### ARTICLE V.

Assessments.—The expenses of this association shall be met by initiation fees and by assessments levied from time to time, as regulated by the by-laws.

##### ARTICLE VI.

State Committees.—Each State in which at least three members of this association are located and in which they employ not less than one hundred (100) boiler-makers shall be entitled to a State Committee of not less than three nor more than five members, who will organize by electing from their number a chairman and a secretary, who shall at once notify the president of the association of such action. Members in such States where there are no State Committees may attach themselves to the nearest State Committee.

##### ARTICLE VII.

All questions affecting the boiler trade or connected with the welfare of this association shall be submitted to the vote of the association by letter ballot through the State Committees by the president on resolution of the Executive Committee. It shall further be the duty of the president to submit such matters in the same manner on the written request of any five members of the association.

##### ARTICLE VIII.

Amendments.—Any changes in our amendment to this constitution may be made at any regular meeting of the association, provided at least one month's notice has previously been given by circular to the members—absent members voting by letter ballot, or by letter ballot after like notice, the ballots being canvassed by a majority of the Executive Committee. A two-thirds vote of the whole association shall be necessary to carry any such change or amendment.

##### BY-LAWS.

Section 1. The officers of the association, after those elected at the time of organization, shall

be elected by ballot at the regular meeting, to be held on the first Tuesday in February of each year, and shall hold their respective offices for one year, or until their successors are elected and are ready to enter upon the duties of their respective offices.

Sec. 2. The president shall preside at all meetings of the association, shall be entitled to vote on all questions coming before the association, and shall perform all other duties incident to the office of president.

Sec. 3. The vice-presidents in the order of their election shall, in the absence of the president, perform the duties of the president, and in the absence of the president and vice-presidents a president *pro tem.* shall be elected from the members of the association present.

Sec. 4. The secretary shall have charge of all papers and a memoranda belonging to the association, keep a correct method of all its proceedings and act as secretary of the Executive Committee. He shall also communicate to all members of the association, through the State Committee, such action and information relative to meetings, reports, statistics, &c., or other matters affecting the common interest as he shall be in possession of. He shall also perform such special duties as may be assigned to him by the association, the president or the Executive Committee. The salary of the secretary shall be \$3000 per annum, payable monthly; he shall also be paid his expenses when traveling on the business of the association.

Sec. 5. The treasurer shall receive and have charge of all moneys of the association, shall keep a correct account of the receipts and expenses and shall present a detailed statement of the same, with the proper vouchers therefor, annually at the meeting in February and whenever called upon by the association. The treasurer will pay out money only to the order of the president countersigned by the secretary. The treasurer is to give a bond of \$5000 for the faithful performance of his duties.

Sec. 6. The initiation fee is to be \$25. The Executive Committee may fix assessments from time to time, not exceeding \$20 in any one year.

Sec. 7. The Executive Committee in the intervals between the meetings of the association shall have the authority to take such action as they may determine upon in furtherance of the general objects, reporting such action to the next meeting of the association, or by circular through the State Committees. They shall also perform such duties as may from time to time be imposed upon them by the association.

Sec. 8. Any vacancy in any office, however occurring, shall be filled by the Executive Committee at their next meeting after the vacancy shall have occurred.

Sec. 9. The meetings of this association shall be held in various parts of the country; the point for each annual meeting to be chosen at the preceding meeting.

Sec. 10. These by-laws may be altered or amended by a simple majority of those voting by letter ballot on one month's previous notice by circular.

Philip Rohan moved that the secretary, or some other person appointed by him and other members of the Executive Committee, receive \$1000 and all expenses while traveling for the period of six months, that all those desiring to join the organization might have an opportunity of knowing its purpose.

Motions to furnish all boiler manufacturers with a report of this convention, that a certificate of membership be given to those joining the association, that the next meeting be held in Pittsburgh, October 15, 1889, that the invitations of Carnegie, Phipps & Co., Park Bro. & Co. and National Tube Works be accepted, were adopted in quick succession.

Just before adjourning Col. E. D. Meier, of St. Louis, Mo., presented the following resolutions, which were unanimously adopted:

Whereas, Thorough uniformity in the construction of boilers can only be attained by a careful consideration of all the elements which together make up the sum of perfect materials and workmanship; and

Whereas, In these important matters the individual knowledge and experience of all members of the A. B. M. A. should be collected, arranged and compared before intelligent discussion and conclusions become possible; therefore, be it

Resolved, That the president shall at each regular meeting appoint committees of from three to five members each, well distributed territorially, whose duties shall be to collect and tabulate these data in the form of reports, to be submitted for discussion at the meeting next following; and that he shall also appoint

such committees in the interim between regular meetings when requested by at least five members to do so, provided, however, that such committees are to have at least three months' time to complete their work; and provided, further, that no standards shall be adopted unless agreed to by a two-thirds vote of the whole association. Every such committee, as soon as organized, shall prepare a circular calculated to draw out from all members their best thought on the subject in hand, which is to be transmitted through the secretary of the association to each member in the manner prescribed by the by-laws, such circular to state the latest date on which replies may be made, and that the committees may, if they see fit, send such circulars also to others versed in these matters; and be it further

Resolved, That the president appoint the following committees:

1. On proper specifications for materials and tests of same.
2. On proper rules for riveting and calking.
3. On proper dimensions and construction of manheads and manholes.
4. On braces and stays.
5. On methods of attachment of valves, gauges and fittings.
6. On safety valves.
7. On uniformity in State boiler inspection laws.

Mr. J. C. McNeil, of Akron, Ohio, moved that a committee be appointed to investigate the tube question.

H. R. Barnhurst, of Erie, moved that a committee be appointed to decide the number of square feet per horse-power.

Among the prominent people present from a distance were I. P. Morris & Co., H. J. Hartley, Philadelphia; Philip Rohan, St. Louis; George Marshall, Dayton, Ohio; Christopher Cunningham, Brooklyn; R. Hammond, Buffalo; J. R. Brownell, Dayton; Col. E. D. Meier, St. Louis; James Barnhill, Bellaire; Novelty Steam Boiler Works, Brooklyn; Heine Safety Boiler Company, St. Louis; James T. Dougherty, Dayton; J. L. Shanks & Co., Salem, Ohio; James F. Wangler, St. Louis; Charles Miller, Beaver Falls; Struthers, Wells & Co., Warren, Pa.; Alonzo L. Cady, Steubenville; Lovegrove & Co., Philadelphia; Wilfong Brothers, Philadelphia; Stearns Mfg. Company, Erie, Pa.; A. R. Barnhurst, Erie; J. C. McNeil & Co., Akron; Farrar & Trefts, Buffalo; John H. Collins, Amsterdam, N. Y.; Tippet & Wood, Phillipsburg, N. J.; G. N. Barnes, Corry, Pa.; Thomas S. Driscoll & Co., Columbus, Ohio; Corry City Iron Works, Corry; Booger Brothers & Co., Columbus; Cleveland Steam Boiler Works, Cleveland; Wm. T. Bate & Son, Conshohocken, Pa.; Cox & Morrison, Wheeling; H. Holdane, Reeves Bros., Niles, Ohio; Charles Heinz, Dayton, Ohio; D. Conley, Cleveland; John Over, Philadelphia; J. P. Jefferson, Warren, Pa.; R. G. Morrison, Sharon; Richard Garstang, St. Louis.

Firms who were unable to be represented, but who have signified by letter their intentions of becoming members, are:

Bartlett, Hayward & Co., Baltimore; Excelsior Iron Works, Chicago; Daniel Kelly, Philadelphia; Geo. E. Tift, Sons & Co., Buffalo; Summit City Boiler Works, Akron, Ohio; Ames Iron Works, New York; Erie City Iron Works, Erie; Jas. Russell & Sons, South Boston, Mass.; Buckeye Engine Company, Salem, Ohio; Henry Worden, Philadelphia; Best Steam Engine and Boiler Works, Lancaster; Porter, Jackson & Co., South Chicago; A. J. Brown, Paterson, N. J.; Hugh Leslie, Jersey City; Geo. Strecker & Co., Marietta, Ohio; Alliance Steam Boiler Works, Alliance, Ohio; Cox & Sons, Bridgeton, N. J.; Frick Company, Waynesboro, Pa.; L. J. Lyons & Co., Newark, N. J.; Middleport Boiler Works, Middleport, Ohio; Gorman & Pettit, Alexandria, Va.; Connery Boiler Company, West Philadelphia; Johnston Bros., Ferrysburg, Mich.; Porter Manufacturing Company, Syracuse, N. Y.; South Bend Boiler Works, South Bend, Ind.; The Bigelow Company, New York City; National Water

Tube Boiler Company, New Brunswick, N. J.; A. B. Farquahr & Co., York, Pa.; The Globe Iron Works Company, Cleveland; Tudor Boiler Manufacturing Company, Cincinnati; Reeves Bros., Niles, Ohio; Armstrong Bros., Springfield, Ohio; Taylor Manufacturing Company, Chambersburg, Pa.

The following are the committees appointed:

Committee on Materials and Tests: E. D. Meier, St. Louis; Richard Hammond, Buffalo; H. J. Hartley, Philadelphia; J. R. Brownell, Dayton, Ohio.

Committee on Proper Rules for Riveting and Calking: Robt. M. Connery, Philadel-

Committee on Uniformity in State Inspection Laws: Geo. Marshall, Dayton, Ohio; Thos. G. Lovegrove, Philadelphia, Pa.; Christopher Cunningham, Brooklyn, N. Y.; G. N. Barnes, Corry, Pa.; Philip Rohan, St. Louis, Mo.

### Sectional Boiler.

The steam generator of which we herewith present an engraving taken from our contemporary *Engineering* is the invention of Charles Ward, of Charleston, W. Va. It consists of 12 vertical pipes arranged in a straight line, six at each side

N. From these it proceeds into the drum L, where the steam is separated by a number of perforated diaphragms on its way to the pipe J. The water descends through the drum and repeats the circuit. The semicircular tubes are connected to the vertical pipes by right and left hand steel bushings, as shown by the detail view. The following are the particulars of this boiler:

Heating surface.....	1311 square feet.
Grate area.....	42 "
Number of tubes.....	288
Outside diameter of fire-box..	8 feet 7 inches.
Height of casing.....	7 " 3 "
Diameter of drum.....	2 " 4 "
Height.....	10 " 6 "
Total weight of boiler.....	8 tons.

This boiler is made in 15 sizes, varying from 660 square feet of heating surface to 2432 square feet.

### Building and Loan Associations.

Building and loan associations had their origin in Philadelphia, where the earliest one was organized in January, 1831. The majority of those formed at first were unincorporated. A few of them were organized under special acts. A general act authorizing their incorporation was passed in 1850. At first the number of shares was limited, but in 1874 this limit was removed, with the proviso that the aggregate capital of an association should not exceed \$1,000,000. It was estimated by the Secretary of Internal Affairs of Pennsylvania in 1879-80 that the associations in Philadelphia had been the means of making 80,000 people owners of real estate. The number of associations in Pennsylvania at present is estimated at 900, the aggregate capital at \$65,000,000, and the total savings paid into the associations in a year at over \$17,000,000. In New York associations were formed as early as 1849, and a general act authorizing their incorporation was passed in 1851. The first ventures in New York City were unfortunate, and the system died out there after a few years, not to reappear until 1885, since which time there has been a marked revival. A general act providing for their incorporation was passed in 1887. The system has extended to other States, among them being Massachusetts, Ohio, Illinois, Wisconsin, Michigan, Minnesota, Indiana, Iowa, Kansas, Missouri, California, Louisiana and Texas. The total number of these associations in the United States is estimated by Seymour Dexter, in an article published in the *Quarterly Journal of Economics*, at about 4000, the accumulations held by them at about \$300,000,000, and the amount which will be paid in the form of dues during the current year at about \$65,000,000. Touching the economic advantages of these associations, Mr. Dexter says that as an institution for savings no scheme has yet been devised and put into operation which combines safety of the funds, cheapness in management and good rates of interest in so great a degree. Further, he says that these associations can be conducted successfully in any business center having a population of 500, and thereby the benefits of an institution for savings can be secured by the many villages that have not sufficient population to maintain a savings bank, while as a means for stimulating savings such associations are more potent than savings banks themselves, owing to the fact that while a man is a member he is compelled to deposit a certain amount at fixed periods, while he is at liberty to withhold his deposits from the savings banks.

Only a few heats were made on the Bildt process at the Troy Works, nor was the steel produced carried as low as it is possible to go, the carbon contents of the steel ranging between 0.06 and 0.09 per cent.

WARD'S SECTIONAL BOILER.

phia; John MacCormack, Albany; J. Mathews, South Bend, Ind.

Committee on Manheads and Manholes: Jos. F. Wangler, St. Louis; A. Wilfong, Philadelphia; J. S. Shanks, Salem, Ohio; Luther Allen, Cleveland, Ohio; R. Munroe, Pittsburgh, Pa.

Committee on Bracing and Stays and Proper Tube Spacing: J. C. McNeil, Akron, Ohio; J. P. Jefferson, Warren, Pa.; Henry Warden, Philadelphia.

Committee on Attachment of Valves and Fittings: Richard Garstang, St. Louis; Thos. S. Driscoll, Columbus, Ohio; Geo. S. Barnum, New Haven, Conn.

Committee on Safety Valves and Horsepower: H. R. Barnhurst, Erie, Pa.; Chas. F. Foster, St. Louis, Mo.; J. W. Wood, Phillipsburg, N. J.; John Trefts, Buffalo, N. Y.

of a central drum. Each pair of vertical pipes is joined by 48 slightly inclined tubes, each forming nearly a semicircle. There are, therefore, six concentric sections of tubes, two only of which are shown in the illustration. The vertical pipes are joined to large horizontal pipes at the lower ends, and one set of them is connected at the upper end to a horizontal pipe in communication with the central drum. The following is the mode of operation: The feed water is introduced to the central drum by a pipe ending in rose A; it descends slowly, becoming heated in its passage, and deposits its mud at the bottom of the drum. It then enters the horizontal pipe G (called by the inventor a "manifold") and rises up the vertical pipes E until it can escape through the curved tubes G G into the vertical pipes

### The Western Wages Scale.

In a little more than a month the wages scale question will come up before the Western iron manufacturers and the Amalgamated Association of Iron and Steel Workers. The scale now in force pays \$5.50 per ton for boiling on a 2-cent card, and will expire on June 30 next. Considerable interest is already being manifested concerning the question whether the manufacturers will act on their individual responsibility or whether they will appoint a conference committee, as they did last year. Then the manufacturers had an association known as the Association of Manufacturers of Iron, Steel and Nails, the sole object of which was to deal with labor and wages questions. The members composing this organization prepared a scale last year based on \$5 per ton for puddling on a 2-cent card, and it was given out that every member had pledged his word to stand out for the enforcement of this scale. When July came several of the manufacturers at once signed the Amalgamated scale and proceeded to start up their mills. This action caused considerable ill feeling, and charges of bad faith were made, with the result that the manufacturers' organization was broken up and a number of its former members stated that in the future they would act on their own responsibility in settling wages questions. Up to the present time no attempt has been made to reorganize this association, and from present appearances the conference committee of the Amalgamated Association will have to present their scale to the manufacturers individually this year. While it is true there is plenty of time remaining for the manufacturers to organize, it is also true that there are a number who will refuse to join any organization that may be formed. It is the impression that the lack of organization will very materially weaken the position of the manufacturers and give the workmen a decided advantage if a conflict should take place. While nothing definite can be said at this time as to what demands will be made by the parties interested, it is believed that the workmen will present practically the scale now in force, while hints have come from certain quarters that the manufacturers will demand a very material reduction. The question has already been brought up of closing down the mills during the months of July and August, and is being agitated principally by the workmen, who state that a complete shut-down for those months would allow the manufacturers to reduce their stocks and also give the workmen a much-needed rest. Some of the manufacturers view this proposition with favor, while others state that they will not agree to it, for the reason that they would be in danger of losing their trade. It is a well-known fact that there are certain concerns in the West so situated that it is an impossibility for them to close down their plants for a length of time, and these concerns are always among the first to sign the scale rather than submit to a shut-down. The developments of the next few weeks will no doubt throw considerable light on this important question.

### Basic Steel for Horseshoe Nails.

—Some time since Moeller, one of the leading horseshoe nail manufacturers of Germany, declared that after a thorough test his firm, Moeller & Schreiber, of Eberswalde, had reached the conclusion that the only trustworthy material is Swedish iron. Without being discouraged by an earlier failure the Peiner Walzwerke, of Peine, Germany, undertook recently to meet the requirements. They sent a lot of basic steel to the Government testing establishment at Charlottenburg, where

elaborate tests were made. From a detailed report made by Dr. Wedding it appears that the material proved fully the equal of the Swedish iron. We believe that in this country mild steel has also been used with some success in manufacturing horseshoe nails.

### New Shear Press.

The accompanying engraving shows a new and recently-designed shear press which has just been put on the market by the Coulter & McKenzie Machine Company, of Bridgeport, Conn. One of the

and ratified by the United States Government last year after some hesitation. That treaty provides that the subjects or citizens of each of the contracting Governments shall enjoy in all the other countries parties to the convention the same advantages that the respective laws thereof accord to their subjects or citizens so far as concerns patents for inventions, trade and commercial marks and the commercial name. One of the features peculiar to the American patent system, which does not seem to have been closely considered in framing the treaty, gives to citizens of the United States and aliens who have resided for one

SHEAR PRESS, BUILT BY COULTER & MCKENZIE.

main features of the press is the loose pulley, which is the same size as the balance-wheel, and the use of which dispenses with the separate counter-shaft. The knives are made extra strong, and can be used with more economy than formerly. The cuts being long makes large wearing surfaces. The connection is all in one piece, with bearings of unusual length, and the whole machine is strong and solid. It will be observed that this machine requires no expensive foundation. This press was designed expressly for the Spring Perch Company, of Bridgeport, for clipping the ends of steel plates. The same pattern is also used for heavy punching. It weighs 3700 pounds.

An interesting question arose recently regarding the effect of the international convention for the protection of industrial property, proclaimed at Berne in July, 1887,

year in the country and have made oath of their intention to become citizens, the privilege of filing caveats for uncompleted inventions. A citizen of Switzerland, relying on the provision in the treaty above mentioned, lately presented a caveat for an incomplete invention, asking that it be placed in the secret archives of the Patent Office, as provided in the case of citizens. The Patent Office declared that it had no power to receive the caveat under existing laws, holding that while the terms of the convention might be construed to extend the right claimed to the subjects of the signatory Governments, it could only be done after action by the legislative power. This decision of the Patent Office has just been sustained after examination by the opinion of the Attorney-General, who holds that the treaty is not self-executing, but requires legislation to render it effective for the modification of existing laws.

## THE WEEK.

New Haven will expend \$500,000 on the construction of a water reservoir at Woodbridge, on the West Haven River, 6 miles from the city.

The Cunard steamer Umbria made her last trip from New York in 6 days 2 hours and 25 minutes. Three months ago she made about the same time.

Some of the latest-built gunboats, like the French torpedo-boats, are provided with armaments disproportioned to their tonnage, and fears are expressed that some of the American boats after the same model may be equally at fault. Recent reports of the maneuvers of the British naval fleet show that the six vessels of the Archer type pitched and rolled about to such an extent in a moderately heavy sea that the guns were so unstable that they could not be directed with any approach to accuracy of fire. The significance of this report to naval officers here lies in the fact that the new gunboat Yorktown is patterned after the Archer and will carry the same caliber and weight of ordnance. Failure has also attended the efforts of the British constructors to build a 20-knot ship, of which the Navy Department at Washington is attempting to build two under the direction of act of Congress. The Medea, which was built for a 20-knot ship, has never exceeded 19 knots. Other vessels of the same type have failed to develop anything like 9000 horse-power.

Retaliation on the part of Canada may be expected should it prove true that Canadian freight cars coming into the United States and running over United States railroads will now have to pay the regular rate of duty at points of entry. The Treasury Department, it is reported, has had the matter under consideration for some time—in fact, ever since the fisheries trouble. An account kept at some points of entry shows that an average of 300 such cars come in daily at Detroit and Port Huron, Mich., and at Niagara Falls, and that fully 3000 dutiable Canadian cars are in constant use on roads in the United States.

One of the gunners on board the United States warship Trenton, before she was dashed on the reef at Samoa, describes the fury of the tempest. He says: "We were steaming at the rate of 10 knots and had five heavy anchors down. All the vessels had all their masts and yards down, and were making a heroic struggle for existence. The ship seemed fairly to leap out of the water. At times the bows would be lifted entirely out of the water so you could see half their keel."

The total shipping tonnage on the American lakes is shown by the registry of the marine underwriters to have a value of \$43,522,700, exclusive of new craft on the stocks and coming out this season. The vessels are classified as follows:

Class.	Number.	Tonnage.	Value.
Tugs.....	418	11,369	\$2,194,400
Propellers.....	548	361,920	31,124,300
Side-wheel steamers.....	87	14,649	1,798,000
Schooners.....	872	167,890	4,988,000
Lake barges.....	301	129,043	3,414,000
St. Lawrence River barges.....	2	386	4,000
Totals.....	1,678	675,407	\$43,522,700

Including new additions and vessels which have no ratings, the total value is believed to be nearly \$50,000,000.

The difficulties between England and Venezuela being no nearer a settlement than ever, the Venezuelan consul in New York departs from the usual forms of diplomacy by making a public statement in which he says: "England has taken advantage of her superior forces to seize Point Barima, over which Venezuela has always held undisputed sway. The pos-

session of Point Barima implies the entire control of the mouth of the Orinoco, consequently of the whole river, and the river forms, with the Amazon and the Plata, the prodigious fluvial net of South America, connecting with each other through all its different branches some well-known rivers and others yet unexplored. Thus the ruler of the Orinoco can travel to Colombia by the Meta, to Peru and Bolivia by the Ucayale, to Ecuador by the Mapo and the Branco, to Brazil by the Rio Negro, Marañon and Branco; to Paraguay and Montevideo by the affluents of Marañon, and all that is lacking is a communication for a distance of about 12,000 yards in order to communicate with Buenos Ayres."

The Florida land investments of the Disston saw manufacturers are resulting in an important addition to the productive sugar regions of the South. A new factory opened at Kissimmee this season is said to have turned out 1,500,000 pounds of sugar from 8800 tons of cane, a yield exceeded by only three of the thousand sugar factories of Louisiana. A New Orleans paper says: "There is no telling what the extension of the Florida sugar interest may be, now that machinery is reclaiming the rich sugar lands of that State. Texas claims to have 400,000 acres of fine sugar lands in the lower part of the Brazos Valley, and is rapidly developing the industry in that region, where a central factory is claimed to have made last year a larger crop than that manufactured from any single estate in Louisiana. The capacity of Florida for sugar production is yet unknown, though it may equal that of Louisiana."

The Beet Sugar Company has been incorporated in San Francisco, with a capital of \$5,000,000, the Spreckels holding half of the stock. The object is to erect large sugar refineries at various points on the coast, in addition to one already established at Watsonville, Cal., in the expectation of refining 50,000 or 60,000 tons of sugar a year.

The cost of the Paris Exposition this year is expected to be \$10,000,000, of which fully one-half will be borne by the Government.

The lamentable death of Postmaster Henry G. Pearson, after many years of unswerving fidelity in public service, leaves the position vacant until May 1, at which time the postmaster-elect, Cornelius Van Cott, will enter upon his duties. Meanwhile, ex-Postmaster-General James is acting postmaster at New York.

Liverpool, England, is to have an elevated railway on the line of the docks, about \$2,000,000 having been promptly subscribed for this purpose. It is safe to predict that New York City will eventually be provided for in like manner, so that pedestrians and vehicles will no longer be intermingled at the various ferry landings on the same level.

The New York Nautical Schoolship St. Mary's has received about 90 applicants for instruction in practical seamanship and will soon have her full complement of 125. The Philadelphia Schoolship Saratoga is being similarly organized.

The American adviser to the Korean King, O. N. Denny, is reported to have resigned his position, and, according to a telegram from Seoul received in Yokohama, the consideration was \$30,000, received from Li Hung Chang, representing the Chinese Government, to whom Judge Denny's presence has been an offense.

The Board of Bureau Officers which has been considering the proposals received for building the armored coast-defense vessel has completed its work and reported to the Secretary of the Navy. It is understood that the board finds that it

is not possible to build the vessel under the lowest bid (\$1,614,000) and comply with the terms of the act of Congress, which fixes the total cost of the naval rams, batteries and other naval structures to be built under its authorization at \$2,000,000. Out of this total must come the armor for the coast-defense vessel, which is not to be furnished by the contractor, and which will cost \$350,000, anchors, boats, &c., and the submarine boat for which proposals were received some months ago.

The Boston Navy Yard has been practically idle for several years on account of the lack of Government work and because the great bulk of construction has been given to private firms. Boston realizes the advantages to be obtained by having built at that yard one of the new big cruisers to be begun during the summer, and efforts will be made to have it assigned there.

Oil lands in Ohio comprising 25,000 acres have been purchased by the Standard Oil Company, and besides extending a pipe line to the Pennsylvania oil fields they are making extensive improvements, with the object, it is said, of refining Lima oil and sending it out in tank cars to distributing centers. It is denied that there is any intention of abandoning Pennsylvania, as reported.

The Illinois House has passed the bill providing for widening and deepening the Illinois and Michigan Canal to the dimensions of a ship canal from Chicago to its connection with the Illinois River, and the improvement of the latter to a corresponding degree to its connection with the Mississippi River. This enterprise, which so long has occupied the attention of Congress, is now looking in the right direction for patronage—to the State Legislature rather than to the general Government.

The Mayor of Baltimore says that city is growing faster than any other in the country, unless some of the mushroom towns in the West are excepted, and that the population numbers 500,000.

The bar at Atlantic City has been made impassible by recent storms.

Mayor Grant hastens to clear the streets of electric wires, availing himself of the authority conferred by law, as recently decided in the courts. The companies affected are now most concerned to save their property from seizure and find it necessary to move with speed. The streets from which poles have been removed appear to be much wider than before.

Shipments of arms from New York to Hayti continue.

The Lake Shore and Michigan Southern Company have ordered 25 new engines from the Schenectady Locomotive Works. Three of the number are heavy passenger engines, 15 Mogul freight engines, and the others are designed for switching purposes.

The failure of the Callender Insulating and Waterproofing Company, whose factory is at Harrison, N. J., involves several New York firms to some extent, but what percentage of loss will be shown in the settlement with creditors cannot be known at present. The plant is said to be mortgaged for \$100,000. Among the creditors Fuller Bros. are mentioned and others whose amounts are not so large.

Australian advices respecting the partial failure of the wheat crop indicate a total deficiency in New South Wales, Queensland and Tasmania of 8,750,000 bushels, while Victoria, South Australia and New Zealand have an available surplus of 9,500,000 bushels, or 75,000 bushels more than the deficiency of the other three

colonies. Considerable engagements have already been made for further shipments to Europe from New Zealand, Victoria and South Australia.

One of the most destructive fires in New York for many years occurred on Friday night, when all of the docks and buildings on the North River water front from 58th street to 70th street, together with freight-houses and two grain elevators belonging to the New York Central Railroad Company, were totally destroyed. The loss will amount to at least \$3,000,000.

The exportation of live cattle from New York has suddenly grown to large proportions, demanding all the available room on the outgoing freight steamers. The aggregate shipments from New York, Boston and Baltimore last week comprised 14,200 head, the largest in the history of the trade. Beef is much cheaper here and in better condition than usual, owing to the abundance of corn.

The Canadian Government has published a record of changes in transportation effected by the construction of the Intercolonial and Canadian Pacific railroads. According to this report, the traffic handled by United States lines for Canada (in intercolonial trade and foreign commerce) has declined to one-half the amount carried the year before the Intercolonial road was opened. In 1875 the railroad lines of the United States carried \$46,000,000 of Canadian merchandise between points in the Dominion and between Canada and our seaports. In 1888 this traffic dwindled to \$23,000,000.

The pernicious operation of the Yates prison bill becomes more evident every day in the experience of New York State. This year there is already a deficit of \$192,388.97 for the past six months, and there are more convicts confined than ever before, with the number increasing, due to the fact that the county judges, instead of sending prisoners to the penitentiaries, as they are no longer self-supporting, prefer to confine them in the prisons as a burden to the State. Within the past six months 37 convicts have been locked up in the Auburn Insane Asylum, an increase of 27 over the number for the same time last year.

Emigration to the United States has commenced in earnest this spring at various European ports. Four thousand, mainly Germans and Swedes, sailed from Liverpool in a single day. The movement is said to be more voluntary in character and less the work of agents than hitherto. The increase is due to the pressure of military duty and taxation.

The alleged electric sugar frauds hang fire in the courts. Ever since Mrs. Olive E. Friend was arrested as being one she has been confined in the Tombs, as she has been unable to procure a bondsman for \$7000. She still maintains that her husband really possessed the secret of refining raw sugar cheaply and quickly by means of electricity. Assistant District Attorney Davis, who is in charge of the case, has not as yet been able to prepare for trial, but he is very positive that the whole scheme was a swindle.

The Edgemoor Iron Company have taken the contract for an iron bridge across the Delaware, at Portland, Pa., to perfect the connection with the Poughkeepsie Bridge.

Port improvements at Buenos Ayres are so far advanced that steamships are no longer compelled to anchor far from the shore and lighter their cargoes to the city. The first section or basin was formally opened January 28. United States Consul Baker says there are three other basins of equal size with the one just opened in process of construction, connected by gates and with deep canals on each side,

all of them approached from the outer roads though the outer channels of the Riachuelo, and within two years it is expected that the entire port will be open to commerce.

The Interstate Commerce Commission decides that a rebate allowed by the Grand Trunk Railway of Canada in transporting coal and coke from Buffalo and other points in the United States to various points in Canada is illegal. The question at issue arose between the Michigan Central and the Grand Trunk, especially in regard to the movement of anthracite coal to various points in Canada. Both make large shipments into Canada. The latter company have seen fit, according to the statement of General Manager Hickson, "to make special rates to the principal points for large shipments." As the Michigan Central are not permitted by the Interstate act to do the same thing, and competition under such circumstances is disadvantageous to that company, they have appealed to the commission and have had a hearing, with the result mentioned above.

Further particulars respecting the loss of the steamship Danmark, obtained from her engineers, show that the disaster is primarily due to the bursting of a steam-pipe, or a breaking down of the engines, when the steamer was within 800 miles of the coast of Newfoundland. The engineer was killed on the spot and the ship was badly damaged. In consequence of this damage, together with the breaking of the shaft, the vessel was helpless in the heavy seas, making it necessary to abandon her. The steamship Missouri rescued the passengers and towed the Danmark two days, until April 6, when it was decided to leave the wreck and sail direct to the Azores.

Mrs. Maria St. John Sheffield, widow of Joseph Earl Sheffield, donor of the Sheffield Scientific School at New Haven, died in that city on Sunday night. In 1860 Mr. Sheffield gave to the scientific department of Yale the building now called South Sheffield Hall. By Mr. Sheffield's will the "homestead" was to go to the college after the death of Mrs. Sheffield. This property is now valued at \$250,000. Property on Chapel street, in which the school has an interest, will increase the amount to nearly \$600,000.

The value of the fisheries of Canada, which have been so much a subject of international dispute, decreased nearly \$1,000,000 during the year 1888, as shown by the official report, as follows:

Nova Scotia .....	\$7,817,080
New Brunswick .....	2,941,868
British Columbia .....	1,902,195
Quebec .....	1,860,012
Ontario .....	1,839,969
Prince Edward Island .....	876,862
Manitoba and Northwest Territories .....	180,877

Showing an aggregate of ..... \$17,418,510  
As against \$18,386,103 for the year 1887,  
or a decrease of \$967,592.

At the first general meeting of the subscribers to the Meigs Elevated Railway, held recently, the charter of the corporation was approved and it was decided to issue stock to the amount of \$200,000. From this it would appear that this scheme, which has languished long and which really embodies new methods of elevated railroad construction and operation, is about to assume a more tangible form.

An acid trust was organized at Middletown, N. Y., lately by 35 leading manufacturing concerns, with John Bayless as president. Pyroligneous acid and charcoal are the first products of the distillation of wood confined in sealed iron retorts and subjected to intense heat. The acid when subjected to a further process yields what are known as the wood alcohol, acetate of lime and naphtha of commerce. The

alcohol is the most valuable product, inasmuch as it affords a cheap substitute for grain or fruit alcohol in the arts and for mechanical and manufacturing uses. There are 60 acid factories in the wooded region comprised within the bounds of Sullivan, Delaware and Broome counties, New York, and Wayne and Susquehanna counties, Pennsylvania, and perhaps a dozen others in West Virginia, Kentucky and Tennessee. The value of the total annual output of the factories is estimated at \$2,500,000.

The Ericsson Coast Defense Company have filed their certificate of incorporation. The company's capital is \$250,000 and their object the manufacture and sale of boats, vessels, guns, machinery and other appliances. The incorporators are George H. Robinson, William Williams, Ericsson F. Bushnell, Cornelius S. Bushnell and Edward S. Innet.

Findlay, Ohio, and Tiffin also, on the natural gas belt, are astonished by the copious flow of gas from newly-drilled wells. A well struck last week is said to have a capacity of 30,000,000 and another 20,000,000 cubic feet of gas per day. At Tiffin the pressure of an old well increased suddenly, blowing out the casings of the well and bursting pipes in a factory which used the gas. This well has an estimated capacity of 28,000,000 feet per day.

According to the *Ironmonger* the three great telephone companies of England have, after protracted negotiations, agreed to amalgamate, subject to confirmation on the part of the shareholders. The total value of their properties is close upon 4,000,000 sterling, and the present total revenue £400,000. The amalgamated companies intend running telephone wires between all the great towns in England.

The *Leader*, of Pittsburgh, reports as follows respecting an experiment in copper welding recently made in that city: "James Burns, representing the Burns Copper Welding Company, took possession of an ordinary blacksmith forge, and with a rod of copper  $\frac{1}{2}$  inch in thickness began operations. After the flattening process usual in such work he formed a disconnected ring. The usual 'scarfing' process followed, then the operator, after sprinkling a powder over the piece, proceeded to make a weld which when cooled showed a perfect union. He then took the ring, measuring 2 inches in diameter, and submitted it to a strain until it had widened  $\frac{1}{2}$  inch. This demonstrated conclusively that the union of the two ends of the rod was not the mere 'brazing' known to mechanics to-day. Other experiments were made, and in every case the spectators expressed themselves as being satisfied that the process was a complete success. Some of those who watched the work have spent years in working among metals, and consequently were well justified to express an opinion in regard to the copper-welding process."

The final arguments in the case of Andrews Bros. & Co., of Youngstown, Ohio, vs. the Youngstown Coal and Coke Company, Limited, were heard in the United States Circuit Court at Pittsburgh last week. An interesting point is involved in this suit. Three years ago the Youngstown Coal and Coke Company agreed to furnish the plaintiffs coke at the rate of 95 cents per ton. Last November the price of coke went up and defendants refused to furnish any more at the price agreed upon. They claimed that the agreement made between the firms was illegal, having been entered into by but one member of the limited firm. The law provides that two members of a limited concern be parties to an agreement. Andrews Bros. & Co. bring action in equity for a new contract, there being no legal redress on the old one.

## MANUFACTURING.

### Iron and Steel.

On Tuesday, the 16th inst., the employees of the Allegheny Bessemer Steel Company, of Pittsburgh, whose works are located at Duquesne, Pa., went out on a strike, and at this writing every department of the extensive plant is idle. Several weeks ago the rail straighteners, drillers and telegraphers, about 45 men in all, struck for the same wages paid at the Edgar Thomson Steel Works. They were receiving \$2.50 per day. The firm offered to increase their wages to \$4.50 per day; but they would not return to work unless the firm would consent to discharge a man who had refused to stand with them in their demand for more money. This the firm refused to do, with the result that every man employed at the works at once stopped work. The company have made application to the Governor for the appointment of 25 coal and iron police officers. The men will be assigned to duty as soon as their commissions arrive, protecting the property of the company and their men.

One hundred coke ovens are being built by the Cameron Coal and Iron Company at Emporium, Pa. The company's blast furnace at that point is turning out 100 tons of pig metal a day.

Lean & Blair, engineers and contractors, of Pittsburgh, are erecting a 2-ton Lash open-hearth steel-melting furnace for the Johnson Company, of Johnstown, Pa.

The Penn Bridge Company, of Beaver Falls, Pa., manufacturers of bridges, roofs and structural ironwork, are operating their works to their fullest capacity, with sufficient orders on hand to keep them busy for two months to come.

The threatened strike of the furnacemen in the employ of the Crane Iron Company, at Catasauqua, Pa., on account of a reduction of wages, passed over without a cessation of labor, the employees concluding to accept the reduction. In consequence the fillers commenced re-filling on Saturday, the 13th inst., and Nos. 4, 5 and 6 furnaces are casting iron as usual. No. 8 was in need of repairs and allowed to go out. No. 1 is also undergoing repairs.

The annual meeting of the stockholders of the Birmingham Rolling Mill Company was recently held at Birmingham, Ala., and resulted in the selection of the following officers: G. W. Norton, president; W. B. Caldwell, vice-president; B. Du Pont, treasurer; John B. McFerren, W. W. Hite, W. P. Harvey, and J. G. Caldwell, all of Louisville, directors. "As the fiscal year of the company does not end until June, there were no formal reports, but the condition of the industry as shown to the stockholders was more than satisfactory."

The Standard Iron Company, of Bridgeport, Ohio, are erecting a large building for the purpose of taking care of their increased corrugating business, which has so grown that they were not able to handle it in their old buildings. With the new accommodations the new company will have a capacity for painting and corrugating 50 tons of sheets per day, probably the largest capacity of any concern in this line in the country.

The Columbia Rolling Mill Company, at Jersey City, N. J., are progressing with their improvements and extension. They have just completed the erection of four reverberatory furnaces, a smelter, and the putting in of a 10-ton coal scale, and are sending out proposals for two 100 horse-power boilers, a 150 horse-power engine and the necessary machinery for running

four pairs of rolls, which when completed will greatly facilitate and increase their capacity for production.

Spearman, Collord & Co., of Sharon, Pa., who have been operating the Sharon Furnace, at that place, under lease for some months, have declined to purchase it at the option they have held on it for some time. Their present lease expires on July 1 next. The furnace is owned by Boyce, Rawle & Co., of Sharon, Pa.

The blast furnace, engines and other property of the old Duluth Iron Company were sold on the 6th inst. to satisfy a mortgage judgment of \$130,000. In 1888 Walter Mann, of St. Paul, the trustee of the property, purchased 100 \$1000 shares of stock, and when the company stopped business a mortgage and trust deed was executed to him to make good his interest in the concern. There were no bidders for the property besides Mr. Mann.

The large new plate mill recently erected by the National Tube Works Company, of McKeesport, Pa., was put in operation last week.

During the month of March last the two stacks of the Isabella Furnace Company, at Etna, Pa., produced 11,194 gross tons of foundry pig iron.

The nail factory of P. L. Kimberly & Co., Limited, at Sharon, Pa., containing 40 nail machines, is in full operation making both iron and steel nails. We are informed that the report that this firm were making a combination iron and steel nail is without foundation.

C. Burkhart & Co., proprietors of the Falling Spring Charcoal Furnace, at Chambersburg, Pa., which has been idle for some time, have leased the furnace for one year to Burkhart & Co., who expect to put the furnace in blast some time in July next. It will produce cold-blast charcoal iron and is expected to turn out about 15 tons per day.

Mont Alto Furnace, of the Mont Alto Iron Company, at Mont Alto, Pa., was put in blast on the 8d inst., after being thoroughly repaired and relined. It is expected to turn out about 30 tons per day of hot-blast charcoal iron.

On the afternoon of the 11th inst. the American Tube and Iron Company, of Middletown, Pa., received a cable message from Russia ordering 30,000 pounds of casing to be sent to a particular point in the Russian oil territory as soon as possible. The general superintendent of the company, Mr. A. S. Matheson, at once made preparations to fill the order at the earliest possible moment. When the cablegram was received the iron for the tubing was in the rough at the rolling mill in York, and it was at once forwarded to Middletown. The rolls that make the pipe were speedily changed, the millmen set to work with a will, and so successful were the efforts of the superintendent that the pipe was delivered at the ship's side on the night of the 12th inst., and on Saturday morning in the vessel *en route* to Russia. The above company have also recently received an order from the Citizens' Natural Gas Company, of Lafayette, Ind., for 27 miles of 8-inch pipe, and will also furnish 20 miles of standard 8-inch pipe of superior requirements to the National Transit Company for their oil line to Cleveland, Ohio. The company have contracted under forfeit to ship these parties an aggregate of over a mile of pipe per day.

We are informed that the report that J. Morgan Coleman, of Youngstown, Ohio, had commenced the erection of a rolling mill at New Birmingham, Tex., is without foundation.

Ella Furnace, at West Middlesex, Pa., operated under lease by the Wheeler Furnace Company, of Sharon, will be blown out at an early date for extensive repairs.

The plant of the Warren Tube Company, at Warren, Ohio, which originally cost about \$150,000, was sold at sheriff's sale on Saturday, the 13th inst., to O. C. Barber, of Akron, Ohio, for \$35,000. It is reported that Mr. Barber represented the majority of the original stockholders, and the works are now practically in the hands of the builders. It is also stated that the plant will be put in operation at an early date.

Hecla Furnace, of the Hecla Iron and Mining Company, at Ironton, Ohio, is being extensively repaired and will be ready to resume blast in a few days.

About one month ago the hot-bed men, the telegraphers and furnacemen at the Edgar Thomson Steel Works of Carnegie Brothers & Co., Limited, at Braddock, Pa., received notice that they would get an increase in wages, the same to be paid by a percentage on all rails produced over 1200 a day. At that time the engineers, hot and cold saw men and water-tenders asked for a similar advance, but were refused. At the last pay the advance was voluntarily granted. The roll hands were given a like increase.

The new rod mill now in course of erection by the New Castle Wire Nail Company, at New Castle, Pa., will have a capacity of about 150 tons of nail wire per day and will employ 200 men. The company will use about 100 tons of this product per day and will dispose of the rest.

The ore property formerly owned and operated by the Pittsfield Iron and Steel Company, of Pittsfield, near Rutland, Vt., including concentrator, Catalan forge and machinery, is offered for sale by U. K. Flagler, Boston, Mass.

The works of the Trinidad Rolling Mill Company, at Trinidad, Col., have begun operations. The works have a daily capacity of 25 tons of merchant iron. The machinery consists of a battery of four 125 horse-power boilers, feed-water heater and steam boiler and supply pumps, one 500 horse-power engine, operating an 18-inch bar train complete, a 300 horse-power engine with 12-inch roll train, two heating furnaces, large and small shears (with independent upright engines), cold saw, lathes, cranes and all other necessary appurtenances, the machinery having been made by the Lewis Foundry and Machine Company, of Pittsburgh. The product will consist of square, flat, round, half-round, diamond and mine T-rails. In this connection the New Mexican Iron Company make a proposition to Trinidad for the location of an iron blast furnace at that point.

The National Forge and Iron Company, of Chicago, have made arrangements to build their works at East Chicago, Ind., where they have secured a tract of 12 acres, with excellent facilities for rail and water transportation. The proposed location at Burnside was abandoned because of conflicting claims over the ownership of the land. The site now secured is in the immediate vicinity of the works of the Chicago Horseshoe Company and the car-wheel works of C. A. Treat, both of which are nearing completion. The machinery for the forge company is all under contract, and the erection of their buildings will be actively pushed in order to receive it as soon as it is ready to put in place.

The *Mining and Scientific Press* is authority for the statement that the Puget Sound Iron Works, at Irondale, Wash., will increase their capital stock, which is now \$1,000,000, with the view of

erecting rolling mills, to engage in the manufacture of steel and wrought iron in connection with their output of pig iron.

#### Machinery.

The Westinghouse Electric Company, of Pittsburgh, have received an order for 3000 incandescent electric lamps for a central station plant at St. Joseph, Mo.

The stockholders of the Arms, Bell & Co. Nut and Bolt Works, at Youngstown, Ohio, destroyed by fire two weeks ago, have decided to rebuild as soon as their insurance is adjusted. An entire new line of the most improved machinery will be placed in the plant, the intention being to make it a model concern.

The Ottumwa (Iowa) Iron Works, manufacturers of coal-mining machinery, have just issued a catalogue from which a good idea can be formed of the various machines made by them. Their catalogue shows their first and second motion hoisters, their tail-rope and endless-rope engines, pumps, ventilating fans, elevators and cages, coal cars, pulleys and shafting, presses, rolls and grinders, pipe and fittings, &c. The catalogue also describes the Ramsay coal distributor, which is made by the Ottumwa Works.

The new illustrated catalogue of the Rand Drill Company, of this city, contains, in addition to descriptions and engravings showing the various machines they manufacture, much interesting and valuable information relating to mechanics. The catalogue is divided into four parts, the first of which treats of drills and mountings, air compressors, boilers, air receivers, pumps and supplies, pipe and fittings. The second book, bearing the title "Useful Information," deals with compressed air, steam, transmission of power and miscellaneous matters. The third book is entitled "Work Done," and illustrates mining, quarry, tunnel and sub-marine work. The last book contains comparisons and tests. The engravings are fine specimens of work, and were so selected as to well illustrate the various products of the company. Much of the "Useful Information" is original, and will certainly prove "useful" to those studying the subjects treated.

The Buckeye Engine Company, of Salem, Ohio, have just published three catalogues, bound separately. The first describes and illustrates all the parts of the engines made by this company, so that an accurate conception can be formed of their construction and operation. The second presents a few admirable wood-cuts of different types of engines, after which follows an instructive description of the use and management of the indicator and useful data on steam and steam-power plants. The matter bears evidence of careful preparation, and will be found of value by those interested in steam. The third part is a list, covering some 36 pages of type, giving the names and addresses of those who have used the Buckeye automatic cut-off engine since its first introduction in 1874. In the introduction we find the following statement: "We hope the intending purchaser who is not familiar with the merits of the engine will refer directly to any of the addresses given, and we are ready to accept an intelligent judgment of that portion of the record which he may get."

The Topeka Rapid Transit Railway, the equipment of which has just been finished by the Thomson-Houston Electric Company, was put in operation on the 3d, the trial trip, made with four cars filled with invited guests, being most successful in every way. This road is the largest in the world (14 miles, 20 miles of track) and is probably the finest electric railway in the West. The power station is located at the corner of Jefferson and Second

streets. It is a two-story building, 100 feet front and 85 feet deep, and has a 125-foot chimney. The power plant consists of two Corliss engines of 600 and 800 horse-power, respectively, steam for which is supplied by five boilers, 6 x 16 feet. The electrical apparatus consists of six 30 horse-power Thomson-Houston generators, with switchboard and all necessary appliances for the same.

The Jeffrey Mfg. Company, of Columbus, Ohio, were the pioneers in this country of coal-mining machinery, and their productions are well and widely known. They have not confined their attention to mining machines alone, but have obtained control of valuable patents for chain belting, which is extensively used for elevators, conveyors and driving belts for handling grain, coal, ores, &c; they also control the manufacture of the Slater bolting reel, the Gregory grain drier and the Wilson spring whiffletree. Their new works consist of five departments—the foundry, machine shop, blacksmith and wood-working shop. The cutter works is equipped throughout with improved machinery especially adapted to the work.

On and after May 1 the Prentiss Tool and Supply Company, now located at 42 Dey street, will be the New York agents for the Putnam Machine Company, of Fitchburg, Mass., and will remove their offices to 115 Liberty street, where a full line of the many excellent tools made by the Putnam Company will be kept on hand.

#### Hardware.

The Erie Specialty Mfg. Company, Erie, Pa., have been organized for the manufacture of hardware specialties, including cork-pullers, lemon-squeezers, ice-shaves, milk-shakes, cigar-cutters &c., most of which have been invented by E. Walker, who is manager of the company.

Johnson & Colton, Montpelier, Vt., manufacturers of saddlery hardware, have recently moved to new quarters in a building 100 x 35 feet and four stories high. The change was made necessary by the enlargement of the business, which was established a number of years ago and has been growing steadily ever since.

The firm heretofore known as W. R. Baker & Sons, Watertown, N. Y., has been incorporated as the W. R. Baker Mfg. Company. They will continue making special and boat hardware, and with additional capital will increase their manufacturing facilities and enlarge their plant. Their foundry facilities especially will be greatly increased, and they will hereafter be able to furnish brass and bronze castings for all purposes. W. R. Baker, the president, will, as heretofore, have charge of the mechanical department; W. W. Sherman, the treasurer of the company, will manage the general office affairs; and Pitt J. Baker, secretary, will take charge of the general selling and advertising of the concern.

The business of the Withington & Cooley Mfg. Company, Jackson, Mich., is increasing so rapidly that additional room is needed, and they are now having the plans drawn for a large building to be erected just north of their office and warehouse. The exact dimensions of the building are not yet announced, but it is stated that it will contain about 25,000 square feet of working room. It will be of brick, two stories in height, with a basement. When completed it will be used as their wood-working department, the work of putting handles on the tools being done there. This will give employment to about 50 men in addition to their present force. The company, we are advised, have recently been obliged to refuse an order for 14,000 dozen Forks from France because they had not the facilities to fill

it. The company are investigating the merits of crude petroleum as a fuel. Three new boilers are also being put in.

#### Miscellaneous.

A press dispatch from Akron, Ohio, under date of the 19th inst., says: "A meeting of Akron capitalists who had subscribed \$25,000 among themselves and Messrs. Loomis and Loyd, of the Loomis Fuel Gas Company, was held in this city to-day and arrangements made for the incorporation of a company with \$100,000 capital to build a fuel gas plant in Akron immediately."

The largest compressed-air establishment in the world is at Paris. It has a plant with 5000 horse-power. Begun in 1881 to distribute the power necessary for the driving of pneumatic clocks, it was not long before it was discovered that the air could be profitably used for two other purposes—to distribute motive-power to manufacturers by day and to produce electricity for lighting by night. The works, which are on the heights of Belleville, on the edge of the city, now occupy an area of 107,500 square feet, or 2½ acres, two-fifths of which is covered with buildings.

A new company has been formed in Norristown, Pa., for the manufacture of steam heating boilers, &c., under the name of Schimpf & Keim Boiler and Mfg. Company. Thomas G. Lovegrove, of Philadelphia, president.

The Lehigh Zinc and Iron Company, of Bethlehem, Pa., have purchased the Joplin Zinc and Smelting Works and 2140 acres of mining lands within a few miles of Joplin, Mo. A greater portion of the territory has already been developed and is ore producing. The aggregate price of the various properties is reported to have been about \$175,000. The company will at once enlarge the zinc smelting works and add a plant for manufacturing sheet zinc. To this enterprise the citizens contributed \$10,000, the company later agreeing that the plant shall have a capacity of producing 20,000 pounds of manufactured zinc a day, and to cost not less than \$250,000.

The Wetmore Canning Factory have just been organized at Wetmore, Nemaha County, Kan., and are making arrangements for the prosecution of their business. Their capital stock is stated to be \$10,000.

Among corporations recently authorized by the State of Illinois are the following: Northwestern Horse-Nail Mfg. Company, Chicago; capital, \$250,000; to manufacture horseshoe nails and other metallic products; incorporators, Russell Jones, John R. Corwith, Charles Fargo. The Murphy Car-Door Company, at East St. Louis; capital stock, \$50,000; for the manufacture of freight-car door fasteners; incorporators, P. H. Murphy, W. S. Wilson, D. Kennedy and F. W. Smith. The Page Woven Wire Fence Company, at Chicago; capital stock, \$40,000; for the manufacture of wire fence and machinery for manufacturing the same; incorporators, N. L. Clement, Austin Clement and Edward B. Bacon. The Lone Star Iron Company, at Chicago; capital stock, \$1,000,000; for mining, smelting and manufacturing iron products; incorporators, John A. Kruse, P. J. Howard and E. P. Atfield. The Osborne Steam Heating Company, at Chicago; capital stock, \$20,000; to manufacture and operate appliances for heating, power, lighting and other purposes; incorporators, Jesse Cox, Gideon F. Lanaghan and Eugene F. Osburne. A certificate was filed to record the increase of the capital stock of the Griffin Wheel and Foundry Company, of Chicago, from \$100,000 to \$150,000.

# The Iron Age

New York, Thursday, April 25, 1889.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.  
CHAS. KIRCHHOFF, JR., - EDITOR.  
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.  
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.  
JOHN S. KING, - - - BUSINESS MANAGER.

## A Western View of the Pittsburgh Freight Question.

The Chicago iron and steel manufacturers are naturally very much interested in the agitation of freight tariffs by the Pittsburgh manufacturers. The former understand the situation very thoroughly, having themselves been handicapped at times in the past by freight rates which operated to their disadvantage and consequently benefited their trade competitors. A man familiar with the course of the iron trade for but a few years can recall instances of this kind. Chicago was then at the mercy of the older iron centers of the East whenever prices of finished products were very much depressed. Raw materials were always dearer and wages were higher, while the railroads had a system of rebates which gave the Eastern manufacturer an advantage that could not be accurately measured, because it was usually shrouded in secrecy. The growth of Western manufacturing establishments was, under such circumstances, the creation of periods of activity when Eastern works could not supply the demand. It is not singular that Eastern manufacturers hope to keep up the old order of things and believe that they should still control the markets of the West. The discrimination of the coke-carrying railroads in favor of Chicago is regarded as the one impediment in their way, and they insist upon its removal. The Ohio manufacturers of pig iron also find themselves handicapped by the high freight rate to Chicago on their product, and they are seeking to have it reduced to the figures of former depressed times, so that they can again, as they believe, reach the Chicago consumer. On all sides the railroads are attacked as the chief offenders in keeping Eastern products from getting their share of Chicago business.

Now, the Chicago manufacturers do not see matters in the same light. Remarkable changes have occurred in the recent history of the iron trade, and they have inured steadily to the benefit of the men who risked their fortunes on the southern shores of Lake Michigan. Raw material has been greatly reduced in cost, labor is much more abundant and wages are not so extravagantly high as they once were, capital can be had without the enforced payment of usurious rates of interest, and the new Interstate Commerce act at least puts all competitors on an equal footing in requiring open rates to be made. The Northwest has at last become a practical manufacturing district, able to operate independently, and it moves forward in dull times, instead of only marching in company with the older sections of the country whenever the bugle of prosperity sounds an advance.

According to our Western friends, the war upon the high freight rates which now

disturb the serenity of the once imperturbable Pittsburgh community is not attacking the root of the difficulty. The increased cost of manufacturing iron and steel due to the excess charged over what is claimed to be a just rate will not restore to the East its former supremacy in Western markets if the reductions asked are granted by the railroad authorities. The Western manufacturers will endeavor to meet the new conditions of trade, and their progress in the recent past appears to give them a confidence in the future which they at one time did not possess. The struggle between the East and the West has begun on a more favorable footing to the latter, and it would not be surprising to see concessions made by the former which were wholly unanticipated but a few years since.

Our sympathies in this matter are with both sections. The real trouble arises from the dullness of trade, which prevents even the leading establishments of any part of the country from securing orders sufficient to keep them running at a profitable rate. Until business revives this general feeling of dissatisfaction and restiveness will continue, and all items of cost and charges will be attacked in the hope that they can be scaled down. The freight rates now charged were not deemed high until competition began to pinch the manufacturers in quarters in which they had previously had little trouble in getting business. It would be idle to counsel patience to men under such circumstances. Impatience will not hasten the return of prosperity a month or a day or an hour. The chief cause of trouble in the iron trade to-day is the limited demand from the railroads, whose net earnings are too small to enable them to buy what they really need.

Emphasis is given to the statement recently made in *The Iron Age* that the prosperity of iron and steel makers abroad, in spite of small orders from this market, is due to the larger business in other quarters, by the figures lately published in England and Germany. William Fallows & Co., of Liverpool, estimate that home consumption of pig iron in 1888 was 4,133,016 gross tons, as compared with 3,170,160 tons in 1887, 3,842,221 tons in 1886 and 3,626,192 tons in 1885. In other words, English consumption jumped nearly a million tons. This is partly due, of course, to a better demand for machinery for export, the Board of Trade returns showing £9,745,685 in 1888, as compared with £8,330,971 in 1887 and £7,124,270 in 1886. The greatest progress in any one industry has been in ship-building, the tonnage completed in 1888 having been over 900,000 tons, while at the beginning of the current year the new shipping laid down or contracted for reached the enormous amount of about 1,250,000 tons. It is necessary to state, however, that this has begun to tell on rates of freight throughout the world, a decline having set in during the past month. Germany, too, has experienced a revival which explains the indifference of its manufacturers to American orders. Statistics recently published show that the consumption of pig iron in Germany increased from 3,798,459 metric tons in 1887 to 4,231,199 tons in 1888. It is certainly not surprising that with nearly 1,000,000 tons added to

the consumption in England and 500,000 to that of Germany the European makers can see the American demand reduced to a minimum without feeling its absence keenly.

## The Report of the American Iron and Steel Association.

The statistics of the production of all forms of iron and steel in the United States in 1888 will be found in very compact shape in the annual report which has just been issued by James M. Swank, general manager of the American Iron and Steel Association. This report has been printed earlier in the year than any of its predecessors, and thus comes more closely to realizing the full value of statistics of the character treated in its pages. In this respect no statistical office in the world, particularly those operating under the direction or patronage of the various governments, has as good a record. The fullness of detail which has always characterized the association's reports is a conspicuous feature of this latest addition to their publications. The leading products of the iron and steel industries of the country are shown to have been as follows in the past calendar year as compared with the preceding year, using gross tons, which the trade generally employs:

	1888. Tons.	1887. Tons.
Pig iron.....	6,496,738	6,417,148
Bessemer-steel ingots.....	2,511,161	2,936,033
Open-hearth steel ingots.....	814,318	332,069
Cast-iron steel ingots.....	70,279	75,378
All forms rolled iron.....	2,153,263	2,311,161
All forms rolled steel.....	2,464,087	2,944,545

Included in the totals of the above table are the following products, which are given separately to avoid duplication and perplexity, also using gross tons:

	1888. Tons.	1887. Tons.
Bessemer-steel rails.....	1,386,277	2,101,904
Iron rails.....	12,725	20,501
O. H. steel rails.....	4,697	17,145
Iron bars and shapes.....	1,624,029	1,711,967
Steel bars and shapes.....	699,301	472,312

Steel cut nails.....	198,012	155,772
Wire nails.....	66,964	55,804

\* Excluding nail plate.

From these tables it will be seen that the production of 1888 corresponded very closely with that of 1887 in almost every line, in some cases making a decided gain, as in pig iron, steel bars and shapes, steel plates and sheets, steel cut nails and wire nails. The only falling off of consequence was first in Bessemer steel rails, accompanied by a natural decrease in the production of Bessemer steel ingots, and second in iron cut nails, which seem to be very rapidly going out of use. Apart from these two special interests, therefore, the year 1888 afforded a fairly good demand for iron and steel products.

For the first time the wire-rod production of the country has been ascertained. It appears that in 1888 the production of iron wire rods was 13,010 gross tons; of steel wire rods, 266,759 tons; total, 279,769 tons. The growing importance of this industry, however, would seem to entitle it to more space in the report than the brief paragraph in which these statistics are recorded. This is the more noticeable also from the fact that this business is now passing into the control of domestic manufacturers, and that we have nearly seen the last of heavy importations of rods. Rolling mills are now being erected in several parts of the country to manufact-

ure wire rods exclusively, so that the prospects are bright for a great increase in production this year over last year. And more mills of the kind are projected. What was once almost a lifeless industry is rapidly climbing its way to prominence.

But we did not start out to criticise this report, and have no intention to detract from its obvious merits in the least. We would like to make a suggestion, however, relative to tables of prices of iron and steel products. Philadelphia and Pittsburgh are time-honored centers of consumption of iron and steel, and should have a place in tables of prices. But the country has changed marvelously in late years, and other centers of iron production and commercial activity in iron have attained prominence. Cincinnati, Louisville, Birmingham, Cleveland, Chicago and St. Louis are iron centers whose prices move in slightly different orbits from those of Philadelphia and Pittsburgh. Their prices should also be preserved from year to year. The changes which have occurred merely in the past five years would form a very interesting study to many an iron manufacturer who has found his old markets slipping away from him. We would also like to make another suggestion, which occurs to us after reading the "General Review of the Domestic Iron Trade in 1888." The course of the demand for steel rails is no longer the key to the whole situation, although that was the case for years. During the last half of 1888 the market cut loose from the depressing influence of the poor business done in steel rails, and from the middle of July to nearly the middle of October a most excellent demand was experienced for pig iron, bar iron and a great many other iron as well as steel products, and prices were forced to a somewhat higher level. A study of steel-rail prices does not show this, of course, but a study of other prices would. Barring steel rails, the year 1888 was quite a good year for American manufacturers of iron and steel, some of whom even felt encouraged in September and October to advance their workmen's wages. We have no doubt that they would be very glad to have a continuance of the average of the first ten months. It may be strictly true that, as the report states, "the producers of Lake Superior and other domestic iron ores were more prosperous in 1888 than those who purchased their ores," but we would like to hear the evidence on both sides of this subject. The ore producers seem to be very positive that in 1888 they were the sufferers.

Hard on the heels of the estimates of the *Chicago Railway Age*, which were received very skeptically, come statistics compiled by the *Railroad Gazette* bearing on current railroad building. Our new contemporary makes the mileage of new track laid during the first quarter of the year 474 miles, against about 1000 miles in the corresponding period of 1888. This would indicate a total mileage of 3500 miles for 1889, against 7000 miles last year, if the same ratio be maintained. The *Railroad Gazette*, however, maintains that it is quite impossible to predict how much of the work now under way, aggregating 4221 miles in the United States, Canada and Mexico, will be carried forward during 1889. It is possible that it may be actively rushed, or that it may progress

very slowly. That will be determined by the success which projectors may have in perfecting their financial arrangements. A few weeks may change the situation in the money centers, and where hesitation and distrust now reign supreme eagerness and confidence may prevail. Thus far the outlook is certainly not promising.

#### Late Developments in the Russian Petroleum Regions.

Although Russian petroleum has not yet become a very formidable competitor of ours, it is good to watch what is going on in the Caucasus, this industry being pushed with great vigor and certainly giving astonishing results in many ways. Considerable discussion has been going on in Russia as to the advisability of laying a pipe line from Baku to the Black Sea, but although the capital for it has been in readiness for some time past, the Russian Cabinet is for the present at least opposed to the project, especially the Ministry of Communications. A considerable portion of the petroleum finds its way into the interior of Russia by ascending the river Volga; if, therefore, a pipe line should convey it almost exclusively to the Black Sea, the Government apprehend serious difficulties, most of the steamboats on that river, the factories on its banks and the railroads traversing the regions using naphtha as a fuel. The Government even intends to go further, and is making arrangements to have the residue utilized by the railroads subsidized by the State, hoping that they will then be run cheaper and that the saving will amount to millions of rubles. Besides, a fleet of steamers and lighters has been built for the conveyance of naphtha not only on the Volga, but on the Caspian Sea, and it would be ruinous for them if suddenly a pipe line were to take the bulk to the Black Sea. The latter region, moreover, is by no means dependent on that kind of fuel alone, inasmuch as it has within easy reach both Russian and Caucasian coal, and can import foreign without difficulty. A pipe line would be injurious besides to the interests of the Transcaucasian Railway—now conveying the petroleum—and the Government takes a special interest in seeing the same prosper. It even contemplates buying it. If the pipe line were laid now, at a time when the productiveness of the Caucasian oil region is not yet fully developed, Russian petroleum would soon be cheaper in Central and Western Europe than in the interior, while in the provinces watered by the Volga an insufficient supply of a cheap fuel would again lead to the destruction of forests, the very thing the men in power want to prevent.

Those taking a different view of the matter are of the opinion that the present owners of the Transcaucasian Railway or the Government, should it buy the line, can easily place the same in a position to defy any pipe line or lines. The number of tank-cars would have to be increased, the line be double-tracked, and this would coincide with the finishing of the Suram tunnel. They assert that the present freight rate of 16 copecks per pood could then be reduced to 10 copecks and yet leave a good margin, whereas the pipe applications for a concession are based on 11 copecks per pood. At 16 copecks the

railroad forwarded last year 32,000,000 poods of naphtha products, the pood equaling 36½ pounds American. As at the same time both the Persian and Central Asiatic trades are expanding—it is believed the Transcaucasian Railway will soon transport a good deal of merchandise in transit in that direction—the question arises whether Baku is in position to procure petroleum enough both for a double-track railroad and a pipe line, the more so as another railway line is projected—the Baku-Petrowsk-Rostow—which will also convey petroleum. Those who believe that sooner or later a pipe line will be laid in spite of the present Government opposition, the latter no doubt soon modifying its views in this respect, insist that production, not fully developed now, will soon become so exuberant that means will have to be found to get all the oil out of the way. Now, the pipe line would convey crude, and at its terminus on the Black Sea refineries would be erected. They seem to feel convinced that there will be oil enough to feed both the railroads named and one or two pipe lines. At any rate, the Government looks upon a pipe line as premature at present. In a couple of years those advocating it may nevertheless see their hopes fulfilled, and in some shape or another Russian oil may then be made to compete with ours in Europe.

We have reason to believe that work upon the Hudson River Tunnel will now be carried forward until it has been completed or else permanently abandoned. The rumors which have been circulated in the papers during the past few weeks concerning the raising of capital—\$1,500,000—in England to prosecute the work appear to be founded upon fact. We are not yet informed whether the plans formerly pursued will be adopted in the new work or not, but it is probable that operations will be prosecuted under the control of English engineers. The distance between the New York caisson and the Jersey City shaft is 5600 feet. The north tunnel has been finished about 1900 feet from the western shore and about 200 feet from the eastern shore, leaving a distance of 8500 feet yet to be completed before the headings of this tunnel meet. The south tunnel has been completed about 550 feet from the west and 50 feet from the east shore, leaving a length in that case of 5000 feet. No attempt has yet been made to provide terminal facilities at either end, the object all along being to first complete the submarine portion of the work and afterward lead the tunnel to an outlet in New York at the most desirable point. Land damages and traffic facilities, of course, will govern the selection to a great degree.

**Southern Freights.**—The Southern Railway and Steamship Association have issued a circular, under date of the 19th inst., announcing that on the 1st of May the rates of freight will be based on \$2.75 from Birmingham, \$2.25 from Chattanooga and \$2.50 from Sheffield to Cincinnati, \$2.50, \$2.25 and \$2.25 respectively to Louisville, and \$4, \$3.75 and \$3.75 respectively to Chicago. On the same date a special tariff on manufactured iron was sent out making the rates to Chicago 24 cents per 100 pounds from Birmingham and 22 cents from Chattanooga, 12 and 10 cents respectively to Cincinnati, 14 and 13 cents to St. Louis, and 11 and 10 cents respectively to Louisville, Ky.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., April 23, 1889.

The action of the appraiser at Philadelphia in classifying worsted cloths at the lower rate of duty, with woolen cloths at a higher rate, is the beginning of a policy of rigid construction on the basis of high duties by the Secretary of the Treasury. Under the rules of the Department it is customary for the appraiser simply to place his appraisal upon imported articles and refer it to the collector. The collector, however, is not compelled to accept the appraisal, but can go on collecting the duties the same as before. The collector at Philadelphia does not agree to the appraisal in this case, and is therefore disposed to collect the duty as heretofore, at lower rates. The appraiser was summoned to Washington yesterday, and explained the situation to the Treasury authorities. He was directed to return to Philadelphia and insist upon the collector forwarding the appraisal, so that the Department officers might have the question before them for a decision. Should the collector decline to forward the papers his removal will follow in a few days, as a Republican has already been selected for his place. It is probable that the collector will decline to comply with this exceptional proceeding.

There are several items in the iron schedule which have for some time been entered under a purely technical or forced construction of the law, which enables these articles to pass the Custom-House at a lower rate of duty. Not only will this be stopped and classification be made under a more rigid construction of the customs laws, but a general inquiry will be made respecting the assessment of duties on a number of imports of iron and steel, to see that the law is not evaded. The articles shall pay full duties and the American markets be protected thereby. It is evident that the Department is disposed to break up the system of technical construction of schedules and undervaluation as a means of facilitating foreign articles getting into the American markets.

The Secretary of the Treasury appreciates the fact that this Administration came into power on the sole issue of protection, and if there be any merit in high classification he proposes to take advantage of it and give the American markets full opportunity to reap the benefits.

The Treasury authorities have commenced to get the material together preparatory to the submission of certain tariff condumrums to the collectors of ports for investigation and reply. The Senate tariff bill, which is supposed to represent the most advanced ground of Republican ideas on this subject, contained certain defects which were to be corrected by the Senate. They will now be given trial in actual practice.

The controversy into which Senators Sherman and Quay have fallen over a question of patronage will prove a source of embarrassment to Representative McKinley, who was one of the prominent candidates for the speakership. The Pennsylvanians who have been circumvented by the Ohioans are now declaring that the 21 Republican votes of the delegation will be thrown solidly for Reed or for some Western candidate other than McKinley. The probability is that when the voting begins in caucus Representative Burrows will come up stronger than any of his rivals.

The correspondence received here from various parts of the country indicates that the prospects of large appropriations for additional vessels of the navy will greatly stimulate the iron and steel industry. It is claimed that an expenditure of \$10,000,000 a year in naval construction and

coast defense, which will create a large consumption of both iron and steel, will about cover the gap which usually lies between active markets and good prices and the unsatisfactory conditions of overstocked markets.

Secretary Tracy is giving attention to the study of naval construction. By the time Congress reassembles he will have before the President a comprehensive plan which will insure large and active Government purchases in the iron and steel market.

### American Society of Mechanical Engineers.

The Erie meeting of this society will be held Tuesday to Friday, May 14 to 17, inclusive. The selection of this place of meeting is a happy one, being in the center of a country teeming with appliances of interest to the mechanical engineer, and the study of which cannot but result most beneficially. The programme of the meeting contains topics of live interest, and is as follows:

First session, Tuesday evening, May 14, address by ex-President Horace See, followed by social reunion.

Wednesday morning session: Reports of council, tellers, committees and general business and professional papers as follows: Thos. S. Crane, "The Piping of Steel Ingots;" Henry R. Towne, "Gain Sharing;" Chas. H. Manning, "Comparative Cost of Steam and Water;" D. W. Robb, "The Old Locomotive 'Sampson';" James W. See, "Standards." At the evening session the following papers will be presented: Samuel Webber, "Notes on the Comparative Loss by Friction in a Transmitting Dynamometer under Different Loads and Speeds;" J. Burkhitt Webb, "Note on the Steam Turbine" and "An Error in the Encyclopædia Britannica;" Jas. E. Denton and D. S. Jacobus, "Steam Consumption by Engines at Various Speeds;" Jas. E. Denton, "Performance of a 35-ton Ice Machine."

On Thursday morning the following papers will be read: De Volson Wood: "Expansion of Timber due to Absorption of Water;" "Some Properties of Ammonia;" "Formulas for Saturated and Superheated Vapors," and "Some Properties of Vapor and Vapor-Engines;" A. F. Nagle: "Cornish or Double-beat Pump Valves;" A. W. Jacobi: "Improved Motion Device for Engine Indicators;" F. W. Dean: "Distribution of Steam in the Strong Locomotive" (supplement); Jay M. Whitam: "Cylinder Ratios in Triple Expansion Engines." The evening session will be given up to the following subjects: Scott A. Smith: "Belt Traction on Pulley Faces;" John H. Cooper: "On the Longitudinal Riveted Joints of Steam-Boiler Shells;" Lewis F. Lyne: "Bits of Engine-Room Experience," and "Kerosene Oil in Steam Boilers" (supplement).

Invitations have been extended to the society, through the local Committee of Arrangements, to visit the following places of interest: Stearns Mfg. Company Machine Shop, Erie City Iron Works, Jarecki Mfg. Company, Skinner Engine Company, H. F. Watson Paper Mill, Pumping Station of Water Works, Weschler's malt-house, Cleveland & Hardwicke Machine Shop, Ball Engine Company, and T. M. Nagle's machine shop. It is also intended to have a sailing party upon Presque Isle Bay and Lake Erie, at which time a visit to the pumping station and stand-pipe of the Erie Water Works will be made, and an exhibition drill will be witnessed at the Life Saving Station on Presque Isle.

Topical discussions, which have added so much to the interest of recent sessions of this society, will be continued at the coming meeting. The questions to be discussed are as follows:

What form of self-oiling boxes have you found the best for line and countershafting? Can you give figures as to economy of oil as compared with other methods?

What form of oil-cup or lubricator do you find most economical for use on machines requiring constant lubrication?

Have you any experience as to the use of machines for hand or power for facilitating foundry molding? Can unskilled labor be employed?

Is it right or wrong in theory to put a central support under the bed of engines of the Corliss type? Do you know of any bad results from its use or from its absence?

Does it prevent nuts from working loose or prevent breakage of bolts to reduce their cross-section between the head and the nut?

Did you ever meet with either of these cases? Did the unequal wear when a long slide works in short guides amount to enough to become objectionable? Did the unequal wear of a short piece working in long guides amount to enough to become objectionable?

Have you tried the plan of applying electro-motors to mechanical operations requiring not more than ten horse-power? Can you compare their convenience and economy with those of small engines or the usual transmissions by belting and shafting?

Is there any better plan to protect steel from corrosion than to japan it?

Have you successfully soldered aluminium? Can a luminium be welded by electricity?

Have you any experience in hardening machinery steel or in case-hardening it?

What are the relative advantages of the time-card and the time-book systems for keeping time in factories?

The usual arrangements have been made by the society for special rates for railroad fare to and from the convention. Full particulars will be furnished by F. R. Hutton, secretary, 64 Madison avenue, New York.

**The Connellsville Coke Trade.**—Advices from Pittsburgh are to the effect that the condition of the coke trade is steadily growing worse, the number of idle ovens now aggregating nearly one-fourth of the total number in the Connellsville region. Continued overproduction has resulted in a cutting of rates, with the result that sales have been made within the last few days at \$1 per ton, and it is hinted that bottom prices have not yet been reached. The operations of the 77 coke plants in the Connellsville region for the week ending on Saturday, the 13th inst., show 10,895 of the 18,266 completed ovens in blast and 2371 idle. Quotations are made as follows: Furnace coke, \$1.05; to dealers, \$1.15; foundry coke, \$1.25; crushed coke, \$1.50.

James Benbow Elliman, a prominent iron merchant and importer in Pearl street in the days before the war, was buried at Flushing, L. I., 18th inst. He was a native of Coventry, England, and 82 years old at his death. Mr. Elliman came to New York in 1831 as agent for Joshua Scofield & Sons, one of the largest iron houses of Birmingham. He afterward went into the iron business with his brother, forming the firm of Elliman Brothers, of 211 and 213 Pearl street, which continued in business until the breaking out of the war, since which time Mr. Elliman's life was spent in domestic retirement. He was the oldest life member of the St. George's Society, and was noted for the wide extent of his knowledge and open-handed hospitality and benevolence.

The Burden trial at Troy, N. Y., has been postponed until July.

### The New Steamer Puritan.

The palatial steamer Puritan, just completed for the Fall River Line, and which is expected to surpass in several respects her elegant consort, the Pilgrim, went on her trial trip last Monday to test her engines. Only the builders of the engines, Messrs. W. & A. Fletcher, a member of the Fall River Company and a few personal friends were on board. The Puritan went about 5 miles outside of Sandy Hook, a distance of 25 miles, and returned to her pier, covering the 50 miles in about five hours, or an average of 10 miles per hour. The machinery worked to a charm. This vessel is the largest in the line, and her estimated cost is \$1,500,000. Her hull is of steel, built on the double-hull, bracket-plate, longitudinal system, with 96 water-tight compartments. In addition there are six water-tight bulkheads, dividing the hold into seven water-tight compartments. She is supposed to be practically unsinkable. She is 403 feet long on the water-line, 420 feet over, or 30 feet longer than the Pilgrim. Her hull is 52 feet broad and 91 feet over the guards. The depth of her hull is 21½ feet, and she draws 13 feet of water when loaded. The interior of the steamer is finished in white and gold, and she has 350 staterooms, or 100 more than the Pilgrim. It is estimated that she can carry 1500 passengers comfortably. A single screw, driven by a compound beam engine of 7500 horse-power, propels the boat. The high-pressure cylinder measures 75 inches in diameter, with a 9-foot stroke, and the low-pressure 110 inches, with a 14-foot stroke. Her power is about 42 per cent. greater than the Pilgrim's. She has eight boilers, with a working pressure of 110 pounds to the square inch. The Puritan will leave for Newport the latter part of this week to receive her furniture and carpets.

The Eames Vacuum Brake Company, in their new forge shops at Watertown, run their hammers entirely by compressed air. The air is compressed by water-power. It is said that they find not only economy, but greater efficiency, in the use of air for this purpose than with steam. The air pressure is kept at about 80 pounds to the square inch, but if any specially heavy work is required it is quickly brought up to 100 pounds. The action is very quick and sharp, as the free exhaust causes no back pressure, and they are enabled to do with their largest hammer—10 x 28 inches—work that would require a larger steam hammer, using steam at the customary pressure. The compressor is placed in a separate building near the water-wheel. A reservoir is placed near the compressor to take the water of condensation, and another one is connected overhead with the hammers in the forge shop. Compressed air is also used for various purposes in the machine shop of the company. By the use of this compressed air in the hammer all trouble from condensation, which must be present to some degree with steam hammers, is avoided, and the shops are kept cooler without the heat radiated from the steam boiler, pipes and cylinders.

The entrance examinations of the Massachusetts Institute of Technology will be held at Boston and at a number of different points throughout the country on the 29th, 30th and 31st of May.

The Pittsburgh and Lake Erie and New York, Lake Erie and Western roads have announced the following new lake rates from Pittsburgh to Port Huron points, to take effect on the 15th inst: To Marine City, St. Clair and Port Huron, Mich., first class, 40; second, 35; third, 26; fourth, 19; fifth, 17; sixth, 14. Port Sandilac,

San Beech, Osceola, Ausable, Alpina, Cheboygan, Mackinac Island and St. Ignace, 60, 50, 36, 24, 22 and 20 cents per 100 pounds. The difference between these and the rail rates ranges from 5 cents to 1 cent on the different classes. Articles of iron and steel have been made fifth class in less than carloads and sixth class in carloads.

**Drilling Cast Iron.**—L. B. Brickenbridge, the instructor in mechanical engineering in the Lehigh University, has lately been making some experiments for the determination of the pressure exerted in drilling cast iron. He made a cylinder, in which was a plunger, having an area of 10 square inches. Three small grooves were turned in the plunger near its lower end, so as to prevent any leakage of the oil with which the cylinder was partly filled. Two holes were drilled in the cylinder near the bottom, and a steam gauge and an indicator were attached. The indicator cord was attached to the hub on the shaft of the quick return motion lever, in order to obtain diagrams of considerable length. When the piece to be drilled was resting on the plunger a diagram could be taken which would show the pressure exerted in forcing the drill through the work. With ¼-inch twist drill the greatest downward pressure was 400 pounds; with ½-inch, 900 pounds; with ¾-inch, 1100 pounds; with 1-inch, 1450 pounds, and with 1½-inch, 1800 pounds.

The American Society of Mechanical Engineers has changed its quarters from the Stewart Building to No. 64 Madison avenue. The change is desirable, because of the more central location of the new rooms and especially because of their more commodious arrangement. We trust that the society in its new domicile will continue to grow and increase its usefulness as it has in the old.

The New York Sinking Fund Board have approved the preliminary plans and specifications for the new criminal court building in Centre street presented by the sub-committee and ordered the committee to advertise for architects' competitive plans. The building will be five stories high and will occupy the whole block bounded by Centre, Elm, Franklin and White streets, just north of the Tombs. It will be fire-proof throughout, heated by steam and furnished with a sufficient number of elevators, and will be connected with the Tombs by a covered iron bridge.

New Birmingham, Tex., is coming into notice as a prospective iron center. While all sections of the State are spoken of as prosperous, the new town is especially vigorous. Myron C. Wick, manager of the large iron smelting and manufacturing firm of Cartwright, McCurdy & Co., of Youngstown, Ohio, and Robert Bently, the general manager of the Ohio Iron and Steel Company, of Youngstown, who were visitors there recently, expressed the opinion that the quantity and quality of iron ore surrounding New Birmingham, and the success of the State furnace at the penitentiary, were alone sufficient to insure a rapid growth in manufacturing enterprises.

On the 23d inst. Jacob Reese was granted a patent for which an application was filed June 27, 1879, and which, therefore, has been pending for nearly ten years. It is assigned to the Bessemer Steel Company, Limited, of Philadelphia. It covers the process of decarbonizing and desilicizing in a Bessemer converter, and subsequently dephosphorizing in a basic bath in an open-hearth furnace.

W. A. Conenay, of Charleston, S. C., has been elected president of the Bessemer Lands Improvement Company, of Bessemer, Ala.

Marville W. Cooper was appointed by the President Appraiser of Merchandise in the District of New York, on the recommendation of several dry goods merchants. He was a prominent candidate for collector under President Arthur, and is considered to be a very practical man.

Robert P. Porter, the editor and statistician, has received the appointment of Superintendent of the Census, and, besides a salary of \$6000, will have the disbursement of \$6,000,000 per annum.

David Harris, late assistant manager of the lower mills of Oliver Brothers & Phillips, Pittsburgh, was presented with a silver tea service by the employees of the mill on the occasion of his entering into partnership with Baldwin & Graham, stove manufacturers.

Henry J. Redfield, long connected with Morris Wheeler & Co., has associated himself with Ely & Ramsay, stove manufacturers, of Peekskill, N. Y., and 247 and 249 Water street, New York.

T. Guilford Smith is the Buffalo agent of Carnegie, Phipps & Co., of Pittsburgh and Beaver Falls.

James Forrest, secretary of the Institution of Civil Engineers, has sent to those of the American engineers who propose to visit the United Kingdom a list of the Reception Committee, formed exclusively of all members of all classes of the Institution of Civil Engineers. It includes the names of some of the most distinguished men in England.

Judge Kelley entered upon his seventy-sixth year on the 12th inst.

Thomas F. Rowland, proprietor of the Continental Iron Works, Greenpoint, has been ill for several weeks. It was Mr. Rowland who made the contract with Captain John Ericsson to build the ironclad Monitor, which had the famous fight with the rebel ironclad Merrimac. When he went to Ericsson to close the contract he said he would build her for 9 cents a pound. But Captain Ericsson said that not a fraction above 7½ cents a pound would be paid. This offer was accepted, though at a financial loss.

A telegram from Laurel, Md., says the Baltimore Automatic Transit Company have constructed there a circular track, 2 miles in circuit, upon which experiments are conducted. The system of propulsion is much the same as on the ordinary electric railway. The Edison dynamo and the Sprague motor are employed. The overhead rail is the main feature in the system, a double-flange wheel on the car and motor catching upon it when the train is in motion. The idea is to have stations 25 miles or more apart, supplied with dynamos of sufficient power to furnish electric force to drive the train for a round trip. The projectors of this enterprise expect to work a revolution in the carrying of mails and packages.

The Aqueduct Commissioners awarded to Charles W. Palmer a contract for the construction of the iron gatehouse at 135th street for \$6935, and to Cole, Wilcox & Co., for cast-iron piping at shaft 24, section A, for \$4000.

It is understood at the City Hall that Mayor Grant's rapid transit scheme has been killed in the Legislature.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, April 22, 1889.

The progress of the month is precisely in accordance with the gloomy predictions made at the beginning of it by leading members of the trade. The demand continues to diminish in nearly every line. Prices show comparatively little change, however, so far as open quotations are made, but there is reason to believe that these quotations would be generally shaded on transactions of any moment. Inasmuch as the prospects are very bright for an unusually active building season in this vicinity, the carpenters are threatening to strike for a uniform day of eight hours and a uniform wages rate of 35 cents per hour. Should the result be a cessation of building operations for any considerable time, the local iron trade will suffer in a direction which just at present seems most promising.

**Pig Iron.**—The market was very quiet during the past week, but one or two houses reporting anything like a fair trade. The jobbing foundries are melting much less than their usual quantity of iron, and the demand from this source, which constitutes a steady business in good times, has shrunk to small proportions. Consumers of Charcoal Pig Iron are asking in some cases to have deliveries on old contracts deferred from two to three months. There is consequently but a slight demand for Lake Superior Charcoal, and the indications are that if any large buyers were to come into the market concessions would be made on present prices. The Charcoal furnace men are resisting the downward pressure as much as possible, and, if the decision which some of them have made will be adhered to, the chances are against the sale of any considerable quantity at extremely low prices. A great deal of this year's make of Charcoal Iron will be piled to await better times. Southern and Ohio Irons have had a bad week again, only small lots of Soft Irons being called for. Bessemer Pig Iron has not been sold as such for some time. The price is nominally \$17, cash, but round lots could be had a trifle cheaper. Cash quotations are as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago Scotch, \$17 @ \$17.50; Bay View Scotch, \$16.50 @ \$17; Lake Superior Charcoal, \$19; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16 @ \$16.25; No. 2 Foundry and No. 1 Soft, \$15.50; No. 3 Foundry, \$15; Gray Forge and No. 2 Soft, \$14.25 @ \$14.50; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; ditto, lower grade, No. 1, \$17; No. 2, \$16; Alabama Car-Wheel, \$25.25.

**Bar Iron.**—No class of buyers appears to have been in the field to any extent since our last report. Business has been unusually quiet. Prices of Common Iron are maintained at 1.60¢ @ 1.65¢, half extras, f.o.b. Chicago, for carload lots from mill, but sellers intimate that on good orders these rates would be cut very materially. Store trade is fair at 1.80¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—Large orders for Beams were taken last week, and the usual complaints of slow deliveries are being heard with respect to contracts previously placed. The Beam mill of the North Chicago Rolling Mill Company is still shut down, the company having a good stock of Beams of certain sizes yet on hand. The demand for other classes of Structural

material is very light. Prices are unchanged.

**Plates, Tubes, &c.**—The boiler-makers report work very slack, with only a few contracts of any consequence in sight. Dealers in boiler material have therefore had a very quiet week. Prices are unchanged, the mills refusing to go lower than they have gone, and store prices still maintaining the usual schedule.

**Sheet Iron.**—Large buyers find Black Sheets fully \$2 ♢ ton higher than on the 1st of the month. The mills which were disposed to sell at cheap rates have taken contracts covering as much of their capacity as they deem safe, and there is now a decided feeling of firmness along the entire line. No. 27 Common is quoted at 2.95¢, f.o.b. Chicago, from mill, for early delivery. Very little Sheet Iron is now selling from store, and old prices continue—namely, 3.10¢ @ 3.20¢ for No. 27. Galvanized Iron is dull and weaker, but quotations on small lots continue at 65 % off for Juniata and 65 % and 2½ % off for Charcoal.

**Merchant Steel.**—A change for the worse has been made in this line, orders having fallen off quite abruptly. Prices continue nominally as previously quoted.

**Steel Rails.**—Orders for small quantities continue to be received with gratifying frequency by the local companies, but large orders are scarce, although a great deal of heavy business is in sight and only awaits the pleasure of capital. It is rumored that an 8000-ton contract for Michigan was taken at a very low price, but the figures which have been given currency are asserted by the sellers to be wide of the truth. Competition was very sharp, as the place of delivery is easily accessible from either Pittsburgh or Chicago, but it was not necessary to revert to the low price of last fall to get the order. For strictly Chicago business quotations are held at \$30 @ \$30.50.

**Old Rails and Wheels.**—The activity in Old Iron Rails which existed for quite a little time has been checked by the unwillingness of sellers to follow buyers further in the decline in prices. From \$20 to \$20.50 is now asked by holders, and buyers refuse to meet their views. The best offer made by Youngstown mills is \$21, delivered, with a freight rate of \$2.25 from this vicinity. The bulk of the Old Rails which were pressing on this market some time since has now been absorbed, and there is a firmer local tone. The demoralization of a week or ten days since has closed. Old Car-Wheels are very dull. There is now a surplus, which is constantly growing larger, and they are worth probably \$17 @ \$17.50.

**Scrap.**—Consumers seem to be so little in need of stock that dealers are largely refraining from offering it. A light business has been done in Cast at \$12.50 @ \$13, and Mixed Steel was sold at \$11 ♢ net ton. No. 1 Forge is worth about \$18, while No. 1 Mill has been well cleaned up, and would probably command \$18.50 @ \$14. Old Axles are to be had at \$23. Dealers continue to buy stock whenever it is offered to them at prices which would seem to afford them a margin. Some very large transactions have recently taken place in this way.

**General Hardware.**—The demand for Shelf Hardware is excellent, but it is not so strong as it was in March. It is expected to slacken up from this time on for a month or two. The Heavy Hardware trade continues very satisfactory. Wagon stock was in particularly active request, some concerns having done during the past week the heaviest business of the year in this line. With respect to prices, Screws are reported to be among the firmest articles on the list; Rivets are also firm,

but Bolts are suspected of weakness in certain directions, and Nuts have been quite demoralized. In Wooden-Ware a decline of 50¢ on Tubs is noted.

**Nails.**—A curious ruling of the Western Classification Committee puts Wire Nails in kegs in the second class, thus greatly advancing freight rates on them. It is believed that this is merely an error, which will be corrected when the facts are laid before the committee. The factories are having a fair demand from large buyers for both Steel Cut and Wire Nails, but without special feature, except that the Jefferson schedule on Steel Nails is being beaten by some of the competitors, and it is a difficult matter now to determine the prevailing factory price. Jobbers quote small lots of Steel Nails at \$2 and Wire Nails at \$2.40, with 5¢ off for mixed carloads.

**Barb Wire.**—The demand is more urgent than it has been for nearly a year. The manufacturers are so far behind in making deliveries that it is getting to be difficult for jobbers to fill their orders. The price is a little stiffer, but quotations are unchanged at 2.80¢ for Painted and 3.40¢ for Galvanized in small lots.

**Pig Lead.**—The market is again drooping and consumers are holding off in anticipation of lower prices. Sales of about 400 tons were made at and around 8.47½¢. At the close 8.45¢ was bid.

**Manufactured Copper.**—Although combination prices are still quoted, an indication of the future has appeared in the offers made to dealers of lots for future delivery at lower prices, with a guarantee against a further decline.

The removals to the Rookery Building, corner of Adams and La Salle streets, during the past week embraced quite a number of Iron and Steel firms, as follows:

Pickands, Brown & Co., agents for the Bay View, Union, Joliet, Dexter, Struthers, Wheeler and Crafts brands of Bessemer, Coke and Soft Irons and the Hinkle, National, Fayette and Leland brands of Lake Superior Charcoal Irons, and dealers in Iron Ore, Old Iron Rails and Old Steel Rails. They will occupy rooms 1007, 1009 and 1011.

The Calumet Iron and Steel Company, manufacturers of Bar Iron, Steel Nails, Fish-Plates, &c. They will occupy a suit of offices, with No. 519 as their general office.

George G. Spencer, sales agent for the Laughlin Nail Company's Steel Nails and the Aetna Iron and Steel Company's Bar Iron and Iron and Steel Plates and Sheets, and the Iron City Mfg. Company's Nuts. He will occupy room No. 556.

S. H. Fernandez, sales agent for the brands of Pig Iron handled by the house of Matthew Addy & Co., of Cincinnati, embracing Ohio and Southern Coke Pig Iron and Alabama Car-Wheel Pig Iron.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., April 23, 1889.

**Pig Iron.**—There is no special movement in the market at present, and in a general way things are just about as they were a week ago. The demand may be a trifle stronger, but with so many anxious sellers it is impossible to stiffen prices. All the same, the feeling favors improvement, and the conditions seem to warrant it. There is something of a scarcity of Bessemer Iron, and even a slight increase in the demand would be likely to affect prices of that class of Iron at once. As a matter of fact, it would not be very difficult to stiffen the entire line, with a very moderate increase in the demand, but while sellers continue drumming for bids

buyers feel no anxiety in regard to the future. The position to-day, therefore, seems to be that while stocks are light and prices low, the hesitancy of buyers and the urgency of sellers combine in keeping them low, and probably will continue to do so until the demand develops some degree of scarcity. It is impossible to say when this will occur, but as it is the unexpected that generally happens it may be so in this case. In any event it is not likely that much risk will be run in stocking up with good Iron at to-day's prices, although it is doubtful if that could be done to any extent without precipitating an immediate advance. Meanwhile business is being done at from \$17.50 to \$18.50, delivered at tide, for good to choice No. 1; \$16.50 @ \$17 for No. 2, and \$15 @ \$15.50 for Gray Forge. Southern (and some Western) Irons are being sold at 50¢ @ \$1 below these quotations, at adjacent points, and in some cases deliveries are made in Philadelphia at about \$14.50 for Gray Forge and \$17 for No. 1, but all depends on circumstances. What one might do under a little pressure is not accepted as any rule for another with a better Iron, or better situated financially. It is a waiting market, and as yet without any positive indications as regards the immediate future.

**Blooms.**—A tolerably fair business is being done in Steel, but there is no change in prices, and in actual transactions they depend a good deal on quantity, time for delivery, and requirements as to analysis, &c. In a general way quotations are about as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 1/2 "Bloom" ton of 2464 lb.

**Muck Bars.**—Business has been very dull during the past week, but prices are firmly maintained. There are buyers at \$26.50, delivered, but \$27 seems to be an inside figure for good Bars, and not many for sale even at that figure. Holders are a little timid in quoting for large lots, especially for summer deliveries.

**Bar Iron.**—There is a steadier feeling in Bars, based not so much on any particular increase in the demand as in the reduced supply locally, owing to two or three mills being shut down. Sellers are asking half a tenth more than they sold at a couple of weeks ago, and the chances are that the advance will be paid, as there is some probability of scarcity as the hot season approaches. Prices are miserably low yet, however, and the outlook far from encouraging, although, of course, the trade may jump into activity all of a sudden. There is some talk of large orders for cars, but so far there is nothing definite that can be given on that point. Prices for Bars are nominally 1.75¢ @ 1.85¢, and although there is a good deal of cutting on desirable orders, quotations are more nearly maintained than they were a week or two ago.

**Plate and Tank Material.**—The mills are all doing fairly, and there is a manifest disposition to ask more money on new business. A good deal of the activity is caused by the demand for material bought some time ago, and on which postponements had been asked. There is a pretty good demand, too, for new work, so that on the whole the Plate trade appears to be improving. Ship-builders have taken about 1500 tons during the week, and tank-builders nearly 500 tons, besides quite a number of orders of a miscellaneous character. Mills are full of work, therefore, until well toward midsummer; hence the unwillingness of sellers to duplicate some of their recent sales. Although firmer, prices are not notably higher, and are usually about as follows: 1.90¢

@ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 3 1/2¢.

**Structural Iron.**—While there is nothing specially new in the market, the feeling is better, and work at the mills more general than it has been for some time past. The outlook is decidedly encouraging in this department, and there is no reason to expect anything but activity for a long time to come, as large contracts are in hand or in prospect. Prices remain as before, viz.: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2.05¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—The demand is about fair, and prices steady. Business to date has been about an average one, but as some large buyers have yet to place their orders, it is expected that the near future will develop greater activity, as there is already a good deal of inquiry. Meanwhile quotations remain about as follows:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined No. 28.....	3.60¢
Common, 1/4¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3 1/4¢
Best Soft Steel, Nos. 21 to 24.....	3 1/2¢
Best Soft Steel, Nos. 25 to 26.....	3 3/4¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, 1/4¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67 1/2 %

**Steel Rails.**—The demand does not improve, and orders for Rails are confined mostly to small lots, although there is some inquiry for lots of from 2000 to 5000 tons each. The feeling among sellers is firm, and at the moment it would be difficult to secure concessions, as manufacturers appear to have a good deal of confidence in the ultimate course of the market.

**Old Rails.**—The offerings are small, but there is so little demand that prices have not been maintained. Several hundred tons of T's were sold at equal to \$22.50 Philadelphia, and they are now offered at that figure, with \$22 bid. The market is unsettled and prices liable to sudden changes, according to circumstances.

**Scrap Iron.**—The market is extremely dull, and prices are easier all around. Asking prices about as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—The demand is improving and on the whole the feeling is much better than it has been. Prices are steady, with discounts about as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62 1/2 %.

**Nails.**—The demand is very much better, and the feeling in regard to prices is also more confident. Under forced sales, in large lots, low prices have been accepted, but for good brands \$1.80 @ \$1.85 is obtained for carload lots, and \$1.90 @ \$2 for lots from store. The comparatively small output, combined with the heavy demand, ought soon to put things in better shape.

The address delivered by Andrew Carnegie before the Legislature of Pennsylvania, entitled "Pennsylvania's Industries and Railroad Policy," has been issued in pamphlet form.

## St. Louis.

OFFICE OF *The Iron Age*, 212 N. Sixth st.,  
St. Louis, April 20, 1889.

**Pig Iron.**—A careful review of this department during the past week shows little change from previous reports. The volume of business is small and is daily growing less, and prices, which are at present at the lowest point, are weak and sensitive, and it is quite probable would be shaded somewhat on a good-sized order. Stocks are gradually increasing, and are likely to be thrown on the market at any moment, which, to say the least, will prove disastrous, at this period especially. Furnaces are generally disposed to make the best of things, but say there is very little in the outlook on which to base any calculation for early improvement, and say it requires considerable drumming to make what few sales are reported, as consumers seem to be very well supplied for the present, and concessions offer no inducement for them to become purchasers.

**Bar Iron.**—This department is in more or less of a mixed condition. Some mills report a heavy demand, while others are complaining for want of orders. It is reported that a local mill went into the market last week and took quite a number of orders at prices that cannot be met by the other mills with any profit to themselves, consequently the market is in a sensitive condition, and any movement either way is likely to influence its future course. Prices are weak and for small lots 1.75¢ @ 1.80¢ is quoted, and carload lots from 1.60¢ to 1.70¢, according to circumstances.

**Barb Wire.**—There is a gradual improvement in the volume of business during the past two or three weeks. Mills are all pretty well employed, and prices, while not quotably higher, show some signs of strength, and mills seem disposed to hold up prices, and it is intimated that some of the sales made the early part of the month could not be duplicated. Mills are quoting from \$2.80 to \$2.85 for Painted, and from \$3.40 to \$3.45 for Galvanized. Carload lots are quoted at from \$2.70 to \$2.75 for Painted, and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

## Cleveland.

CLEVELAND, April 22, 1889.

**Iron Ore.**—The first vessel load of new Ore reached Cleveland yesterday. During the present week not less than 50,000 tons will be unloaded at Lake Erie ports. Along with the first cargoes of new Ore has come a strong demand from buyers and several very fair orders have been placed. Minnesota Ores are going rapidly at \$5.75, delivered at Lake Erie ports. A large block of Chapin Ore, second quality, has been sold at \$5, and over 90,000 tons of Dunn Ore, at \$4, f.o.b. vessels Cleveland, Fairport and Ashtabula, has been disposed of. The Florence Mine has made heavy sales, but at such varying prices that it is difficult to give quotations. The Commonwealth Mine has disposed of about 40,000 tons of new Ore at \$4 and liberal quantities of Ore from the Aurora and Iron King have brought \$5.25. Quotations for all grades of Ore are based upon the established price for the output of the Republic Mine—\$5.75 per ton. Probably 150,000 tons of Republic Ore have already been sold. Orders are also reported for Chippewa Ore at \$5 and for Champion at \$5.75. Sales to date, including the Chicago consolidated steel companies' purchases, are believed to aggregate 1,250,000 tons. The Eastern furnacemen having been assured satisfactory freight rates from Buffalo to the furnaces, have already purchased 150,000 tons more

Ore than was unloaded at Buffalo last season. They are still in the market and promise to care for at 700,000 tons of Ore this year. Many new contracts for carrying Ore are reported to-day at 90¢ from Escanaba; \$1.10 from Marquette and \$1.25 from Two Harbors and Ashland. Quotations are as follows:

No. 1 Specular and Magnetic Ores, Bessemer quality	\$5.75 @ \$6.25
No. 1 Specular and Magnetic Ores, Non-Bessemer quality	4.75 @ 5.25
Red Hematite Ores, Bessemer quality	5.00 @ 5.25
Red Hematite Ores, Non-Bessemer quality	4.00 @ 4.15
Menominee Range Ores, Bessemer quality	5.00 @ 5.25
Menominee Range Ores, Non-Bessemer quality	4.00 @ 4.10
Gogebic Range Ores, Bessemer quality	5.25 @ 5.50

**Pig Iron.**—The market retains all its discouraging features, in spite of which dealers refuse to believe that the hoped-for activity can much longer be delayed. Sellers have steadfastly refused to make additional concessions in order to force sales, and the few transactions reported have been at last week's quotations. The whole situation is so entirely out of harmony with the demand and prices paid for new Ore that the present depression is calculated to continue no longer than May 1. Sales during the past week have been too scattering and in too small amounts to warrant quotations of any reliability.

**Scrap Iron.**—Buyers still decline to give over \$21 for Old Americans, while Old Car-Wheels can be bought in liberal quantities at \$19.

**Nails.**—Steel Nails are still bringing \$1.90, but Cut Steel Spikes have declined to \$2.15. Steel Wire Nails at \$2.35 are in steady demand.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, April 22, 1889.

**Pig Iron.**—There has been scarcely enough business in Pig Iron in the local market during the week just closed to be a fair test of the prices current. The sales have all been small. The prices realized do not form a criterion for round lots for future delivery or even for near-by months. During the prevalence of such extreme dullness, however, there is a natural tendency for the market to sag, which disposition, however, may soon be erased by the occurrence of increased business. In the meantime new orders, though small, are being only secured by a sacrifice of, or rather by concessions in, prices. No. 8 Foundry and Mottled Iron show most weakness. At the same time, there is no pressure to sell round lots by either Southern or Northern stacks, although there is an indication of increased stocks. Producers adhere to their belief of an improved market during the latter part of the year, and the financially strong furnaces can well afford to wait for the favorable turn. With others, however, it may be a matter of necessity, but, apparently, all are inclined to sell as little as possible. On the other hand, buyers meet with little encouragement to make large purchases, and even when covering present wants they succeed in drawing the seller to them rather than otherwise, which gives them some advantage. Forge Iron continues to show less relative weakness than Foundry grades, but Mottled Iron has been sold lower. Car-Wheel Iron, too, is lagging, especially the lower numbers. The following are the approximate prices current here at the close, for cash, f.o.b.:

### Foundry.

Southern Coke, No. 1 (new classification)	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification)	14.00 @ 14.50
Southern Coke, No. 3 (new classification)	13.50 @ 14.00

Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 15.25
Mahoning and Shenango Valley	16.50 @ 17.00
Hanging Rock Charcoal, No. 1	21.00 @ 22.00
Hanging Rock Charcoal, No. 2	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2	17.00 @ 18.00

### Forge.

Strong Neutral Coke	13.25 @ 13.50
Mottled Neutral Coke	12.00 @ 12.50
Gray Forge	13.00 @ 13.50

### Car-Wheel and Malleable Irons.

Southern Car-Wheel	20.00 @ 25.00
Hanging Rock, Cold Blast	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable	20.50 @ 21.50

**Manufactured Iron.**—The only feature of prominence has continued to be dullness, but there has been no change in prices.

**Nails.**—There has been an increased demand at the lower prices current. 12d @ 40d sell at \$1.90 @ \$1.95 per keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.45 @ \$2.50 per keg.

**Old Material.**—There has been very little trading in the local market in either Rails or Wheels, and while there is no pressure to sell there are no importunate buyers. Old Rails are quotable at \$20 @ \$20.50 and Old Wheels at \$18 @ \$18.50 per ton, spot cash.

Messrs. Talbott & Lupton, Iron and Steel factors, with offices at Nos. 1 and 2 Wiggins Block, announce that they will on May 1 remove to No. 8 of the same block, where they will have much more commodious quarters. They also invite attention to the fact that they are special representatives of the Roberts Wire Company, Belmont Nail Company and Hartman Mfg. Company.

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, April 22, 1889.

**Pig Iron.**—While prices are low, Iron is certainly not a drug in the market. It is true that there is some piling up of stock at the yards, but nearly all the furnaces whose Iron has a reputation are disposing of their output at prices that are paying them some profit; and there is no intimation so far of any of them shutting down. Three large stacks in this district are out for the purpose of relining, but which, as soon as completed, will again go in, with a greater output than ever. There is much difficulty in getting an expression from furnace owners as to the future; and the probability is that but few of them have any opinion to express—only that they all intend to keep pegging away as long as they can get a dollar or two profit on a ton, which most of them say they can still do. Within the past few days there has been quite a disposition on the part of speculators to again enter the field, and quite a number of round lots are being piled up at the furnace yards. This no doubt gives an appearance of the furnaces piling up more Iron than they really are. Two of the Sheffield stacks have again gone in blast, and they state they have enough placed to go on for some two or three months at figures that are remunerative. The owners of the new plants that have been projected within the past few months, some of which have been commenced, are still sanguine of the future of the Pig-Iron industry of the South, and continue to put in their money; and they are going steadily forward in their construction, the owners arguing that there never was a cheaper time than now for the construction of such works, which is no doubt correct. The market is ruling at \$13 @ \$13.50 for favorite brands of No. 1 Foundry and \$12 @ \$12.50 for No. 2, in round lots, and about 75¢ higher for car lots.

## Louisville.

LOUISVILLE, KY., April 22, 1889.

**Pig Iron.**—The market has been quiet during the last week, with very little doing. Buyers of Iron have largely laid in supplies for the future. Offerings have not been heavy, as most of the furnaces have made contracts for several months ahead. The blowing out of one or two Southern furnaces somewhat relieves the pressure of the balance to sell. It, however, has not resulted in any increase in prices, as offerings are low and it is not generally anticipated that much improvement will occur in the immediate future. Prices remain about the same:

Southern Coke, No. 1 Foundry, new classification	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification	13.75 @ 14.25
Gray Forge	13.25 @ 13.75
White and Mottled, different grades	12.75 @ 13.25
Silver Gray, different grades	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry	16.25 @ 16.75
No. 1 Mill	14.75 @ 15.25
Southern Car-Wheel, standard brands	21.75 @ 22.75
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry	19.50 @ 21.00
Hanging Rock, Cold Blast	20.75 @ 22.75

Macfarlane & Mordue, of Louisville, Ky., successors to Kent, Macfarlane & Mordue, have now completed their arrangements for conducting a storage business in Pig Iron. Their yard is 150 feet front and 400 feet deep, situated on the line of the Louisville and Nashville Railroad, and enjoys the best switching facilities. Sheds and bins have been erected for the unloading and assorting of Scrap Iron, while the balance of the yard is used for the storage of Pig Iron. Two side-tracks extend into the yard, on which 20 cars can be accommodated, and Pig Iron can be unloaded or loaded from either side of them. Negotiable warehouse receipts are issued on all the material stored in the yard. Quite a quantity of Pig Iron has already been received on storage and a large lot of old car-wheels. The owners of the yard will in the near future put in machinery for cutting up old rails and scrap. Their city office is located in the Kenyon Building.

## Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, April 24, 1889.

The strike at the new Rail mill of the Allegheny Bessemer Steel Company still holds out, but thus far there has been no serious trouble, and the company have invoked the aid of the proper authorities, so that there is not likely to be any. It is evidently the intention of the company to make the mill non-union. Two of the leading spirits in the mill, Messrs. Park and Clarke, are at the head of non-union mills, the former with the Black Diamond Steel Works and the latter with the Solar Iron Works, both of which are operated by non-union men. It is, therefore, as already stated, the intention of the management of the new mill to make it non-union, and as they have had considerable experience in the way of strikes they have not gone into it unadvisedly or without counting the cost.

Some of the Monongahela River coal works have shut down, and it is expected that there will be a pretty general suspension within the next few weeks. All the down-river markets are overstocked, and not for years has the river coal trade of Pittsburgh been in as depressed a condition as at present.

The Iron wage scale is now renewed on the 1st of July instead of the 1st of June, as was always the time for adjustment until within the past year or so. Mill owners say they must have a reduction in order to compete with the cost where

skilled labor is so much cheaper; this will doubtless be resisted by the Amalgamated Association, and it is difficult to foretell what the outcome will be. As stated several weeks ago, some of the iron-workers favor a general shut down for a couple of the hot months, July and August, but whether mill owners will agree to this remains to be seen.

**Pig Iron.**—Dullness still rules, and, while hopes are entertained of an early improvement, the outlook in some respects is not as encouraging as it might be. Brokers say that not for years have they known business to be so dull at this season of the year. Some of our oldest furnace agents did not enter a single sale on their books during the week; and they are making but little effort to sell under present conditions. We understand that offers have been made to buy good brands of Gray Forge at \$14, cash, but thus far no sellers can be found under \$14.25, cash. Foundry Irons continue very dull, and there does not appear to be as much inquiry for Bessemer as there was a few weeks ago. Quotations may be fairly made as follows:

Neutral Gray Forge.....	14.00 @ \$14.25, cash
All-Ore Mill.....	15.25 @ 15.75, "
White and Mottled.....	13.00 @ 13.50, "
No. 1 Foundry.....	16.50 @ 17.00, "
No. 2 Foundry.....	15.50 @ 16.00, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Cold Blast Charcoal.....	24.00 @ 27.00, "
Bessemer Iron.....	16.00 @ 16.50, "

**Spiegel.**—Is quoted at \$29.50 @ \$30, cash, for 20 %, and Ferromanganese \$58 @ \$58.50 for 80 %.

**Muck Bar.**—There is some inquiry, but the market continues weak; we are advised of sales at \$26 @ \$26.50, cash, but few sellers as yet under \$26.50, cash. Makers claim that under the most favorable circumstances it is difficult to more than get a new dollar for an old one, and that if they happen to meet with an accident to their machinery they are out of pocket.

**Manufactured Iron.**—There is but little change to note in the condition of the market for Merchant Iron; demand continues light for the season, and prices are unsettled and unsatisfactory. We continue to quote upon a basis of 1.60¢ @ 1.70¢ for Bars, 60 days, 2 % off for cash. Old-Rail Iron, it is said, is being sold by Mahoning Valley mills upon a basis of 1.50¢ for Bars. Skelp Iron, on which several of the mills are running full (one of them reports having orders booked sufficient to keep it busy until the 1st of July), is still quoted at 1.65¢ for Grooved and 1.90¢ for Sheared.

**Nails.**—There is no improvement to note in the Nail trade, and apparently but little prospect of any; only two concerns in Pittsburgh are paying any attention to Nails, and they are not working half time. We continue to quote full card rates, but it is possible that for a desirable order, of which there are very few offering, concessions would be made. It is reported from Wheeling that the Nail trade there is just as poor as it is here, and that an effort is being made there to have the wage scale reduced. Carnegie, Phipps & Co. are reported as pushing the Wire-Nail trade with considerable vigor, and there is no disputing that the Wire is to a considerable extent supplanting the Cut Nail throughout the whole country.

**Wrought-Iron Pipe.**—There is still considerable activity in large-size Pipe, and some of the mills have all they can do, but the smaller sizes continue very dull. The Standard Oil Company have placed some large orders within the past few weeks, and it is to be hoped that other buyers will make their appearance before long. The combination prices are being faithfully adhered to, which to manufacturers is encouraging. It may be stated that the combination rates are low enough,

and one object in keeping them low was that there would be less temptation to cut. Discounts on Black Butt-Welded Pipe 55 %; on Galvanized do., 47½ %; on Black Lap-Welded, 67½ %; on Galvanized do., 55 %; Boiler Tubes, for 2 to 2½ inch, inclusive, 62½ % off; Casing, 5½-inch, 62½ % off; other sizes, 60 % off; 2-inch Tubing, 13¢ per foot, net; 3-inch Line-Pipe, 20¢ per foot; 6-inch do., 53¢; 8-inch, 90¢.

**Old Rails.**—Continue dull and prices are weak and drooping; sales of 650 tons reported at \$22.50 for American. There are but few offering, but the demand is light. Old Steel Rails are in fair request; Short Lengths quotable at \$17.50; Sale, 200 tons main track, long lengths, at \$20.

**Steel Rails.**—Heavy Sections are still quoted at \$26.50 @ \$27.50, cash, at mill, according to size of order, delivery, &c. The mill of the Allegheny Bessemer Steel Company, as noted elsewhere, is stopped in consequence of the men being on a strike.

**Railway Track Supplies.**—No change in prices. Spikes, 2¢, 30 days, f.o.b. cars at works. Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

**Billets, Blooms, &c.**—Bessemer Steel Billets and Blooms are still quoted at \$27 @ \$27.50, cash, according to size, quality and delivery. Domestic Bloom and Crop Ends may be quoted at \$17.50 @ \$18.

**Old Material.**—Continues dull, hardly enough doing to establish prices. No. 1 Wrought Scrap, \$19, net ton; Wrought Turnings, \$18; Car Axles, \$24.50 @ \$25; Cast Scrap, \$14 @ \$14.50, gross; Cast Borings, \$11 @ \$12; Old Car-Wheels, \$19

## Detroit.

WILLIAM F. JARVIS & Co., under date of April 22, 1889, report as follows: While the market for the past week has been by no means dull, yet there seems to be a somewhat undecided feeling among buyers. Although stocks in consumers' yards are in most cases quite small, orders are placed only for limited quantities and for reasonably prompt shipment. Lake Superior Charcoal continues in fair demand, and some good sales of special brands have been made. Southern Irons are being offered at very low figures, and certain brands of Ohio Coke Irons are offered below prices asked three weeks ago. We quote for the present as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.50 @ 19.00
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.50 @ 19.00
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery..	18.25 @ 18.75

## New York.

Office of The Iron Age, 66 and 68 Duane street, New York, April 24, 1889.

**American Pig.**—The majority of sales agents and commission merchants report the market dull and, generally speaking, in an unsatisfactory condition. Current business is light, though in the aggregate it is up to that of last year. Consumers, however, are not buying more than to cover early requirements, and concessions would not apparently tempt them. Southern Irons are offering at \$16.75 @ \$17 for some brands, and it is probable that for some desirable orders lower figures would be accepted. We quote Northern standard brands \$17.50 @ \$18 for No. 1, \$16.25 @ \$17 for No. 2 and \$15 @ \$15.25 for Gray Forge. The latter would not probably fetch the lower price if any effort were made to press it for sale.

**Scotch Pig.**—The market is exceedingly dull, high cost making it difficult to

sell below our nominal quotations: Coltness, \$21.50 @ \$21.75; Summerlee, \$21.25 @ \$21.50; Langloan, \$21, and Dalmellington, \$20 @ \$20.50. Mahoning Valley Scotch can be laid down here at \$19.50 @ \$20, and deserves, as it is given, the preference.

**Spiegeleisen and Ferromanganese.**—The market is quiet. A block of 5000 tons of 20 % German Spiegeleisen has been offered at \$27.50 and could probably be bought at less. A lot of a little less than 1000 tons of Domestic 20 % Spiegel has been sold at \$27.75 at furnace. We quote Ferro. \$56 @ \$56.50, ex ship.

**Foreign Ore.**—The market is very quiet, little business being done, except an occasional cargo of Ore for the manufacture of Special Low-Phosphorus Pig. Such Ores as the Elba and Marbella sell at about 11¢ per unit. Freight is a little lower, say 15/6 from Elba, and 14 @ 14/6 from other Mediterranean and Peninsula ports.

**Structural Iron and Steel.**—A number of contracts for large buildings in this city are in the market. We continue to quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—One of the leading mills in the Pittsburgh district has withdrawn from the market at present prices. Other sellers are still very eager for business, however. Thus Steel Tank Plates have sold recently, for a moderate lot, at 2.15¢, delivered. We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.4¢; Flange, 2.55¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

**Bar Iron.**—For large lots, Common is being offered at 1.55¢, delivered. The market remains dull. We quote: Carload lots on dock, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Hoops.**—We note a sale by a mill in Central Pennsylvania of 1000 tons of Iron Hoops at private terms. We are informed, however, that the price was lower than Foreign Steel Hoops can be laid down for, although the latter are still lower than the domestic article.

**Steel Rails.**—Sales by Eastern mills have been confined to a few moderate-sized lots, among them one of about 5,000 tons to a Southern road, Savannah delivery, at a shade under \$27 at mill. In the West a Pittsburgh mill has secured the Louisville and Nashville contract of 15,500 tons at private terms, for delivery till May, 1890. We note also a sale of 1000 tons delivered at East St. Louis at \$29.25. There is some Southern business in the market, aggregating about 20,000 tons, including a 12,000-ton lot, which can probably be best reached by one of the Pittsburgh mills. We continue to quote \$27 @ \$27.50 at Eastern mill for fair-sized orders.

**Old Rails.**—Among the transactions reported is a sale of 1700 tons by an Eastern road to a Spike mill at \$22, New Haven. It is stated, however, that this price was paid as an inducement to secure an order for 2000 kegs of Spikes for the road selling the old material. We note also the sale of a few hundred tons of Old Rails to a Virginia mill at \$22 delivered, which it is reported netted the railroad about \$19, deducting freight. We quote \$22.50 @ \$23, nominally.

**Scrap Iron.**—This market is featureless and dull. Buyers' ideas of prices do not quite come up to those of sellers, who are accumulating stocks rather than make the concessions necessary to effect sales. Prices are firm at about the following figures: No. 1 Scrap, \$20.50 @ \$21.50,

for carload lots, delivered; Turnings, \$13 @ \$18.50, do.; Cast Scrap, \$15.50 @ \$16, do.; Cast Borings, \$9.50 @ \$10.

**Rail Fastenings.**—The market is weak and quiet, with Spikes selling, delivered, in normal lots at \$1.95 @ \$2 and Angle Plates at \$1.75 @ \$1.80.

**Cotton Ties.**—Business is quite active, with prices at \$1.10 @ 40-lb bundle, New Orleans delivery.

H. L. Waterman, Mills Building, is now the agent for the products of the Hartman Works of Carnegie, Phipps & Co., viz.: Cold Die-Rolled Steel, Merchant Steel, Steel Wire Nails and Copper Wire.

## Financial.

Centennial preparations and the Easter holidays have diverted attention from business to some extent, and among certain classes of traders the absence of expected buyers is interpreted as meaning that customers have deferred their movements in order to take advantage of low fares fixed for centennial visitors. It looks as if the first three days of next week are to be close holidays so far as this city is concerned. From one cause or another business does not altogether meet expectations, particularly as to the profits realized. Accounts from a distance indicate a seasonable increase of business at many points, although at Chicago "a particularly economical feeling" is said to exist in agricultural sections. The situation in Chicago, according to the *Inter-Ocean*, shows that "general business is unusually active in the city and the country tributary to that market. At St. Paul sales are said to be largely in excess of those of last year, the season being nearly three weeks earlier. Improvement in the lake regions will be more decided when advantage can be taken of lower rates for freight. Clearing-House returns from forty-two cities show an aggregate increase of 8.8 % compared with last year. In New York the gain is 8.8 %; outside of New York, 11.7 %. Boston gains 14.9 %. San Francisco, 11.9 %; Cincinnati, 4.2 %; Pittsburgh, 17.8 %; New Orleans, 20.4 %; Louisville, 24.1 %. Philadelphia, St. Louis and Baltimore decline moderately. The most important development of the week is the decision of the Interstate Commerce Commission, holding the Canadian roads strictly amenable to the Interstate law. As the provisions of the law can be enforced by a suspension of the privilege of transporting goods out of and into the United States again in bond, it is reasoned that the last grievance the railroads had against the Interstate law has disappeared. Crop accounts are good. Rains have fallen in all parts of the spring-wheat sections in the Northwest. A reduction of 50 % in freight rates between New York and Mexico has been made by the railroads from this city, making rates 65¢ @ 100 lb, against \$1.80 previously. Colonel Erhardt, the new Collector of this port, will assume the functions of the office on May 5.

The Stock Exchange markets were moderately active, transactions being confined to professional traders. The future course of prices is discussed with a wide variance of opinion. The very favorable bank statement had no influence. One feature was a fall in Hocking Valley, due to the bad condition of the soft coal trade. The volume of business done on the Stock Exchange on Tuesday was small, and as a rule prices moved within a narrow range. The interest of the day is centered in sugar trusts, gas trusts, Union Pacific and the stocks of other roads in the last-named system. The trust shares were quite active and displayed considerable irregularity. Union Pacific was sold by local interests,

but was bought by the foreign houses to a good aggregate amount. The bond market was a feature, particularly Reading generals.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	108
U. S. 4½, 1891, coupon.....	108
U. S. 4, 1907, registered.....	129½
U. S. 4, 1907, coupon.....	129½
U. S. currency 6s.....	121

The weekly statement of the Associated Banks showed a large increase in reserve, amounting to \$6,021,100, or 50 % larger than the week previous. This makes the surplus reserve now held \$12,067,210, against only about \$1,409,000 a fortnight ago. In loans there was a contraction of \$549,200. Specie increased \$6,537,300, and legal tenders \$1,106,600; deposits, \$6,491,200. The operations of the banks with the Sub-Treasury were the chief source of gain, amounting to about \$4,500,000. The currency movement was also in favor of the local banks. The extreme ease of money here and in Europe has stimulated purchases of lands by investors. The inquiry for short-time loans was insignificant, and the demand for longer dates was promptly met, the result being shown in the comparatively low rates of 3 % for 60 to 90 days; 3½ for four months, and 4 for from five to eight months. Commercial paper is in good demand and the supply is only fair. Rates are 4 to 4½ % for 60 to 90 day indorsed bills receivable.

The President appointed E. S. Lacey, a practical banker of Charlotte, Mich., to be Comptroller of the Currency. Exports of specie for the week amounted to \$692,000 and the imports to \$227,000.

The market for sterling is dull. The Bank of England rate was reduced from 3 % to 2½ %. The posted rates in New York are \$4.87½ @ \$4.89½. The liquidator of the Panama Canal Company made an unsuccessful attempt to borrow \$3,000,000 in London for the expenses of a survey and the maintenance of the canal works. His failure implies that within a few weeks the machinery along the canal will be abandoned.

The prices of commodities, excepting sugar and cotton, continue to droop. Breadstuffs were weak and lower again, on the influence of fair weather West and a month earlier wheat harvest than a year ago, according to advices from the Southwest, and as indicated by the heading out of the winter crop. This depressed the market daily, and even the visible supply decrease had no effect to rally the market. Corn was firm, on temporary scarcity, caused by the fire at the New York Central elevators, checking export demand. The export movement of provisions continues to be largely in excess of last year's. There is still an absence of inquiry for grain vessels to load at Atlantic ports. Sugar and cotton are higher. Coal is depressed. The Department of State is informed that the Canadian Government has continued the special rates of last year on the Welland Canal business.

The imports of merchandise at this port during the week were valued at \$9,083,000, of which about \$2,200,000 represents dry goods. Since January 1 the total is \$159,458,000, against \$155,438,000 for the same time last year.

The certificate of incorporation of the Edison General Electric Company was filed by Henry Villard and Thomas A. Edison and associates to carry out arrangements for consolidating the Edison Electric Light and Mfg. Companies. The capital stock of the company is \$12,000,000.

The Bureau of Statistics reports exports of breadstuffs for March to have been \$9,636,482, an increase of about \$350,000 over the exports for March, 1888. The total exports of beef and hog products for

March were \$8,125,068—an increase of nearly \$3,000,000. The exports for the five months ending March 31 were \$41,571,715—an increase of \$9,000,000 over the exports for the corresponding period of the last fiscal year. It is worth noticing that in exports of lard alone there was an increase during the month of over \$1,000,000 worth, and during the five months an increase of nearly \$4,000,000.

## Metal Market.

**Copper.**—Spot Copper declined in London since our last week's report from £37. 5/ to £36. 17/6 yesterday, and futures from £37. 10/ to £37. 5/; sales 1500 tons. One dispatch was received from Boston stating that in their negotiations with the parties in Europe the American representatives desired to fix the price of the metal at from £40 to £45, while the Rio Tinto people want it to be £35, and the bankers desire as much as £50; furthermore, that there are hopes of having the accumulated stock held for six months and the output curtailed. Another dispatch (from Paris, April 17) speaks of a stormy discussion that took place between the representatives of the Copper mines resident in London and a banking firm of high standing. The Bank of France, the Credit Foncier and Baron Hirsch are said to hold jointly 40,000 tons, the Banque de Paris 20,000, and other firms 50,000, and that the general public is of opinion such stocks cannot be realized except at a loss to the holders. A third message (Paris, April 19) announces that the shareholders of the Comptoir d'Escompte have filed the necessary number of shares to enable them to agree on a resolution legal in its effects at the general meeting to come off on April 29. Meanwhile, M. Moreau, the liquidator of the said bank, has proceeded to London in order to make an effort to get the same released from the guarantees given to English and American mines in support of the collapsed Société des Métaux. M. Moreau bases his hopes upon the decision of the Supreme Court in the "Terrencire Iron case" years ago. He thinks the present case of the Comptoir d'Escompte guarantees is identical with the Terrenoire case. Nothing has occurred in our own market pending these steps taken in Europe. Nothing has been sold in the open market of Lake Copper; casting brands are obtainable at 12½¢ @ 13¢. Electrolytic, guaranteed quality, has sold at 18¢. Parties interested in England have subscribed a couple of thousand pounds sterling to pursue the Comptoir d'Escompte directors and those of the syndicate personally.

**Tin.**—London improved for the week from £91. 15/ to £92. 12/6 yesterday, and futures from £92. 15/ to £93. 5/; sales 200 tons. The consumptive inquiry being light in our own market, and but little speculative inclination extant, sales were confined to a few small lots, 10 tons May, at 20.65¢; and 10 September, at 20½¢, spot ruling toward the close at 20½¢ @ 21¢, April being offered at 20.90¢, and May at 20.80¢, with 20.65¢ offered for both. The closing price of spot Tin in the open market is 20½¢ @ 21¢ at noon to-day. At the Metal Exchange to-day 25 tons July, 25 tons August and 25 tons September sold at 20½¢. Dealings outside of the exchange are active, the large metal firms having sold considerable quantities of Tin, chiefly for shipment. One leading concern has averaged in its sales about 25 tons of Tin per day. **Tin Plates.**—The Tin-Plate market has been sharing in the general dullness in metals, but, as stocks are light, and the markets abroad remain very firm, there is no giving way in prices. We quote,

large lines, ordinary brands, 3 box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.75; Ternae, \$4.12 @ \$4.30; Coke Tins, \$4.30 @ \$4.40, and Wasters \$4.15 @ \$4.20.

**Lead.**—Some 250 tons Common Domestic were sold at 3.67½¢, and 50 tons later on at 3½¢, the closing figure being 3.65¢, at which the market winds up languid, with hardly any disposition shown by consumers to stock up, as they have secured, it would seem, a sufficient supply to meet their next month's requirements. The West is flat at 3.40¢. At the Metal Exchange to-day 50 tons spot brought 3.65¢.

**Spelter.**—Has been quiet at 4.65¢ for Common Domestic, and Silesian at 5½¢ @ 5¼¢ nominally. The spring demand is evidently slow in coming forward. The metal is meanwhile devoid of features either way.

**Antimony.**—Has continued moving off steadily in a jobbing way at 12¢ Hallett and 13½¢ Cookson.

#### New York Metal Exchange.

The following sales are reported:

THURSDAY, April 18.	
10 tons Tin, May	20.65¢
WEDNESDAY, April 24.	
25 tons Tin, July	20.75¢
50 tons Tin, August	20.75¢
25 tons Tin, September	20.75¢

#### Coal Market.

The Anthracite Coal market is dull, with no alleviating features. The situation was the subject of a conference last week, with no further result than talk about advancing prices in June, but meanwhile circumstances bearing on the subject may naturally change. Cut rates among individual operators are quoted, and it is openly charged that prices are shaded by some of the larger companies. Production is still in excess of demands despite the efforts to restrict. The total exported for the week is 543,788 tons, against 506,662 for the previous week, and for the year since January 1, 8,391,700 tons, as compared with 9,809,700 for the same time last year. The official statement shows an output for March of 2,103,062 tons, as against 2,685,728 tons in the same month last year. Demands for manufacturing are on a lessened scale. Among recent contracts the following are reported: Supplies for the New York Board of Education, Talbot & Phillips, Staten Island Rapid Transit Road, Ward & Olyphant, Boston and Marine Railroad Company, Berwind-White Coal Mining Company. The West Point contract was awarded to Swords & Dickson at the following prices and discharge: Stove, \$4.28; Chestnut, \$4.23; Egg, \$4.03. The New Haven contract was divided between the Berwind-White Company, Pocahontas, Sterling Coal Company and J. C. Scott & Sons, at prices stated to be less than last year's.

There is a better inquiry for Coal at Eastern ports. The Connellsville, Pa., *Courier* says: "The Coke trade continues to fluctuate. Production and shipments still vary from week to week, but the general average is dropping slowly and steadily downward. Production for the past three months shows a steady decline. Shipments have fluctuated more, and the daily average for March is slightly in excess of that for February, though the production is *vice versa*. There does not seem to be any assurance of an improvement in the situation before fall, if then."

The Pennsylvania Railroad Company have begun the shipment of Coal from Harsimus Cove, opposite New York City.

The Delaware and Hudson Coal Company are to erect steam elevators on new docks building in deep water near Rondout Creek.

The Pennsylvania Railroad transported 200,000 tons of Coal during the week ended April 13, and the Reading reports 25,000 tons shipped to Port Richmond and Port Liberty during the week ended 20th inst.

##### EAST INDIES.

PENANG, March 5, 1889.—*Tin.*—Receipts for the fortnight amounted to 5500 piculs. Europeans bought 2000 piculs, for the most part from Chinese dealers, who, besides, secured 7000 piculs. The market rose from \$36 to \$37.25, in order to close at \$36.70. During the first two months shipments to England summed up 22,493 piculs, against respectively 53,725 and 21,643 the previous two years. To the Continent there have been no shipments, but to the United States they were respectively 3112, 425 and 5467. *Exchange*, 3/0%.—*Schmidt, Kustermann & Co.*

SINGAPORE, March 12, 1889.—*Tin.*—Since the 26th ult. business has been very restricted. Small arrivals and a falling market in London have resulted in but a small business being done. The market opened at \$36.50, advanced to \$37.25, but closes weak again at \$36.25, sellers, but no buyers. This month's export will be moderate, and it is expected that the arrivals for some time will be on a more limited scale than they have been of late. *Gum Copal.*—The daily arrivals have fetched good prices, but in old stocks, which are large, there has been nothing done. *Gum Damar.*—Palembang of low quality fetched \$20.50 per picul. *Tonnage.*—Still more room offers from China, and rates per steamer to London gave way to 35/ for dead weight. *New York via Cape.*—The Edward Kidder has arrived, and will take up her engagements. *For Boston.*—The berth is vacant. *Exchange* has declined to 3/1% for six months' sight credit drafts. The exportation of tin from the Straits Settlements to the United States during the first two months has been 22,230 piculs, against 9846 in 1888, 12,866 in 1887, 14,715 in 1886, 4205 in 1885 and 9841 in 1884. The Dardanus took hence for New York 842 piculs, the Gulf of Guinea 1262 from Singapore and the Shannon, from here, 2843.—*Gillilan, Wood & Co.*

MANILA, April 15, 1889.—*Hemp.*—Has been nominal at \$13.50 per picul, against same date last year \$8.44, equaling 3/ ton, cost and freight, \$45.12 1/2, against \$30.2/6. The clearances for the United States since January 1 amount to 105,000 bales, against 43,000 in 1888; there remain loading for ditto 11,000, against 24,000;

there cleared for England since January 1 85,000, against 100,000, while there remain loading 3000, against 1000. Cleared for all other ports, 11,000, against 24,000; receipts at all ports since last cable, 14,000 bales, against 19,000, and since January 1, 200,000 bales, against 176,000 last year and 132,000 in 1887. *Freight*, \$7.50, against \$5. *Exchange*, six months' sight, 3/7, against 3/8.—*Ker & Co., per cable direct to their agent, Mr. Charles Nordhavs, 89 Water street, New York.*

COLOMBO, March 7, 1889.—*Plumbago.*—Business has been limited to a moderate export demand at the following quotations in rupees per ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Shipments since October have been as follows: To England, 54,901 cwt.; to Hamburg, 5418; to Antwerp, 5101; to Bremen, 659; to Holland, 437; to India, 63; to Australia, 88, and to the United States, 58,580; together 125,247 cwt., against 114,527 in 1888, 102,284 in 1887 and 81,546 in 1886. *Coir Yarn.*—Nos. 1 to 4 have brought 7 @ 12 rupees per cwt. *Exchange*, six months' sight, 1/4%.—*Volkart Bros. to their agent, Mr. John W. Greene, 82 Wall street, New York.*

#### AUSTRALIA.

MELBOURNE, Victoria, March 28, 1889.—*Iron.*—Although buyers have been holding back somewhat, more has been done, the inland trade being brisk. No. 26 Galvanized Iron brought £17. 12/6; No. 8 Fence Wire, £8. 15/ *Tin.*—Shipments from Australia and Tasmania footed up 375 tons for the fortnight.—*Per cable via London.*

#### GERMANY.

HAMBURG, April 13, 1889.—*Iron.*—The demand for Pig Iron remains so brisk in Rhenish Westphalia, with appearances of permanency, that more blast furnaces are contemplated; it is to be hoped that this may not eventually lead to overproduction. Spiegel has continued active and steady at 68. Forge Pig is without difficulty bringing 56.50 marks per ton; orders have been booked to October 1. Foundry Pig is moderately active. Bessemer is least wanted, at 58 @ 59; English do., 48/ on the West Coast. Both Thomas and Luxembourg have been sustained. Finished Iron is all the brisker since to the great home demand some for export is now added. Beams, though selling very well, begin to be turned out at such a rate that a reaction may sooner or later be unavoidable. Both Plates and Sheets keep up the same degree of liveliness, though advanced in price. The Wire branch has not yet recovered last year's activity. Cast-Iron Pipe foundries have now come to an understanding, so that there is an end to the ruinously low figures. Steel Rails have been sold to the Roumanian railroads at 102 marks per ton, delivered at Galatz; at home they are bringing 120 @ 125. The Dortmund quotations for Beams are 125 @ 128; Mild Steel and Bessemer, 145; Wire Rods, 114 @ 120; Steel Rails for mines, 110 @ 115.—*Borsenhalle.*

#### BELGIUM.

BRUSSELS, April 13, 1889.—*Iron.*—Opinions are divided about the desirability, from a general point of view, of the suppression of the import duty on Pig Iron; hence it is as yet doubtful whether the measure will pass. The Government collected for such duty last year 437,145 francs. In the Finished-Iron trade orders are being received at such a rate that it may be decided to raise prices. A good many of these orders are for export. As matters stand, the general outlook in the Iron trade is decidedly encouraging, the spring trade having set in earlier and with greater vigor than usual, with indications that the demand will not abate much in the summer.—*Moniteur des Interets Matériels.*

#### British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, April 24, 1889.

The metal markets have been quiet during the past week, partly because of the Easter holidays and partly owing to the absence of incentive to speculation. Block Tin, which sold at as low as £91. 10/ last week under pressure to realize, has reacted about £1, and now that the pressure is withdrawn the market is firmer, although quiet.

A considerable amount of Copper has changed hands at declining prices, with as low as £36. 15/ taken for Merchant

**Bars.** The purchases were principally by large speculators, there being little business with consumers. Holders continue to gradually realize.

The demand for Tin Plate has been less active, and prices have shown a drooping tendency the past few days. Makers, however, are in expectation of large orders soon, and yield very little, in view of the strong Iron market.

Business in all branches of the Iron and Steel trade has been moderate, owing chiefly to the holidays, but is showing more spirit at the close. Prices for common Sheets have advanced 5/8 ton, and 2/8 advance is asked for Blooms, Billets and Slabs.

**Scotch Pig.**—Business moderate the greater part of the week, but more active to-day. Prices are somewhat irregular.

No. 1 Coltness, f.o.b. Glasgow	55/
No. 1 Summerlee, " "	55/9
No. 1 Gartsherrie, " "	52/8
No. 1 Langloan, " "	55/9
No. 1 Carnbroe, " "	47/8
No. 1 Shotts, " at Leith	52/8
No. 1 Glengarnock, " Ardrossan	52/
No. 1 Dalmellington, " "	45/
No. 1 Eglinton, " "	45/
Steamer freights, Glasgow to New York, 2/6;	
Liverpool to New York, 10/.	

**Cleveland Pig.**—Trade rather slow in this branch, but the market very firm. No. 8 Middlesborough, G.M.B., 39/ prompt.

**Bessemer Pig.**—Quite large sales since the holidays, and prices strong at 1/ advance. West Coast brands, mixed numbers, 50/, f.o.b. shipping point.

**Spiegeleisen.**—There is a fairly good demand and prices remain firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

**Steel Rails.**—The market continues strong and inquiries are more numerous. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—More demand for these and higher prices asked. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—The demand good. Makers offer sparingly and ask higher prices. Bessemer, 2½ x 2½ inch, £4. 10/, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Sales moderate but prices very firm and held higher. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—There is no improvement in the demand, and prices are nominal. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap Iron.**—Small sales making at previous prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Tin Plate.**—The demand is irregular. Prices are showing little change. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/9
IC Bessemer Steel, Coke finish	13/6 @ 14/
IC Siemens " "	14/ @ 14/6
IC Coke, B. V. grade	18/ @ 18/3
Charcoal Terne, Dean grade	12/ @ 12/6

**Manufactured Iron.**—The demand has been brisk and prices are strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
Common	8 17 6	8 17 6
Staff. Bl'k Sheet, singles	7 15 0	7 15 0
Welsh Bars (f.o.b. Wales)	5 2 6	5 5 6

**Crop Ends.**—The market firm but rather slow. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Copper.**—There has been a fair business. The market barely steady. To-day's prices for Bars were £86. 12/6, spot; £87, three-months' futures. Best Selected, £45.

**Tin.**—The demand for consumption fairly active and prices firmer. Straits sold at £92. 10/, spot, and £93. 5/ for three months' futures.

**Lead.**—More doing in this metal, but prices show no material change. Quoted £12. 15/ for Soft Spanish.

**Spelter.**—The demand only fair, but prices firm. Quoted at £17. 12/6 for ordinary Silesian.

On Tuesday 18 non-union colored men were about to go to work at the Allegheny Bessemer Steel Works, where a strike is in progress, but were intimidated by a display of pistols and induced to leave.

Important changes have taken place in the management of the Tennessee Coal, Iron and Railroad Company. Judge Bond, until recently connected with Decatur enterprises, has become general manager. Fred. W. Gordon has charge of the furnace properties and is now pushing the Ensley plant. H. Duncan Wood & Co. are the fiscal agents in New York. It is probable that influential New York capitalists will take a large interest in the concern, whose policy will be considerably modified. The first effort is to be in the direction of improving furnace work, bettering quality and marketing product in a more conservative manner. It is probable that the company will first endeavor to accumulate earnings to create a large working capital. It has been suggested also that the Linn Iron Works, at Birmingham, be transferred to Ensley, the real estate being very valuable.

The Philadelphia Company have made a series of meter tests to show the consumption of natural gas in puddling in the McSweeney regenerative furnace, as compared with that of the common puddling furnace:

Style of furnace.	No. of heats.	Material.		Gas used per 240 pounds of muck produced while actually working.	Gas used per 240 pounds of muck produced through whole time.
		Charged pig.	Produced muck.		
Common, A.....	55	27,500	27,085	34,109	
Common, A.....	30	15,000	15,031	23,618	
McSweeney's, I.....	55	27,500	27,525	14,829	19,079
McSweeney's, I.....	55	27,500	27,125	13,529	
Common, B.....	88		42,180	80,000	58,650
McSweeney's, J.....	85	28,400	28,129	15,952	21,535
McSweeney's, J.....	52	24,900	24,069	12,100	18,200
Common, C.....	55	28,875	28,725		26,958
McSweeney's, K.....	55	28,875	28,180	13,719	
McSweeney's, K.....	55	28,875	27,885		14,746
McSweeney's, K.....	55	28,875	27,980		13,561
Common, D.....	50	25,000	24,325	38,996	53,850
Common, E.....	27	20,250	20,765	24,450	35,216
Common, F.....	55	27,500	26,888	34,588	48,144
Common, G.....	47	25,500	23,480	87,372	40,811

The trials were made at different times between December, 1887, and March, 1888. The Philadelphia Company own the right to use the McSweeney furnace in Allegheny County and are offering the use of the devices to all their customers.

The National Tube Works Company, McKeesport, Pa., report that they have sold over \$8,000,000 worth of their kalamined pipe since the patents were issued. This pipe is used for a variety of purposes, principally water, oil and gas. There are 5900 men at present in the employ of the above company, and their works comprise 60 acres under cover. The

daily output is 1000 tons of finished product, including standard steam, gas and water pipe, boiler tubes, &c.

### Treasury Decisions.

The following decisions have been rendered by the Treasury Department under appeals from assessment of duties:

#### WHITE BRASS DUTIABLE AS A MANUFACTURE OF METAL.

Representations having been made to the Department that certain white metal or so-called white brass, in pigs, costing in England from £105 to £120 per ton, is classified as a metal unwrought not otherwise provided for at a duty of 20 per cent. ad valorem, decides that said substance, which is known as "Parsons No. — white metal," is not the white metal of commerce, but is composed principally of tin (60 per cent.) and zinc (38 per cent.), with traces of lead, copper and other metals, and that it should be classified as a manufacture of tin, zinc and other metal and subjected to a duty of 45 per cent. ad valorem.

#### DUTY ON CROCHET NEEDLES.

On an appeal from an assessment of duty at 45 per cent. on certain merchandise claimed to be dutiable at 25 per cent. ad valorem under the general provisions for needles, the Department says: "From an inspection it appears that the merchandise in question consists of what are commercially known as crochet needles, consisting of an iron wire frame with three needles of different sizes attached to the end thereof, so that they may be folded within the frame, and with an accompanying metal case capable of being adjusted as a shield for the three needles and of being used as a rigid handle for the needles. The articles are in fact and commercially known as crochet needles, and therefore the claim of the appellants is sustained."

#### DRAWBACK ON BUCK-THORN FENCING.

On the exportation of galvanized fencing manufactured by the Buck-Thorn Fence Company, of Trenton, N. J., wholly from imported steel and spelter, a drawback will be allowed equal in amount to the duty paid on the imported materials used in the manufacture less the legal retention of 10 per cent. The quantity of the materials so used will be ascertained as follows: Allow for each 100 pounds of the fencing known as "Buck-Thorn" 107.3 pounds of steel and 12.6 pounds of spelter, and of the fencing known as "Forms No. 1" and "No. 2" 95.1 pounds of steel and 12.6 pounds of spelter. The affidavits of the proprietor and foreman will state, in addition to the particulars required by the General Regulations, that the fencing entered for export, and specifically described therein as "Buck-Thorn," or "Form No. 1" or "Form No. 2," was manufactured in form, and from the materials described particularly in the sworn statement of said company, dated February 5, 1889.

Private cable advices report that J. B. Haggin, who controls the famous Anaconda Copper Mine, at Butte City, Mon., has left Paris for London. Mr. Haggin is credited with being the one most difficult to please in the copper negotiations at Paris, and his departure is interpreted as a sign unfavorable to a possible "deal."

Emerson & Midgley, of Beaver Falls, Pa., who have been at work for two years developing the manufacture of wire belting, have now carried it to a point where they are prepared to do work on a large scale. They have shipped the main wire belt to drive the American exhibit at the Paris Exposition.

# Hardware.

With a view to obtaining direct from the trade accurate and detailed advices in regard to the condition of business and the prospects for the present season, we addressed inquiries to Hardware merchants engaged in both wholesale and retail business and situated in places large and small and in all parts of the country, asking them to report to us frankly the state of trade and its outlook. To these inquiries we have received a multitude of replies and a mass of valuable matter bearing on this question, so that we are enabled to give an especially full and reliable report concerning the Hardware trade in the different States. Our information coming from jobbing houses and retailers at many different points in each State enables us to take a more accurate and comprehensive view than could otherwise be obtained of the conditions existing in the different localities and the feeling of the trade in regard to business. The synopsis and condensation of these reports given below will be of service to manufacturers and merchants, as enabling them to judge intelligently as to existing conditions, and to frame their business policy accordingly. It is not feasible in one issue to cover the entire country in this review of the market, which will be continued next week, with a special reference to the South and West.

Our acknowledgments are especially due to our correspondents who have so courteously and intelligently supplied the data for this article.

## Maine.

The partial failure of the crops last season is being seriously felt in many parts of the State, and Hardware, as well as business in general, is reported as only fair and in some places rather quiet since the 1st of January. The farmers are, however, feeling in good spirits and will increase the acreage of the crops over last year, and with the early spring and generally good prospects for the season are feeling encouraged. In nearly all parts of the State the prospects for building and repairing are excellent, and at some places an unusual number of new buildings are being projected. Most Hardwaremen are carrying only average stocks, which in some cases are smaller than usual on account of the uncertainty in regard to prices and the fact that, owing to the lack of money with the farmers, a heavy trade was not anticipated during the opening months of the year. From some interior points we are advised that the Interstate Commerce bill bears injuriously upon trade, as, having no direct water communication, they have to pay the railroads for the long haul. Collections from the farmers are reported slow but from Hardware merchants fair. A hopeful feeling pervades the reports from this State.

## New Hampshire.

A satisfactory condition of general business is reported, and Hardware generally is referred to as in good shape, with a good regular demand without special features. Well-assorted stocks are carried without special curtailment on account of uncertainty in regard to prices, and the outlook is regarded as favorable. Our advices in regard to the movement of building throughout the State are not as full as we could desire, but they indicate that there is a fair activity in this respect. The early spring has a favorable effect on business, and little complaint is made about

collections, though they are evidently rather sluggish.

## Vermont.

Our reports indicate that Hardware as well as business in general is somewhat dull, the condition of the roads in some parts of the State militating against an active trade. Stocks of Hardware are fair, and despite very low prices, which have a tendency to become lower, are purchased on the hand-to-mouth principle. Prospects generally for trade the next few months are good, with about the usual amount of building. Agricultural conditions are not satisfactory, there being some complaints of dry weather. Farmers as a rule are not disposed to buy beyond their absolute needs, and are slow in making payments, collections being thus unsatisfactory. One of our correspondents remarks that "good crops and better prices would improve trade very much. There's no end of things the farmer needs if he could only get money to buy with."

## Massachusetts.

The reports from this State are in the main satisfactory and indicate a good business during the season thus far, with very fair prospects for the summer. General business during the winter has been in the main about equal to former years, and the Hardware trade has been up to the average, being reported in many towns as good, although from some points the complaint is made that it has not started in with the opening of spring as vigorously as was expected. In many places there is an excellent prospect for building, but in some the question as to the hours of working introduces an element of uncertainty. Many additions to factories and the establishment of new manufacturing concerns are reported, and in some representative towns the prospect for building is referred to as never having been better, and in others as better than for several years past. Stocks of Hardware are fair to large, the condition of business justifying the keeping of good stocks, while the unsteady state of the market has prevented dealers from buying largely. Little complaint is made in regard to collections, which from some points are reported as very good and in others as rather slow. Farmers do not seem to have much ready money, the winter having been for them rather unfavorable.

## Rhode Island.

Most of the manufacturers are doing a fair business and making a large quantity of goods at small margins of profit. From Providence our reports indicate that February and March were quiet but that trade is now improving, and Hardware is moving in an average way but at low prices. Stocks throughout the State are not large, but well assorted, merchants being careful to avoid overstocking on account of their feeling that prices are not firm. It is gratifying to observe that from nearly all points our reports indicate a prospect for a fair amount of building and the expectation that trade for the season will be fair. Lack of promptness in collecting is to be noted.

## Connecticut.

During February and March trade was generally quiet, beginning to show increased activity with the advance of the season. From some points there are indications that with warmer weather there will be an improved business, but other merchants do not take so hopeful a view of the situation. There is a general recognition of the weakness of prices, and the tendency toward the coming together of manufacturers and consumers is referred to as embarrassing dealers and gradually reducing the margins. Comparatively few towns report as much building as usual, but from some there are

indications of more than the average. Collections have been slow but are improving, as the country trade is starting, but it is necessary for merchants to push them in order to keep them up to the mark. There are a number of new industries being started in several places which are stimulating local trade.

## New York.

Advices from the trade throughout the State indicate that there is about an average business in trade generally and that Hardware is similarly situated. Jobbing houses in the interior report a considerable volume of business, especially in heavy goods, in which the margins of profits are small, and also in seasonable goods, which are moving freely, while the trade on General Hardware are ordering sluggishly and are careful not to exceed their near requirements. In a number of places the indications point toward a good deal of building, and there is an apparent disposition on the part of those possessing means to put their money in real estate, and accordingly in many places the outlook for building is referred to as especially good, with the intimation that small and comparatively inexpensive houses will have a prominent place. Merchants are generally buying carefully and carrying as small stocks as possible, on account of their apprehension that lower prices may rule; and it is evident that stocks of Hardware are below rather than above the average. There is nothing discouraging in the outlook for the business of the next few months, and as the trade have been buying cautiously and are carrying light stocks it is anticipated that with fair crops a good business should be done. Nothing special in regard to collections is to be noted, there being some complaint, with the indications, however, pointing to about the ordinary conditions. From a representative wholesale house in Central New York we have an exceptionally full and satisfactory report, from which the following extracts will be of interest:

General business seems to be about the same as last year at this time, if anything a little duller, particularly the city trade. The Hardware business was better in January, poorer in February and better again in March than in 1888. Prospects for the immediate future are fair, and we see no reason to expect a much better or a much poorer trade than we had last year. Retailers' stocks are generally considered small, or at all events not above the average. In this city there is much building of small houses on loan-association funds, but no large contracts are made out. Collections are only fair. We take much paper, but our trade is generally solvent. The crop of last year was a fair one, but prices ruled so low that the farmers have little money to start this year with, and this will tend to restrict trade.

## New Jersey.

This State reports a steady and satisfactory trade, with the differences as to volume and tone which are to be expected in different localities. Building is generally referred to as active, most of our correspondents referring to their localities as likely to erect more than the usual number of buildings during the present season, and one of them remarks that this appears to be about the only way in which capital can be made use of. There is accordingly an improved demand for Building Hardware, in which line there is a fair activity. Stocks are about as usual, in most cases being kept up well, but the proximity to the markets justifies many of them in carrying comparatively small quantities of goods. While the general situation is thus satisfactory, it is evident that there is not much life in trade, and the low and uncertain prices have their effect in checking purchases, so that travelers in many cases report business as comparatively quiet. The disposition of manufacturers to deal direct with consumers is referred to as one of the annoyances with which the trade have to contend.

**Maryland.**

Our reports from this State are not as numerous and comprehensive as we could desire, but from those in hand it is evident that Hardware, as well as general business, is not in a satisfactory condition. Stocks of Hardware are apparently only adequate to requirements, no overstocking being perceptible. Prices are low, with no visible tendency to advance. Collections are only fair. We give the following advices from a prominent Baltimore house, which will be of interest as reflecting from their standpoint the condition of the market at large:

From all that we can learn as to business in general it is characterized throughout the country by a lack of activity, and where extra efforts are made to force trade and stimulate a demand for goods which does not naturally exist the cost attending such efforts is so great that the net profits are most unsatisfactory. We do not believe that the stocks throughout the country are in excess of its needs, but with the facilities of replenishing so easily when exhausted there is not the necessity nor the disposition for the trade to buy as largely as in former years. Regarding prices we can hardly believe it possible for lower figures to be reached than now prevail, except it be with such goods as are held in combination or pools. We believe that generally the condition of the agricultural section is as good financially as ever at this season of the year, which means that if the fruit escapes the frost, the wheat the rust, the corn the worm, the cotton the drought and the stock have grass enough, the farmer may be able to pay his store bills from the growing crops. Little money can be expected from the cotton States until next fall, though we suppose general collections are about as usual. We think for such goods in our line as may be considered necessities the demand will be fair, though economy may be shown in building.

**Pennsylvania.**

General business since the 1st of January is from nearly all points reported as fair, there having been in some sections a falling off within the last few weeks. Hardware is moving in fair volume, but there is no snap or activity in business. In the coal region trade is referred to as quiet. Stocks are generally well assorted and in a number of towns are reported as large, but there is no general disposition on the part of the trade to speculate, and owing to the unsettled condition of the markets goods only for immediate requirements are carried. Our correspondents generally refer to the downward tendency in prices. Agricultural conditions are favorable, the outlook for the growing crops being good, while it is, however, too early to predict confidently. Prices of country products have been exceedingly low, owing to overstocked markets, and the trade feels the effect. In nearly all parts of the State the prospects for building are, however, excellent, and from Philadelphia, Pittsburgh, Reading and other points this feature is referred to, with the intimation that it is better than for several years and that many dwellings and some fine business houses are in prospect of erection. There is a good deal of diversity in regard to the view of the trade as to collections, such points as Philadelphia and Pittsburgh reporting them fully up to the average, and with but little cause for complaint, while smaller points, where there is more direct contact with country trade, report them rather slow.

**Ohio.**

The reports from this State are gratifying, and it is evident that compared with the condition of things in other States Ohio has little reason for complaint. The volume of general business compares well with last year, but from some points it is referred to as rather quiet, with a certain feeling of depression. Most of our advices indicate that the Hardware business is satisfactory in volume, though perhaps showing some falling off from last year's figures. The large jobbers generally refer to trade as good, but reports from the

smaller jobbers are not quite so encouraging. The tone of the reports from retailers in different parts of the State is in general well represented in the following, which comes from Springfield, though, of course, in different localities there are special conditions affecting the situation:

In a general way trade has not been for the new year as large as was looked for, nor what it should be after the general slowness during 1888. The Hardware trade in particular is an exception. There has been a general increase since the opening of the year in sales and in confidence for the future. Small stocks, as a rule, are carried, and less buying ahead has been done than for some years. Prices are being better held than for some time by both jobbers and makers of goods with the exception of some few leading articles, such as Nails, Strap and T Hinges, Wire, &c. The prospect for trade for the months to follow is good. Shops are running full force. The farmer is in hard luck, with low prices for his product and an exceedingly small demand for what he brings to market. Collections are much better as a rule than for the same time a year ago, with more ready cash paid for goods.

While reports from other points are not in all respects as gratifying as the above, there is general agreement that the outlook is encouraging, our correspondents, with scarcely an exception, referring to the prospect for trade the next few months as promising. The amount of building throughout the State will evidently be up to the average, but the low prices ruling for farm produce will diminish building through the farming sections, but it is probable that the anticipated activity in towns and cities will more than make up for this. While there is some complaint in regard to collections as a little slow, and in some cases as decidedly so, it would appear that as a rule they are fully up to other years.

**Kentucky.**

Our advices from this State indicate that an excellent condition of things prevails, and there are some evidences of improvement over last year. General business is fair and the early spring has a stimulating effect upon it. Hardware is up to the average and there is at present a good demand for goods generally, but Iron is rather dull. The stocks in the hands of retailers are fair, but not heavy. There has been no buying of a speculative character for a long time and consequently stocks are light, but well assorted. Notwithstanding the good volume of business prices are low and this fact has the effect of deterring the trade from purchasing beyond their requirements. The prospect is regarded as good for a steady trade, with good prospects for building, as many dwellings, especially small dwellings and other buildings, are under contract. Collections are in rather better shape than usual. The crop prospects are regarded as excellent. With reference to general conditions a correspondent writes:

Competition for trade is closer than ever and profits much reduced. The year past has been one to make both manufacturers and jobbers scan expenses more closely, with a view to reducing the same.

**Michigan.**

During the early months of the year business was quiet and rather depressed, and with this condition Hardware naturally sympathized, but with the approach of spring there has been a marked improvement and our advices generally report a satisfactory business, to which, however, there are some exceptions, as other merchants refer not only to the trade of the past six months as having been the poorest in years, but also allude to the opening of spring as bringing only a slight improvement. Such reports, however, do not represent the general tone throughout the State, as many merchants are doing a good business, with stocks that are fairly well assorted and in some cases large, as the low prices induced free purchases. Farmers generally are without much

money, and the decline in wheat has a depressing effect. A good crop, which is indicated at the present time, will do much to induce a very satisfactory business. Stocks are fully up to the average and well assorted, and in some cases large, as travelers have been persistent and prices cut. A general tendency, however, to buy often and in small quantities is noted. The general downward tendency in prices is recognized. In some parts of the State the prospects for building are good, but in others there is little enterprise in this direction, and reports generally indicate that there will not be as much building as last year. The present indications point to a good season for agricultural products, as wheat came through the winter in excellent condition and looks promising, while the mild weather and early spring have an encouraging effect on the farming community. Few merchants report collections as good, most of them referring to them as slower than usual or only moderate. From a well-known house in Detroit, doing principally a retail business, we have the following:

Our trade is better this spring so far than it was last year or the year before, and we do not know of any reason why it should not continue. We are aware that the Hardware trade generally complains of dull trade. Stocks of Hardware, we believe, are generally small. We have bought largely this spring ourselves, as we consider the general lines good stock at prices which we think are down at bottom. Building prospects here are good and we consider the agricultural condition all right. Collections are about as good as usual, and we do not see why business for 1889 should not be better than any of the last three or four years.

**Indiana.**

General business is fairly active, but to a certain extent the partial failure of the wheat crop last year has affected it. The excellent prospect, however, for crops the present season induces a hopeful feeling, and there is little ground for complaint in regard to the volume of business. Most of our reports reflect a good condition in the Hardware trade, but it would appear that business is somewhat better in the Northern than the Southern part of the State. Several of our correspondents allude to their sales this spring as comparing well with those of last year. Full stocks are generally carried and well assorted, but the trade are buying carefully and in such quantities only as are required for their business, without much disposition to buy beyond their near requirements. Prospects for building are good, and it is probable that the amount of building will be somewhat above the average. Collections are only fair, but show some improvement during the last 30 days. Other points in regard to the condition of business are mentioned in the following careful review, which applies more or less accurately to conditions in the State generally:

Since January 1 business has been quiet, owing to the almost entire failure of the wheat crop last year and the low price of corn and cattle, and Hardware, in sympathy with other lines, is dull. The depression, however, does not seem to have affected the solvency of dealers to any extent. The stringency has had the effect with most dealers to reduce stocks, and as a consequence stocks are light though well assorted. The prospects for a fair summer and fall trade are good, and there are more buildings in progress and in contemplation than usual. The early spring weather has been favorable for the growing wheat, which now promises an abundant crop. The preparation of ground for corn-planting is well advanced and a large acreage will be put in. Tax-paying time is keeping back collections, which through the season have been fair. The general impression is that there is a strong conservative feeling existing among the Hardware trade of this vicinity, and they are carrying out this sentiment by buying often and in smaller quantities than usual.

Another correspondent writes:

Salesmen traveling in the Northern part of our State are generally having fair trade,

while in the Southern part they report trade quiet. Farmers are holding meetings to oppose the high price of Binder Twine, and frequently implicate local dealers as being instrumental in maintaining these prices.

#### Illinois.

The low price of produce and cattle has a certain depressing effect on the markets, and business in general does not vary much from last year's volume, and is reported by many merchants as being somewhat better, and some of them refer to the demand for Hardware as having been exceptionally good. There are, however, others who find it rather quiet, but this is not the general tone. Our correspondents, with scarcely an exception, refer to the prospect for the summer and fall as being very gratifying, and their anticipations are based on the general activity in business, the prospect of at least the average amount of building (the outlook for which is especially good in the large cities) and the expectation that the crops will, as at present indicated, be good, if not large. These conditions, together with the fact that retailers generally are carrying only moderate stocks, and are usually in good shape financially, though experiencing some difficulty in making prompt collections from their customers, induce a hopeful, if not confident, feeling. Chicago reports a very satisfactory business, and trade during the season has been active. As reflecting conditions in central Illinois we give the following synopsis of advices from a well-known jobbing house in the interior:

We have sold 30 per cent. more, according to the footings of our sales up to January 1, than during the same time last year. Stocks of Hardware are better than they were the first half of 1888, but the dealers generally have gotten so much into the habit of depending on the jobbers for supplies that there are no large stocks carried. Staples are sold on as close margins as we have ever known, but the profit on other goods is better than usual. The prospects for trade during the next few months are the best we have had in several years, and the outlook for building is excellent. We have a few chronic slow customers, but the balance of them seem to have money enough to meet their obligations.

#### Wisconsin.

Business in general in this State has been disappointing and lighter than usual. The condition of the Hardware business is not satisfactory, but in some sections of the State the prospects for the next few months are referred to as fair, while still others anticipate a trade exceeding that of last year or the year previous. Building prospects are only fair, though they are reported good from two or three points. Stocks are light and in some cases well assorted. Prices rule very low, owing to excessive competition, and are regarded by some of our correspondents as at bottom, which leads them to a hope that an advance may develop. The condition of the crops is generally referred to as unsatisfactory, leaving farmers with but little money, which injuriously affects trade and makes collections slow. Traveling salesmen report general sluggishness. We append a few extracts from the report of a well-known wholesale house:

The volume of business in this vicinity for the past eight months has been lighter than for 25 years during the same months. Hardware business has been even lighter than general business. Stocks in the hands of retail dealers are unusually light. Most staple articles are lower than ever known before. This is especially true of Iron and Nails and Barb Wire. Prospects of building are not flattering. No building of any consequence of the better class, houses erected being mostly of the cheaper kind. All through this neighborhood the hay and grain crop of 1887 was a failure and the grain crop for 1888 was light, very seriously affecting business and making collections very slow. Traveling salesmen say that business is light and must continue so until after a good general crop.

#### Iowa.

The tenor of reports from this State is satisfactory, indicating a fair to good business, with an excellent outlook. The

crops last year were good and promise well this year, the spring having been unusually favorable for agriculture and the prospect for large crops excellent. Indeed, one of our correspondents calls attention to the over-abundance of the crops in these terms:

In fact, we raise too much on an acre of ground in this State—too much corn, too much oats, too much potatoes, too much beef. All the above articles are sold too cheap. It takes about 7 pounds of beef to purchase 1 pound of Binder Twine.

The low prices thus ruling naturally affect business, but the volume of trade is evidently up to the average, as indicated by the following reports on this point, which are selected at random from those we have received:

The Hardware business is very good. A large demand for goods in this [Burlington] region. Very good during February and March, but light the first two weeks of April; but we now look for very nice business, recent rains having revived farmers' prospects. For three months ending April 1 not as satisfactory as desired, owing to very low prices ruling for farmers' produce of all kinds and the absence of rain. Since April 1 trade much improved; quiet, but looking up; healthy generally.

Stocks are kept up sufficiently to meet the wants of the trade, with no disposition to carry large stocks for speculation. They are generally reported well assorted but rather light. One of our correspondents alludes to the stocks of Hardware as not large but numerous, "that is, there are a great many stocks," with a very animated competition, which reduces profits to a minimum. It is not intimated that there will be more than an average number of new buildings erected, but with the existing agricultural conditions and hopeful feeling that prevails as to the business of the season, and if crops should turn out well, it is thought that a large business will result. Reports in regard to collections vary very much according to the locality and the idiosyncrasies of individuals, their general tenor being that they have improved since February and are fairly good, with a tendency still toward slowness. Travelers generally do not give as encouraging reports as merchants, a matter which is thus referred to by one of our correspondents whose judgment is entitled to weight: "Travelers generally report light sales. If, however, the sales of each one to the many dealers and the business of the many salesmen with the many dealers were aggregated, it would appear surprisingly different." The point is also made as promising well for the future of the State that immigrants are now more numerous than emigrants, while for some years past this has hardly been the case. This synopsis may appropriately be supplemented by the following report from a prominent jobbing house:

The condition of business generally at the present time is fair; some lines are doing better than others, though we hear of no complaints of dull trade from any source. The Hardware business is very brisk and has been for the past six weeks. The movement of heavy goods, such as Nails, Barb Wire, &c., has been lighter than at corresponding season of 1888, but sales of Shelf Hardware are larger. The stocks of Hardware in the country are not as heavy as usual at this season. Prices average lower than they have for years, and must be near bottom. The prospects for trade during the next few months are encouraging. The early spring and recent rains have created a feeling of hopefulness and confidence throughout this section. We do not look for unusual activity in building operations. Collections are quite satisfactory—better, in fact, than was anticipated at the commencement of the season. Our salesmen are keeping up their records of sales as in former years, and anticipate that the present year will be a very prosperous one.

#### Barb Wire.

The Eastern market supplied by this city is characterized by a gratifying activity, and a good deal of business is being done. To such an extent is this the case

that some of the manufacturers have difficulty in making as prompt shipments as they desire. Prices are without change, on the basis of 3.5 cents for carload lots, 3.6 cents for 3-ton lots, and 3.8 cents for smaller parcels, with deliveries as usual.

An article has appeared in some of the Western papers intimating that some of the Barb Wire manufacturers of St. Louis were intending to close down their works owing to the condition of the market and the disadvantages in freight discriminations under which they are laboring. It has also been stated that a circular has been issued by the Freeman Wire Company suggesting this. But we are authorized to deny this report so far as the Freeman Wire Company are concerned, and are advised that the company have not directly or indirectly issued a circular suggesting this cessation of operations, and that it is not their purpose to close their works, the only foundation for such a report being their intention of remodeling and readjusting their Wire mill, which, as a matter of fact, would require only a slight suspension of business, possibly for from three to five weeks.

#### Cut Nails.

Quite a considerable volume of business is being done, with quotations remaining at \$1.80 to \$1.85 for carload lots on dock. It is reported that all but three signatures have been secured to the pool plan excepting one leading mill in Central Pennsylvania, which declined to enter from the start.

#### Miscellaneous Prices.

The Standard Fiber Ware Company, Mankato, Minn., and 105 Lake street, Chicago, Ill., quote their Flax Fiber-Ware at the following prices, which relate, it will be observed, to both decorated and plain:

#### Flax Fiber-Ware.

	Plain.	Decorated.
Water Pails, 12-quart.	\$4.00	\$4.50
Dairy Pails, 14-quart.	4.50	5.00
Fire Pails, No. 1, 12-quart, No. 2, 14-quart.	4.50	5.00
Sugar Pails (with cover).	6.00	6.50
Chamber Pails, No. 1, 12-quart; No. 5, 14-quart.	6.50	7.50
Slop Pails, No. 1, 12-quart; No. 5, 14-quart.	6.50	7.50
Commode Pails, No. 1, 12-quart, No. 5, 14-quart.	6.50	7.50
Slop Jars (balance trap).	8.00	9.00
Commode Rings.	1.50	1.50
Wash-Basins, 10 1/4-inch.	2.00	2.25
Wash-Basins, 12-inch.	2.25	2.75
Wash-Basins, 13 1/4-inch.	2.75	3.25
Wash-Basins, 15-inch.	3.25	3.75
Fruit Bowls.	2.50	2.50
Servers, 12-inch.	2.00	2.00
Keelers, 11 1/4-inch.	4.00	4.00
Waste Paper Baskets, 13 inches high.	6.00	6.00
Mats, 9 inches (for table use).	1.00	1.25
Mats, 15 inches (for Cuspidors, &c.).	3.00	3.50
Mats, 17 inches (for Slop Jars, Spittoons, &c.).	3.50	4.00
Mats, 20 inches (for Slop Jars, Spittoons, &c.).	4.00	4.50
Cuspidors.	8.00	8.00
Cuspidors and 15-inch Mat, combined.	11.00	11.00
Spittoons, Daisy, 8-inch.	4.00	4.50
Spittoons, 10 and 11 inch.	6.00	6.50
Peck Measure.	4.00	4.00
Half-Peck Measure.	3.50	3.50

The following revised prices of Lead Pipe, Sheet Lead, Block Tin Pipe, &c., are announced under date April 22:

	Per pound.
Lead Pipe.	5 1/2¢
Sheet Lead.	6 1/2¢
Tin Lined Lead Pipe.	15¢
Block Tin Pipe.	45¢

It has been known for some time that the prices of Hot-Pressed Nuts have been more or less irregular, and concessions have been made beyond the prices agreed upon by the manufacturers. This has led to the giving up of the association on these goods, and the makers are now free to sell at such prices as they desire, untrammelled by combination. It is, however, to be noted that the prices ruling are about those at which the goods have been selling,

and that the present condition of things has not resulted in inducing materially lower quotations. It is to be borne in mind that Cold-Pressed Nuts, on the other hand, are in excellent condition, the agreement between the manufacturers being well maintained. A reduction of  $\frac{1}{10}$  cent per pound has been made, in sympathy with the reduced cost of the raw material, but the new prices are referred to as firmly held.

Walbridge & Co., Buffalo, N. Y., issue an interesting catalogue of their iron Reservoir Vases, which, besides giving illustrations of this well-known line, represent also Lawn Chairs, Settees and some staple Hardware. The line of Vases is exceptionally complete, including small and inexpensive ones, as well as those of more artistic pattern and more imposing dimensions. Illustrations, with a full statement of measurements, are given of the different patterns, together with list prices. One of these patterns is, it will be observed, shown in their advertisement on page 55, in which some further particulars are given in regard to the goods. The description given in the catalogue of the construction of these Vases, and the manner in which they are supplied with water, is clear and interesting. The new styles of Vases shown are especially worthy the attention of the trade. The discount sheet relating to these goods is as follows:—

	Discount.
Vases.....	30 %
Settees.....	30 %
Globe Lawn Sprinklers.....	40 %
Lawn Sprinklers Nos. 10 and 50.....	50 %
Prize Hose Reels.....	60 %
Philadelphia Mowers.....	60 %
Stable Fixtures.....	40 %

Van Wagoner & Williams Company, 82 Beekman street, New York, have issued a new catalogue showing their well-known line with recent additions. The new goods are especially in the line of Wire Coat, Hat and other Hooks. It is to be noted that the convenience of the trade is consulted in making the Real Bronze Spring Hinges subject to discount, the same as the other styles, instead of having them net, as heretofore. We shall have occasion again to refer to some of the new goods. The following is the discount sheet of the company:

	Discount.
Basin Wrenches.....	40 %
Bed Keys.....	15 %
Blind Adjusters, Domestic.....	33 $\frac{1}{2}$ %
Unique.....	33 $\frac{1}{2}$ %
Bolts, Doen's.....	70 & 10 %

### Obituary.

William L. Humason, president of the Humason & Beckley Mfg. Company, New Britain, Conn., who are well known as Hardware manufacturers, died at his home in New Britain on the 15th inst. Mr. Humason was born in Simsbury in 1821 and went to New Britain in 1851, where he engaged in business, and in 1864 established, with others, the company with which he has since been identified. At a meeting of the directors of this company, held on the 19th inst., the following resolution was adopted:

*Whereas*, It has pleased Almighty God in His providence to remove from our midst our friend and counselor, William L. Humason, the founder and president of this company; be it

*Resolved*, That we sincerely mourn our loss; that we honor his memory; that we honor him for his many noble qualities; that we acknowledge it was through his wisdom, skill and guidance, his unswerving integrity and ability, that this company has been brought from a small beginning to its present standing among the manufacturing interests of the country.

The death of Nelson Sawyer, senior member of the firm of Sawyer Brothers, of Columbus, Wis., is announced. For upward of a year and a half Mr. Sawyer had been in failing health, but not until about ten weeks before his death was he obliged to remain at home. He was born in Wendell, Mass., in 1833. In 1853 he went to Wisconsin and entered the employ of Spencer & Buxton, then the leading blacksmithing firm and jobbers in Columbus. Upon the death, not long after, of Mr. Spencer he became a partner. On the 1st of April, 1867, he associated himself with his brother Lewis J., then the proprietor of a Hardware establishment in Columbus, and a successful business was carried on for the following 22 years. He is referred to as a man possessed of noble qualities, generous impulses, energy and excellent business qualifications.

### Hardware in the Centennial Celebration.

In the absence from the city of the president of the Hardware Board of Trade, Edward H. Cole, secretary, will represent the organization at the centennial parade May 1. The body of men already accepted for the industrial parade numbers some 110,000, and the procession will require 17 hours, it is estimated, to pass a given point, unless arrangements which are under advisement are carried out to diminish the number, or consolidate the parade in such a way as to facilitate its progress. It is thus obvious that the necessity of the case calls for a reduction rather than an increase in the number of those participating in it, and under these circumstances it is manifestly impossible that the boards of trade of the city, of which there are more than 100, should take part except through individual representatives. General Butterfield has accordingly invited the boards of trade and other organizations of like character to be represented and participate in the parade in simply a formal manner, and under this invitation Mr. Cole has, as above stated, been appointed to represent the Hardware interests. General Butterfield will name the delegated representative as an aide, and the aides so named will be assembled at a given point uptown on the morning of the parade, where they will be provided with a sash as the badge of office. When the procession arrives at that point it will be halted and the representatives or delegates will precede the column in passing the President, and after marching past the President will take seats reserved especially for them on the grand stand south of the President. A committee will prepare a brief address to be engrossed upon parchment and inclosed in a silver case. This address will be signed by all representatives of the societies

of a civil, industrial and business character and be presented to the President. The united delegates will also provide a gold medal, a silver medal, and banners to be offered as prizes or awards to the civil or industrial organizations in the parade which shall be decided by competent judges to have best complied with the rules made necessary to make the parade a success, together with making the most agreeable and effective display. The gold medal will be awarded to the first, the silver medal to the second, and the banners to the third, fourth, fifth and sixth. The decision in this award will be made by 50 or 100 men who will be stationed at different points along the line of march.

### Items.

Horton, Gilmore, McWilliams & Co., of Chicago, recently effected a sale of Hardware under rather peculiar conditions. The bill of goods is quite large, covering a very general assortment, its destination is California, and it will be shipped from New York via Cape Horn. It is believed to be the first case on record of a shipment of goods from a Chicago Hardware house to California "around the Horn."

W. H. Keeler, Buffalo, N. Y., has issued a catalogue explaining his patent Printing Wheels, which are on the market to take the place of Stencils. They are referred to as printing perfectly and rapidly with a neat and business-like effect, and are designed especially for putting the name and business of the merchant prominently before the public on boxes, wrapping paper, packages, bags, &c. A large number of sample impressions are given, showing the kind of work done by the Printing Wheel and indicating the variety of its adaptations.

Fayette R. Plumb, Philadelphia, Pa., has issued Supplement No. 1 to his catalogue of 1888. It is printed in the same elegant style as his catalogue and represents a line of Picks, Mattocks, Grub Hoes, Pick-Eyes and Striking Hammers. In his introduction he refers to the necessity of engaging in the manufacture of this line of goods in order to complete his line, and states that he succeeded a few months since in closing negotiations with the proprietors of the Washoe Tool Company, thereby becoming sole owner of their entire plant. New shops have been erected with improved equipment, thus giving him an exceptionally large capacity for the production of these goods. It is intended to make these Tools of the best material, and in addition to the regular line some of the leading goods are made from solid cast steel. It is stated that these goods will be manufactured from a soft steel for welding properties equal to the best refined iron, and that the points will be made from best tool steel and contain double the amount of stock ordinarily used for this purpose. They will be ground perfectly clean, finished in oil, and care will be taken in each department to see that they are perfect. The two leading patterns of Drilling or Striking Hammers, made from a high grade of tool steel, are also presented.

The Paddock-Hawley Iron Company, St. Louis, Mo., have issued a new catalogue and price list. It is a compactly arranged volume of 660 pages, which are well utilized in illustrating the variety of goods they are handling as manufacturers, agents, importers and merchants. After a full and satisfactory index the volume opens with Iron, Steel, Plow Shapes, Corrugated Iron, Spikes, Bolts, Nails, Horse-shoes, Anvils, Vises, Forges, Drills, Tire Benders, &c., and a large variety of tools and supplies for blacksmiths and machinists. Wagon Hardware occupies an important part of the catalogue and is represented in large variety; Lamps, Gears,

Bodies, Wagon Woodwork, &c., are appropriately shown. List prices are given throughout, the lists being the standard ones for the most part. The volume closes with interesting tables of estimated weights, and other useful information in regard to Wire Gauges, weight of metals, number of Spikes required, tempering steel, &c. It is a very creditable volume, which will be appreciated by the trade.

The Pike Mfg. Company, Pike Station, N. H., have issued a very convenient catalogue and price list for the present year, and call attention to the fact that they have added to their line since issuing their last number. The catalogue is fully illustrated, cuts being given of the different brands and qualities of Scythe, Axe and other Stones. A new and interesting feature,

### Edward B. Mead.

The death of Edward B. Mead on the 1st inst., at his home in Brooklyn, N. Y., removed one who had occupied a prominent place among Hardware merchants and who was widely known and held in high esteem. His connection with the Hardware business extended nearly as far back as that of any of the Hardwaremen of the present day, and a retrospect of his business career recalls times which are beyond the recollection of the great majority of those who are now actively connected with business life, and conditions which are very different from those now existing. At the time of his first connection with the Hardware business probably not more than 7½ per cent. of the goods sold in the United States were of

position in the store of the well-known house of William N. Seymour & Co., Chatham square, and through his influence a position was secured for him with Henry A. Beach, a broker, in whose employ he continued for some three years. In 1840 he obtained a position as clerk in the Hardware commission house of Woods & Wheelwright, 11 Platt street, his first connection with the trade in which his life was spent. On their giving up business he returned to his home in Delaware County, where, however, he remained only a short time, returning to New York in 1843, where a position had also been secured for him by his brother Andrew in the house of George Briggs & Co., commission Hardware merchants, 115 Maiden lane, with whom he continued after their removal in 1846 to No. 9 Platt

EDWARD B. MEAD.

Born 1821; died 1889.

the convenience of which will be appreciated by the trade, is the fact that under Arkansas, Washita and other Oil Stones different assortments are given. The cuts of unusual Stones, such as Knife Blade, Triangular File Piece, Needle Piece and others, as well as the more regular goods, are of interest.

The Sullivan Hardware Company, Anderson, S. C., is referred to as one of the leading concerns in Anderson, in an article published in the *Greenville Daily News* of recent date, in which the business position and enterprise of the city are extolled.

Packard & Co., Greenville, Pa., issue a special Gun catalogue, in which a variety of Breech-Loading Double Guns are shown, together with Muzzle-Loaders, Flobert and other Rifles, and attention is called to Gun Implements, Reloading Tools, Ammunition, &c.

American manufacture, the great bulk of them being imported from England and Germany, while at the present time the amount of imported goods sold is insignificant compared with those of domestic manufacture. It is also interesting to note that the houses with which Mr. Mead formed his earliest connections were identified with the interests of American manufacturers, and that the large concern of which he was for many years a partner exercised an important influence in the development of domestic production of Hardware.

Edward B. Mead was born in 1821 in Walton, Delaware Co., New York, and when in his sixteenth year he left home, coming down the Delaware River on a raft to Trenton, N. J. He remained in Trenton, however, but a short time when he was led to come to this city through the influence of his brother, Andrew J. Mead, who was already here occupying a

street. It is interesting to observe that George Briggs was one of the first manufacturers in this country of Steel Squares, and the veritable sign bearing his name was for many years carefully preserved by Charles Bliven, who at the time of young Mead's connection with the house was the partner of Mr. Briggs. These two persons who in later years were to be long and prominently associated together as manufacturers and merchants thus met for the first time. After a short time Mr. Mead obtained an interest in the business, the style of the firm still continuing George Briggs & Co., and in 1848, on the retirement of Mr. Briggs, who went into politics, the firm became Bliven & Mead, with Mr. Briggs as a special partner. Mr. Mead was married in 1850 and his widow survives him, as does also his brother, Andrew J., and three sisters. In 1857 the business was moved from 115 Maiden lane to 243 and 245 Pearl street.

and 18 and 20 Cliff street, the junior partners, Bliven & Mead, having purchased the interest of Mr. Briggs. The business of the firm was carried on in this location until 1877, during which time it was largely extended, the house becoming one of the most prominent in the country. The first year of the war was a trying one for the Hardware trade, and many old houses came to grief by reason of the depression in business, and in some cases by the loss of balances due them from customers in the South. The firm of Bliven & Mead, however, weathered the storm and were enabled to take advantage of the activity and business prosperity that soon ensued.

In 1854 Bliven & Mead were the New York agents for the Hart Mfg. Company, of which J. T. Hart, who had been manufacturing Hardware since 1838, was president, and in 1866 sold their business to the Hart Mfg. Company, Mr. Bliven becoming president. The business was conducted under this name until 1873, when the style was changed to the Hart, Bliven & Mead Mfg. Company, and in 1878 the business was removed from the old location in Pearl and Cliff streets to 107 Chambers street and 91 Reade street, thus following the course of the movement of the Hardware trade in this city. The company continued prosperous until overtaken by the hard times and depression of trade which were so trying to business houses, and its sales in some years exceeded \$1,500,000, ranking it among the largest Hardware houses in the country. When in the year 1878 the company were overtaken by financial difficulties and were forced to make an assignment Mr. Mead was unanimously chosen assignee to settle up the business, a task of some delicacy and difficulty owing to its manifold complications, which, however, was performed with painstaking fidelity and marked ability and to the general satisfaction of all concerned. When this was accomplished Mr. Mead was free to accept another engagement, and went to Chicago in the employ of Hibbard, Spencer & Bartlett, taking charge of their credits. The climate, however, did not agree with Mr. Mead or Mrs. Mead, and, notwithstanding the consideration in which he was held, Mr. Mead, from the strength of his associations in this city, was unable to feel contented in his new home, and after a comparatively short time returned to New York and became connected with the American Screw Company as their representative in this city, a position which he held until failing health compelled him to relinquish all business cares. During the greater part of his life he enjoyed robust health, but for more than a year previous to his death he was confined to his house by illness, so that when the end came it was not unexpected. At different periods in his life Mr. Mead occupied other positions of trust and responsibility, and among them may be mentioned his connection with the Branford Lock Works, for whom as early as 1865 Bliven & Mead were agents, and of whose board of directors Mr. Mead for the greater part of the time since that date was a member.

As a business man Mr. Mead is referred to by those who knew him best as having been thorough and indefatigable, with an exceptional capacity for accomplishing work, and as especially diligent and painstaking where the interests of other persons were involved. The greater part of his life was closely applied to business activities, and he rarely took a vacation except an annual visit to his home in Walton, where he indulged his favorite recreation of trout-fishing and tasted the pleasures of angling, to which he was an enthusiastic devotee. During his protracted sickness, which lasted nearly a year, the thought of this recreation of his boyhood and mature life was refreshing to

him, and he fancied that if he could again visit the streams which he knew so well it would be the means of restoring him to health. The cordial and genial bearing of Mr. Mead are well known by all who have been brought in contact with him, and notwithstanding the cares and perplexities of his life his geniality and cheerfulness never failed him, and there was about him even in his advanced years much of the vivacity, kindliness and buoyancy of youth. These and other personal qualities and the unquestioned integrity of his character gave him many friends in the trade, by whom he was held in high esteem and who received the tidings of his death with a sincere personal sorrow.

#### Items.

Yawman & Erbe, Rochester, N. Y., have issued a circular relating to their Elevator Floor Stop and Lock, of which illustrations are given showing its special features and advantages, with a detailed description of the Lock.

The trade will be interested to learn that at the Melbourne exhibition, in the department devoted to Cutlery, Hardware and Iron-mongery, John Chatillon & Sons, 89 Cliff street, New York, were awarded the first order of merit on Spring Balances. We are also advised that the goods that thus received the highest commendation were the regular goods of the manufacturers as exhibited by their agent and were not specially prepared for the exhibition.

Stafford & Rix, Keokuk, Iowa, the well-known wholesale Hardware and Iron House, have sold their entire stock of Shelf and Heavy Hardware, Iron and Wagon Stock to A. Weber & Co., of that city, to whom they refer as their neighbors in the Hardware business and commend them as courteous, efficient business men, every way reliable. They further call attention to the fact that the trade will thus be offered a stock of goods second to none in the Mississippi Valley. They also in taking this leave of the Hardware trade of Iowa, Missouri and Illinois extend thanks to their customers for the long-continued patronage bestowed upon them, and invite a continuance of it to their successors. We understand that in thus disposing of their Hardware business they intend to engage in the banking business in Chattanooga, Tenn., and in this new departure will have the best wishes of their many friends in the trade, who will regret their withdrawal from the Hardware field.

Tucker & Cox, 230 Market street, Philadelphia, Pa., issue a four-page price list of Steel Stamps and Dies, in which specimens of their letters are given, with prices of their Steel Letters and Figures in sets. Their Burning Brands for the use of builders and others are also represented.

H. L. Waterman, Mills Building, New York, has been appointed agent for the Hartman Steel Company, Carnegie, Phipps & Co., Beaver Falls, Pa., for Wire Nails, Copper Wire, &c.

In our issue of February 14 a description was given of the B. M. T. Saw, devised by Warren Bundy, Minnesota City, Minn., and manufactured by the Montague-Woodrough Saw Company, Chicago, Ill., with special reference to the form of the teeth. We are advised, however, that the principle on which the teeth are constructed and arranged is not entirely new, as per the following letter from prominent Saw manufacturers:

Upon referring to some of our old papers we find that Saws made with similar teeth were made by us 30 to 35 years ago, and ever since then on the same principle. We are led to write from the fact of this being presented as something new, whereas such is not the case, for in making further search we find patents of recent date, 1877 and 1881, in which teeth were made as represented in your paper. If you

could take the time to look over the Saw catalogues you would find the principle of arranging two beveled teeth and one oiseaued tooth in groups to be nothing new, having been used by different Saw-makers in this country for several years. We do not wish to be considered in the light of finding fault with our competitors for introducing what they suppose to be new devices for Hand-Saw teeth, but, being Hand-Saw manufacturers, our objection is to its being brought forward as a recent improvement.

The White Mountain Freezer Company, Nashua, N. H., issue a striking and attractive show-card designed to call attention to their line of Freezers. It is entitled "Jack Frost and His Bride," and the Triple-Motion White Mountain Ice-Cream Freezer is prominently introduced. They have also prepared a pretty lithographed card, which is furnished to the trade in any quantity desired, with their imprint on the back. Their catalogue is neatly printed, and illustrates the large variety of Freezers they make. Their New York office is 99 Chambers street, W. H. Quinn & Co. being their agents.

The Ross & Fuller Association, 83 Chambers street, New York, have been appointed exclusive agents for the sale of the Perfection Inside-Edge Stove-Pipe Elbow, manufactured by the Detroit Elbow Company, Detroit, Mich., on which they are now prepared to quote prices.

A paragraph has been going the round of the papers to the effect that a new enterprise with a capital of something like \$1,000,000 is being established at Cleveland, Ohio, for the manufacture of Screws. Inquiry develops the fact that the rumor is, however, entirely without foundation.

On page 81 our readers will observe the advertisement of C. H. Taisey, Denver, Col., in which Blood's Patent Adjustable Hose-Holder is illustrated. The points made in regard to this Holder are its durability and portability, and the fact that it will accommodate any size of Hose and in any desired position for watering purposes. The Holders are 30 inches high and are made of iron japanned, galvanized or nickel-plated, and also of polished brass. It will be understood that the legs screw into the Holder, thus permitting it to be taken apart readily, and at the end of the season laid away in small space.

Johnson & Colton, Montpelier, Vt., in their price list No. 6 describe the line of Saddlery Hardware of which they are manufacturers. They call special attention to the Colton Patent Buckle, which is made to prevent the mane or tail of a horse from catching on the point of the tongue, as it often does where a common Buckle is used. The metallic Check-Rein Loop is also specially referred to as cheaper and more durable than any made from leather.

Biddle Hardware Company, Philadelphia, Pa., have issued a circular of seasonable goods, representing Lawn Mowers, Hoes, Steel Goods, Scythes, Cultivators, Saddlery Hardware, Spring Hinges, Freezers, &c. It calls attention also to the manufacturers for whom they are agents or representatives.

John Moore, 53, 57 and 59 Warren street, New York, issues a neat pamphlet, with price list of leading styles of harness, calling attention also to horse blankets, horse clothing, &c.

C. W. Packer, 20 N. Fourth street, Philadelphia, has issued a neat and convenient price list of his Standard, Expert and Model Ice-Cream Freezers. His Confectioner's Machine Freezer is also illustrated. A brief description is given of the special features of this machine and the points made in regard to them, with some standard recipes and directions for freezing.

### Handle for Milk-Can Covers.

Berger Bros., of No. 237 Arch street, Philadelphia, Pa., have placed upon the market a convenient handle for milk-can covers, a general view of which is presented herewith. The device consists of two galvanized castings, riveted together in such a way that the top or cap of the handle will revolve, while the lower portion, which is fastened to the can cover, is stationary. This permits the milk can to be rolled along upon the rim of the bottom while the operator firmly grasps the top of the patent cover handle. This is a matter of great convenience and is claimed

Seal's Handle for Milk-Can Covers.

to facilitate the loading and unloading of milk cans. The device is made under Seal's patent, and is said to be the only revolving handle made.

### The New Barb Wire.

The accompanying illustration represents a two-point barb wire called the Texas barb, which is put on the market by the Iowa Barb Wire Company, 98 Reade street, New York. The special feature of this wire is that the barb is flattened one-half, with the result of saving one-third the weight of the barb, or about 10 per cent. of the total weight of the barb wire. The company advise us that tests made show that their wire has a special strength, and it is obvious that the strength is not affected by the size of wire used for the barbs, so that there is a clear saving in

Texas Barb Wire.

weight resulting from the use of Texas barb. The price for this wire will be 10 cents per 100 pounds extra, which they refer to as representing about one-third of the gain to the consumer in weight as compared with other barbs.

### Safety Can for Gasoline.

In the accompanying engravings we show an automatic safety can which is being supplied to the trade by George M. Clark & Co., of Chicago, Ill., and is known under the name of Jewel. This can is provided with a malleable-iron head or nozzle which cannot be dented or pressed out of shape, rendering it very durable. It is constructed with a double pitcher-shaped outlet, which permits of its use by either right or left handed persons. Referring to Fig. 1 of the engravings, A is a valve or stopper which is held firmly to its seat by a strong spring, a general view of which is shown in Fig. 2. The construction of this valve is such as to practically make a close ball-joint, being easily opened for use and which instantly closes when released from the hand. The stopper being below the upper part of the nozzle, is

fully protected from disturbance should the can by accident fall to the floor or come in contact with any object. A guard

Safety Can for Gasoline.—Fig. 1.—General View of Can.

placed within the can prevents the stopper being drawn up too far and straining the spring. This spring is made of steel

Fig. 2.—View of Valve and Spring.

wire, spiral in form and satisfactory in operation. The valve is made of hard brass, and is automatic and self-adjusting in its action. This can is protected with a wooden bottom provided with slots cut

### New Freezers.

The Gooch Freezer Company, Cincinnati, Ohio, are placing on the market this season the Zero, the Pet and the Boss Ice-Cream Freezers, which are referred to as

Fig. 1.

well finished and made of the same material as their well-known Peerless, which has been on the market for the past 18 years. The Zero, Fig. 1, is a full-sized freezer, and the dasher has a self-adjusting scraper to remove the cream from the side

Fig. 2.

of the can, and the freezer will operate with or without the dasher, as desired. It is an easy adjustment and well made. The Pet is represented in Fig. 2, and is, it will be seen, slightly different in construction. It has also a self-adjusting scraper. The Boss, Fig. 3, is described as a solid, well-

Fig. 3.

made freezer to meet the demand for a very cheap article and is full size, with self-adjusting scraper to cut the cream from the side of the can. All the above freezers are made in 2, 3, 4 and 6 quart sizes.

### The Smith Premier Type-Writer.

One of the latest candidates for public favor in the shape of a type-writing machine is that manufactured and offered to the trade by the Smith Premier Type-Writer Company, of Syracuse, N. Y. This

operated. This is somewhat different from that employed upon the Remington or Caligraph, and consists essentially of a rocking instead of a lever motion. In the engraving 1 is the key with stem, 2 is the rocking shaft, 3 is the connecting rod or wire, and 4 is the type bar. The manu-

carriage is gibbed solidly to the machine, and cannot be raised, as is the case with other type-writers at present on the market. The platen, with its paper-feeding mechanism, which is shown detached in Fig. 5, is mounted upon an auxiliary frame, or cradle, which in turn is carried on the carriage frame, and may be instantly detached from the machine by drawing up the lever shown at the left in Fig. 1 of the illustrations. This enables the operator to remove the platen, with its paper, and to instantly substitute another. The advantage of this arrangement will be readily appreciated by those who desire to change from ordinary work to that of manifolding, and do not wish to remove the paper from the platen. Another feature to which attention is directed is the locking mechanism, by means of which, when the alarm bell rings at five letters from the end of the line, the same as in other type-writers, this machine will print five letters or characters and lock the entire system of keys, so that no additional impressions can be made. This prevents blurring the last word by striking several letters one upon the other, as frequently happens in the use of machines at present well known to the public. The lever for drawing the carriage back from each line of printing projects forward and downward, as indicated at the right in Fig. 1. This lever is attached to a rock-shaft, which extends backward and is neatly incased in the carriage frame. At the opposite end

The Smith Premier Type-Writer.—Fig. 1.—General View of Machine with Platen Drawn Forward to Show the Writing.

machine represents the results of a great deal of study and experimentation, and, we are informed, is built to meet all the requirements of a first-class machine. The manufacturers state that it is thoroughly made of the best materials and finished in the highest style of the art. In the accompanying engravings we present a number

facturers point out that the use of this device enables the upper-case, or capital-letter, keys to be arranged in a manner to exactly duplicate the lower-case, or small-letter, keys, and also to use steel in the place of wood. Every key of the machine is said to have the same leverage as every other key, which is claimed to be the only ar-

Fig. 2.—The Keyboard.

Fig. 3.—Type-Operating Mechanism.

of views which, in connection with the following description, will enable the reader to form a very comprehensive idea of the principal features of construction.

In Fig. 1 is shown a general view of the machine, with the platen drawn forward for the purpose of inspecting what has been written. Fig. 2 represents the keyboard employed on this machine. It will be noticed that there are 78 character keys, arranged in straight rows in all directions, and that the shape of the key-board is a rectangle. The lower-case keys are white, while the upper-case letter, numeral and character keys are black. The upper and lower case letters are arranged in the same order, thus facilitating the work and relieving the mind of search for the required character. It will also be noticed that this key-board possesses two space-keys instead of one. The tips of the keys are celluloid and are screwed upon a steel disk, which is riveted to a steel stem. The characters are inlaid in the keys, and are claimed to be thoroughly durable. In Fig. 3 of the engravings is presented the mechanism by which the type is

arrangement yet known whereby it would be possible to make a double-case type-bar machine with a full complement of keys in so compact a form. As the machine is operated the type bars are brought up between fingers arranged below the

of the rock-shaft is a pawl, which engages with an annular ratchet-wheel. When the lever is pulled downward for the purpose of drawing the carriage back to commence a new line, the shaft is rocked and the pawl at its end turns the platen automa-

Fig. 4.—The Carriage.

top plate, which center the type and maintain alignment. The carriage shown in Fig. 4 of the engravings is provided on its under side with grooves corresponding to similar grooves in the top plate of the machine. In these grooves are hardened steel balls, upon which the carriage runs, reducing the friction to a minimum. The

ically a single or double line space, as may be desired.

The manner of feeding the ribbon is another important feature to which the manufacturers of this machine direct particular attention. It consists of a compound motion that feeds the ribbon, which is 1½ inches wide, squarely across its width a

each line of printing. When the carriage is drawn back for the purpose of commencing a new line the ribbon is drawn lengthwise about the width of one type. This serves to bring the entire surface of the ribbon into use. It is stated that the time required to transfer or feed the ribbon from one spool to the other in this machine ranges from two to four days of con-

*The Smith Premier Type-Writer.—Fig. 5.—The Platen Detached.*

tinuous writing. It is also claimed by thus using the entire surface of the ribbon the color of the written sheet is kept uniform, and the curling of the ribbon, so annoying at times, is entirely avoided. This machine employs but a single scale. In case an error should occur, it appears directly over the scale. The carriage may then be moved until the point for correction is opposite the index, or pointer, when, by returning the platen to the writing position and striking the proper key, the error is quickly and surely corrected.

In Fig. 6 is shown the process of cleaning the type. This, it will be noticed, is a somewhat radical departure, and is a labor-saving device which cannot fail to be appreciated by all who are called upon to use type-writers. In operating this device the work may be left in the machine, and by drawing the platen forward and introducing the crank, as indicated in Fig. 6,

*Fig. 6.—Showing Method of Cleaning the Type.*

the type may be brushed by giving the crank a few turns in both directions. This rapidly accomplishes the desired result and possesses many advantages over the old process. The type bars of the machine in their normal position form a circle with the type facing inward. Just below is located the cleaning brush, fitted with a threaded shaft, and upon being turned with the detachable crank, shown at the left of machine in Fig. 1, rises up in contact with the type. When the brush is in its normal position it is entirely out of the way of the type bars in writing. Fig. 7

of the engravings shows the brush-wheel removed from the machine and also the crank for operating it.

At the Mannesmann Pipe Works, at Remscheid-Blieidinghausen, Germany, the Mannesmann process of making pipes from solid bars has thus far been applied in manufacturing on a large scale pipes ranging from 0.8 to 8½ inches in outside diameter and up to nearly 20 feet in length. Pipes of smaller diameter have also been turned out, but have not been placed on the market owing to the demand for the larger sizes. Pipes of a larger outside

*Fig. 7.—Type-Cleaning Brush and Crank.*

diameter than 8½ inches have not yet been made simply because of lack of power at the works. In general, it has been found that with increasing sizes the commercial advantages of the process become more apparent, there being no special mechanical difficulties in manufacturing the larger pipes, while the high speed of rolling, which remains the same for all sizes, makes a larger output possible when handling the large diameters without increasing the working cost. As to the speed

#### Adjustable Transverse Indicator.

The adjustable transverse indicator here illustrated consists of a cast-iron base, to which is attached an indicator arm of polished brass graduated in  $\frac{1}{16}$  inch. At the other end of the stand is a mounted needle beam, proportioned to multiply the deflections ten times, so that  $\frac{1}{16}$  on graduated arm represents  $\frac{1}{160}$  of deflection of specimen, and by judging of the intervals between marks even finer deflections can be noted. The beam is fitted with narrow adjustment for setting the needle at zero and starting the tests. This

*Adjustable Transverse Indicator.*

apparatus is simple and portable, and can be used on the table of any testing machine by seeing that it is properly leveled to suit height of transverse tools used. The importance of this device to those investigating the elasticity of specimens under transverse strain is apparent. An apparatus of this kind can be made in several sizes, suited for the largest as well as

the smallest testing machine. The one we have shown in this illustration was made for the Dennis Long Company, Louisville, Ky., by Riehlé Bros., proprietors of the Philadelphia Scale and Testing Machine Works, Ninth and Master streets, Philadelphia.

**Chain-Making in England.**—In par's of England chain-making is prosecuted to an increasing extent by women and children. During a sitting in London of the House of Lords' Committee representatives of several trades associations testified that frequently one family worked in one workshop and were paid according to the work done, or sometimes at so much per week. These workshops were visited occasionally by the factory inspector, but they were so numerous that they could not be investigated frequently. The iron was given out by weight. Workmen got the material from the masters direct, except in the case of hired workshops. The price received by the middleman who owned and let the shop was often 20 per cent. more than was paid by him to the worker. Generally speaking, the bellows were blown by women, and very hard work it was. Men, women and children, and girls under 18 years of age, worked from 12 to 14 hours a day for four days a week, but not so long on Saturdays and Mondays. Factory inspectors had intervened on a few occasions only. Women and children would earn from 4/ to 6/ per week, and men from 10/ to 12/ or 14/ on common chain.

# CURRENT HARDWARE PRICES.

APRIL 24, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, MAY 2, 1889

## The Apprentice System in Germany.

An official report from Germany on the apprentice system shows that the United States is not the only country which is troubled to know what to do with its boys. There, as here, boys prefer the liberty and comparatively good wages of an unskilled laborer to the self-sacrifice necessary to become skilled artisans. A report received by the Department of State from Commercial Agent Smith, of Mayence, on "Factory Operatives and Apprentices in Germany," says: "There is but slight disposition among manufacturers to provide themselves with skilled laborers by training up apprentices. For this disinclination on the part of manufacturers to take and train up apprentices various reasons are given. One objection often made is that youths want too much freedom nowadays. Then, again, boys do not care to bind themselves for a term of years, but prefer to go into the factories as day laborers with the right to quit when they please. The objection most frequently urged is that the apprentices do not want to serve their time fully out, and when they have acquired a trade leave those of whom they have learned it to go to some one else. There is less running away done by apprentices than a few years ago, even where there is no written contract. This is said to be because labor in general has become more stable, and because apprentices are paid better wages toward the close of their apprenticeship than formerly." Statistics of the total number of apprentices are not given, but the report says that in 3267 factories in Berlin there

had become a solid mass that was removed with difficulty. The other shoes upon the truck were in the same condition. An inspection of these shoes and tires might cause those who are using steel shoes upon steel tires to reflect deeply upon the wisdom of their course.

## Planing Machine, with Quick Return.

This planer is made by the Putnam Machine Company, of Fitchburg, Mass., whose New York office is at 115 Liberty street. The operating mechanism is conveniently arranged, and controls the advancing and receding movements of the table from

side heads on the posts, if desired. When two heads are used, as shown in the engraving, the cross-beam is extended so that one head can be run entirely out of the way, and the other permitted to have the full working range of the machine. Each head slide has a traverse of 12 inches, and has hand and power independent horizontal, vertical and angular feeds. The post heads are independent, and are operated the entire length of the post by power in either direction, besides having a quick hand adjustment. The beam, saddle, head and posts are scraped to surface plates when being fitted. The screws, rods and shafts are of steel, and the elevating screws have hardened joints and

PLANING MACHINE, WITH QUICK RETURN.—BUILT BY THE PUTNAM MACHINE COMPANY.

are 4970 apprentices. This is 66 apprentices to every 1000 workmen; too small a number, the inspector of the district thinks, to supply the bosses, foremen and skilled workmen needed. The general report of the inspectors is that the apprentices are not employed in too great proportion to adult workmen, except in some particular branches of industry and by small establishments, where a good deal of hand labor is used. Complaints, however, of the employment of too large a number of apprentices are noted from various districts.

That the use of steel brake shoes upon steel tires does not produce good results has been demonstrated by the experience of many who have given them a trial. The editor of the *Railway Review* states that he recently saw an irregular lump of steel formed by the cuttings occasioned by the use of steel shoes. These cuttings from the tire had lodged in the recess of the shoe, which was of the Ross type, and

either side of the machine, which has hand and automatic horizontal, vertical and angular feeds, universal feed in the head and extra-coarse surfacing feed. The motive parts consist of large, triple-powered steel shafts, with strong and accurately-cut gears. The rack-pinion is made from a solid steel forged blank. The pulley-pinion is made of rawhide, which, together with a well-proportioned and carefully-built train of gearing, imparts a smooth and lasting motion to the table, which reverses without shock or jar. The beam has a vertical range of 61½ inches, and can be fed (under cut) up or down the entire distance, besides having an automatic quick motion for adjustment to position. The belts are operated by an improved automatic shifter, which acts upon the loose pulley in advance of the other, thereby preventing the excessive wear of the belts and producing little or no noise in reversing.

The machine may be provided with two heads upon the cross-beam, and also with

adjustable steel steps to preserve the original accuracy of the beam. The table is heavy, well ribbed and has pockets at each end. The bed is massive and thoroughly braced, has oil pockets at each end of the ways; also cone disk oil reservoirs, which automatically lubricate the table. Between the housings the bed is made double on each side and arched over, making it extremely stiff at the point of greatest strain. The machine is made in 10, 12, 14, 16, 18, 20, 22 and 24 feet lengths of table.

The Reading Railroad Company are making heavy additions to their freight equipment, particularly for use of the coal and iron department. The Iron Car Company, of New York, are building 640 freight cars and 888 coal cars of the drop-bottom pattern. The Harrisburg Car Company are building 1821 cars, and the refrigerator car equipment is to be increased by 50 cars of the Weeks patent.

### Armor for Ships.

At the twenty-first ordinary meeting of the session of the Institution of Civil Engineers, held on Tuesday, April 9, Sir George B. Bruce, the president, being in the chair, the paper read was on "Armor for Ships," by Sir Nathaniel Barnaby, K.C.B. The author described and illustrated by drawings the applications of armor to ships in the French Navy between 1858 and 1888. He directed attention to the increasing thickness of armor to meet the growth in the gun, to the corresponding reduction in the area of surface covered, and to the eventual disuse of side armor for protecting the batteries. Thereupon the development of quick-firing shell guns was rapidly extended, and high explosives, such as gun-cotton, melinite, bel-lite, lyddite, &c., were introduced, and were being perfected as bursting charges for shells. On the assumption that thin armor was and would remain effective against such projectiles, armor of 4 and 5 inches in thickness was again being demanded by sailors for the defense of the sides of the ship in front of the batteries. Believing that such armor would be costly, ineffective and even dangerous, and that it would tend more than ever to reduce the number of ships which could be brought into action, the author drew attention at the outset to what he conceived to be a wrong policy for England. He observed it was certain that, apart altogether from these quick-firing guns, it would only be necessary to put up targets of thin armor and expose them to the fire of heavy projectiles in order to show the frightful wreck behind the target which occurred years ago, and which led to thicker and ever thicker armor. But there would be this difference in favor of the gun, that the projectiles were heavier and stronger, the velocities higher and the explosives more powerful. He showed that without going beyond the ships now building an expenditure of \$5,000,000 per ship had been reached. On examining all such large ships, whether British or foreign, it would be discovered that they were most seriously exposed to the attack of the powerful weapons now in rapid course of development. The naval authorities had to decide whether they would concur in still further enlargement in individual ships or would endeavor rather to meet these weapons by combining the forces of smaller ships. The author considered there was no difficulty in taking the latter course, and that it had many advantages. The principle of subdivision was consistent with perfect seaworthiness, with speed as high as that of the largest ships, with the control of weapons which could be used with fatal effect upon the most powerful ships of the enemy, and with such powers of endurance as would enable the smaller vessels to receive injuries from the largest ships without necessarily fatal results. If it should be said that this dispersion of force entailed a risk of destruction in detail, by encounters with units of greater force in the hands of an enemy, that argument simply went to show that organizing skill would be required to insure the presence of the united forces where they were needed.

Referring to the concentration of material value in a few ships, thus preventing the construction of many ships, he remarked that in the line-of-battle ship of 50 years ago the value of the material for a single command was about \$500,000, and the value per man in the crews of such ships not more than \$750. In the iron-clad of 12,000 tons to-day the value of ten of the former line-of-battle ships was intrusted to each captain, and not less than \$10,000 to each man in the crew. In order to put forward, in a concrete form, his view as to the type of fighting ship most

suitable for the present needs of the British Navy, he had brought forward a design. It was for a ship of 3200 tons displacement, costing one-fourth of the so-called first-class battle-ship of to-day. A sufficient number of ships of this type could probably be built and armed in two years. It might be said that nothing could be done upon such dimensions and at such cost to entitle the ship to be called a battle-ship. But the 74-gun line-of-battle ship of 50 years ago had only a total displacement of 3000 tons, and the 80-gun ship of the same period 3500 tons. This design came between the two, and would only cost as much as three 74-gun ships. If the British Government determined to spend money upon invulnerable ships, the difficulty of getting enough ships would be perpetually growing. There was no obstacle, except in finding the money, to making an invulnerable ship. Ships could be built and navigated which no torpedo or ram or gun that could be worked from any ship now in existence could fatally wound. In such a ship every man might be absolutely protected, high explosives notwithstanding. But there would be so few of them that commerce and the colonies might be lost for want of ships, and there would only be the satisfaction that the sailors had been protected in such ships as existed. The question was, Ought England at the present moment to move still further onward in increasing the size and cost of heavily-armored ships requiring four or five years to complete? Or ought this country rather to endeavor to increase rapidly the number of protected ships, capable, by reason of their speed and armament, of taking part in any engagement with an enemy, however powerful? In this exposition of the uses of armor it was apparent that fighting ships must continue to use it. When armor was employed in the form of a comparatively thin horizontal plating experiment seemed to have shown that steel low in carbon was the best material. When it was employed in the form of a wall, either upright or inclined, and comparatively thick, the value of a hard face became very marked. The various modes of manufacturing thick armor for upright, or nearly upright, defenses were described, and illustrations were given of the comparative resisting power of compound and of forged steel plates; also of two armor-plates of great excellence, manufactured at Sheffield, one of them compound, having a steel face and an iron back, and the other of forged steel throughout. The superiority of the compound plate was very marked.

The author also drew attention to the improvement effected by the use of the hydraulic press in the manufacture of thick armor-plates. To many minds it seemed that the hope of the future for peaceful sea traders lay rather in abasing than in increasing the individual superiority of the special ship of war. No efforts should be spared to raise the character and strength of the fast mercantile ships. But it must be admitted that there was no prospect of a diminution in the use of armor in regular fighting ships. The evident tendency was toward its introduction into every fighting ship. Referring to the aspect of the question from the side of the attack, the author remarked that when the large unarmored structures in the French ships were considered, the seriousness of the new attack became evident. And it was the artillerist who must be first impressed. It was of more consequence to be able to inflict damage in action than to be able to avoid it. The best defence was to be found in a vigorous attack. It must be understood that the powerful ships in modern navies were not protected, so far as their batteries were concerned, by the armor which the French thought necessary. They were unarmored from their lower

decks upward. The author asked: Was full advantage to be taken in the British Navy of these high explosives in any war which might break out within the next two or three years? Writing before the Government proposals had become known to him, he would agree cheerfully to any suggestions by the Government as to the size of the new ships and as to the use of armor for them if they were laid for approval before some competent technical committee for a month.

### The Work at Panama.

The principal engineering difficulty encountered in excavating for the Panama Canal is well described by H. B. Slaven, president of the American Dredging Company, who built successfully 15 miles of canal on the Colon side, covered by their contract. He says: "The Culebra cut is the sticking point. Into it the company have poured money like water. There are no finer engineers in the world than the French, give them a road to make or a bridge to build where they can have the bureau system developed to the utmost and where there are about seven chiefs and sub-chiefs to each man at work. They require, too, a machine shop next door all the time. But they can't work in this country, or at least on the Isthmus. They are stifled by their red tape. Where an American cannot go straight he will go round or climb over or crawl under an obstacle. The Frenchman must go through it, and that according to the original plans as signed by the chief engineer and 14 subordinates. Now, the highest point of the Culebra cut is over 300 feet above the sea. If you stuck Trinity Church steeple in it you would have to look down about 100 feet to see it. The French engineers calculated the slope at which they thought the sides of the cut ought to stand firm, and they reckoned that 10,000,000 c.m. of earth would have to be taken out. Unfortunately for them the earth refused to stand at the angle they said it would. In other words, they did not allow enough slope for the sides of the great cut. In point of fact there were 20,000,000 c.m. of earth to take out in order to make that cut stand and run a tide-level canal through. This, of course, could be done if there were money enough put up. It is all a question of money." Mr. Sloven's estimate is that the canal can be finished for \$200,000,000 in addition to the \$250,000,000 already expended.

The Philadelphia (Westinghouse) National Gas Company, of Pittsburgh, have for some time been putting gas meters into workshops and mills where the consumption of fuel has not exceeded the measuring capacity of the largest meters. Heretofore it has been practically optional with manufacturers, but recently the Philadelphia Company determined upon compulsion. This action was taken to prevent the wasting of gas, which has been going on since its introduction into Pittsburgh. Within a short time it is expected that the company will have a meter of sufficient size to measure the consumption of gas at the largest mills in Pittsburgh.

A vein of copper ore, 10 to 12 feet in width, has been discovered in Duluth while excavating for the Masonic Temple, and will probably be worked just outside the city limits.

A dozen cotton-seed oil mills, to cost \$1,000,000 or more, are in course of erection throughout the South, and to a certain extent are in competition with the Northern hog.

**Speed Regulator.**

The accompanying engravings, for which and the description we are indebted to *Industries*, represent a speed regulator which is being placed on the market by James Williams, of Manchester, England: "The novel part of the apparatus consists of a two-armed lever, with a central boss bored to fit the governor rocking shaft A, upon which it is fastened. At the end of each arm is a cylindrical vessel, into which

Such is a brief description of this apparatus, and a few words may now be said about the principle of its action. Suppose, for instance, that, as shown in Fig. 2, the governor balls are low, the mercury has run from the right to the left hand vessel and is consequently exercising a torsional strain on the rocking shaft in that direction. If, however, the sleeve of the governor is raised by reason of the increase of speed, the rocking shaft will be rotated by means of the fork, and the

Fig. 1.

HIGGINSON'S SPEED REGULATOR.

a definite weight of mercury is introduced. These vessels are connected at the lower ends by means of a small tube, in the center of which is a tap, and at their upper ends by another tube. The latter enables the vessels to be made air-tight, and constitutes a means by which an air communication is made between them. It will be

Fig. 2.

obvious that so long as the two vessels are in the same horizontal plane the level of the mercury in each will be alike; while if one is raised above the other, as shown in Fig. 2, the mercury will flow along the lower tube into the depressed vessel until the surfaces are again level, and by adjusting the tap shown the speed of this flow can be regulated. At the same time that the mercury is leaving the one vessel and passing into the other, the air contained above it can also pass by the upper tube, and the balance is thus maintained."

position of the two vessels would be reversed. In this case the shaft would be helped to make a movement in a new direction, which is equivalent to the removal of a certain weight from the governor. The provision of the small tap in the mercury tube prevents this removal or accretion of weight taking place too rapidly, and so avoids anything like hunting of the engine. It may occur that in order to preserve the isochronism of the governor it is necessary to add a greater weight when it is at its lowest position than is removed when it is assuming the higher. It that case taper filling pieces of iron are introduced into the vessels, and made of such a size and so fitted that at all positions of the vessels the required weight is added. It will be understood that the amount of mercury used will vary with the construction and size of the governor dealt with. The apparatus is quite self-contained, and only requires fixing on the rocking shaft to be ready for action. The regulator is simple, of small first cost and should be practically undamageable. Electrical engineers especially may find in this regulator a ready means of correcting the speed of the engines used by them, while it does not involve any supplementary driving or excessive complication.

As the result of the work done by the Michigan Stove Company, of Detroit, in testing and applying aluminium additions to iron in making castings, they were the recipients of many letters containing inquiries, &c. They have made arrangements with a producer of aluminium who makes about 50 pounds per day to supply the metal to purchasers at \$5 per pound. The quality of the metal has steadily improved. One of the first lots contained 95.5 per cent. aluminium, 1.62 silicon and 2.88 iron. Another lot showed by analysis

96.35 per cent. of aluminium, 2.16 per cent. of silver, 1.47 per cent. of iron and 0.02 of copper. A few days since a 50-pound lot just received carried 98.34 of aluminium, 1.34 silicon and 0.32 iron. At first considerable trouble was experienced in endeavoring to roll the metal, but now it is rolled to any thickness. The Michigan Stove Company have recently received some foil, and also a quantity rolled to No. 8 Brown & Sharp gauge. They are ready to supply it from  $\frac{1}{4}$  inch down. They attain good results down to 0.005 inch in plates 9 inches wide. The Michigan Stove Company certainly deserve credit for the energy which they have displayed in this matter. They have done more than any one to bring the properties of aluminium into public notice, and are instrumental in bringing the price down to a point where the metal can come into general use.

**Our Trade with China.**

The delay on the part of the President in the appointment of a Minister to China is said to be due to a desire of the Administration to select for the office not only a good diplomat, but a man who will be likely to exert influence in the development of trade between China and the United States. Our trade with China has not varied much in aggregate value during the last ten years, but the exports from the United States to China have been gradually increasing since 1870. In 1878 the total value of imports and exports of merchandise was \$24,987,738; in 1888 it was \$26,061,000. In seven out of these ten years, however, the total commerce exceeded the figure for the last year. This figure was also exceeded in 1872 and 1873. The exports in 1870 were valued at \$3,116,381; in 1878 they were \$6,867,255, and in 1888, \$7,926,000. The year of largest exports was 1886, when they amounted to \$11,576,817. Our exports to China during the last fiscal year were less than they have been in seven years, with the exception of 1884. Our imports from China were less than for eight years, with the exception of 1884 and 1885. Our imports from China are chiefly tea, raw silk, hides and skins, materials for hats and bonnets, furs and rice. Our exports are principally cotton cloths and illuminating oils. We sent \$5,181,050 worth of cotton goods to China alone in 1887, and in 1888 \$3,128,771 worth. For the first eight months of the present fiscal year our exports of cotton cloths, so far as shown by Government statistics, were only \$823,808, as compared with \$2,096,347 for the first eight months of 1888. This would seem to indicate that the result of the hasty action of Congress early last autumn in passing the Chinese Exclusion bill had been to diminish the demand from China for our goods. This tendency is shown also in the exports of mineral oils.

The commerce of the United States with China in 1886 (one of the greatest years) was estimated at only 8 per cent. of the entire foreign commerce of that country, while that of Great Britain was estimated at 75 per cent. The geographical position of the United States gives them commercial advantages over Great Britain and over most other countries in the securing of Chinese trade, and when the importance of the country's resources are considered, the necessity for maintaining cordial official relations between the Government of China and our own is more thoroughly appreciated. The figures given above showing the decrease in our exports thither since last June seem to make a very pointed moral to Congressional mischief-making for political ends, and ought to be sufficient warning for the future.

### Facing Machine.

We have previously illustrated several tools of a new system for finishing bolts and nuts. In our issue of September 22, 1887, we described a machine for finishing the sides of bolt-heads and nuts called a

ing it in position. A long hole through the spindle permits the placing of a bolt 20 inches in length. The bolts are held by universal chucks. For nuts the racking is used, which insures true dressing in relation to the axis, and which at the same time admits of a loose fit on the

the plunger, and the work must, of necessity, be uniform as long as the two spindles remain duplicates, as the distance traveled by the plunger at each stroke is always the same. This machine is built by Nicholson & Waterman, of Providence, R. I.

Fig. 1.

THE NICHOLSON FACING MACHINE.

broaching and milling machine. In this issue we show the perfected companion tool—one for dressing the top and bottom of nuts and the top of bolt-heads. The work done by this machine is the finishing of the tops uniformly, as a matter of taste, and the dressing of the bottom true with the axis of the thread, at the same time relieving the corners and chamfering the first thread. At one end of the table is the cutter-holder and its driving mechanism, and at the other end the spindles for carrying the nuts or bolts to be dressed. Two spindles, duplicates of each other, are

thread of the spindle, a most important item in rapidly removing and replacing nuts.

The movement of the cutter-head is governed by a cam and weight. The cam is made to advance gradually and recede

The Bookwalter or Robert process for the manufacture of steel is likely to be very thoroughly tested in the West this year. The Michigan Steel Company, of Detroit, are rapidly pushing work on their plant, which they hope to have in operation early in June. The machinery is being built by the Morgan Engineering Company, of Alliance, Ohio. The steel to be turned out by these works will be of a special quality for springs to be manufactured by the Detroit Steel and Spring Works. At Chicago the Fowler Steel Car-wheel Company have their buildings erected for the steel works, and will be prepared at an early day to put in the machinery, which they expect to start up in July. Their plant will make steel castings in the form of wheel-blanks for their rolling machine. The plans which have been prepared for these works show a remarkably compact and convenient arrangement of the several departments, which is worthy of extended description. Another steel plant on this system is projected near Chicago, but negotiations with the owners of the patents have not yet been completed. If this plant is built it will make a dead soft steel to take the place of highly refined iron in the manufacture of a specialty. A peculiar characteristic of the Robert steel, which was noted by a very practical engineer who spent some time in investigating the process at Springfield, Ohio, is the

Fig. 2.—Cross Section of Spindles.

placed one above the other, and as the driving pulley on the counter-shaft is larger than those on the spindles, the upper spindle always remains stationary. This enables the operator to remove and replace the work, while at the same time a plunger carrying cutters advances, dresses the work and retires quickly. At this moment the operator reverses the spindles, bringing the dressed nut uppermost in position for replacing. The number of oscillations made by the cutter-holder represent faces dressed, and can be varied to suit the requirements from 1 to 4 per minute. The two spindles run in tapered hardened bearings provided with take-up for wear. The drum on the spool has handles for revolving it and hardened pins for lock-

Fig. 3.—Section of Cutter-Holder.

quickly, remaining removed a sufficient time to allow the operator to reverse the spindle. The number of movements back and forth in a given time can be altered by changing the gears which connect the cam-shaft with the shaft carrying the worm gear. Power is furnished by a

difference of hardness between it and open-hearth steel. He states, for instance, that 0.15 carbon Robert steel is as hard as 0.25 carbon open-hearth steel. This is a more decided difference than that which has been found to exist between open-hearth and Bessemer steel, less carbon contents being required in the former to equal that of the latter.

A test of the edge-tools made of steel produced by the Falls City Malleable Iron and Steel Company, of Louisville, Ky., was made lately by F. R. Levering at the works of the United States Rolling Stock Company, at Anniston, Ala.

Immigration was a little heavier in 1888 than in 1887, the total number of persons entering being 525,019, against 516,933 in 1887, 392,887 in 1886 and 332,361 in 1885. This is exclusive of the overland immigration from Canada and Mexico. An analysis of the figures shows that of the immigrants 326,556 were males and 198,463 were females. Great Britain sent 173,141, of which 71,966 were from Ireland. The Germans numbered 106,975, the Swedes 48,845, the Italians 47,424, the Russians 35,504, the Austrians 25,080 and the Hungarians 12,856.

Fig. 4.—Cutting Tools.

narrow belt turning a cone on the worm shaft, which through suitable gearing drives the cam, which forces forward the plunger, carrying the cutting tools, the plunger being withdrawn by the weight arranged as shown in Fig. 3. The product of the machine is controlled by the rapidity of movement of the cam moving

**The Catasauqua Scrap-Iron Frauds.**

Ex-Burgess Philip Storm, of Catasauqua, Pa., was lately arrested on a *capias* charging him with having assisted in defrauding the Catasauqua Mfg. Company out of \$12,862.61. A *capias* has also been issued for the arrest of John W. Hopkins, the present Burgess of Catasauqua, but he cannot be found, having disappeared several weeks ago. Hopkins was assistant superintendent of the Catasauqua Mfg. Company, and weighed the scrap-iron furnished by Storm. He made false entries, and the money paid for scrap-iron in excess of what the company actually received is alleged to have been divided by Storm and Hopkins. Storm was placed under \$13,000 bail. The amount of scrap-iron paid for and not received amounted

## Leavitt Air Compressor

FOR

### the Calumet and Hecla Mines.

The air compressor of which we herewith present drawings of some of the more prominent parts was designed by E. D. Leavitt, Jr., and built by the I. P. Morris Company for the Calumet and Hecla Mining Company. It is now located at the Hecla mine. [Figs. 1, 2, 8, 16, and 17 will be found on supplementary sheet.]

The compressor has two double-acting plungers of 42 inches diameter and 60 inches stroke, and operates upon the displacement principle, the plunger working through a central packing or bearing in a

being 8 feet deep and 36 inches wide. The compressor measures over all 40 feet 6½ inches, and the cylinders are placed 14 feet between centers. Each of the two bed-plates, the forms of which are clearly outlined in the plan and side elevation of the entire compressor, Figs. 1 and 2, is a single casting weighing, finished, 38,000 pounds. The extreme measurement of the plate is 25 feet 11½ inches. Each plate is held to the foundation by nine 3-inch bolts, distributed four at the cross-head, two at the center and three at the outer end. The jaws to receive the shaft bearings are rectangular and each measures 20½ inches deep, 26 inches long and 28 inches wide. The boxes are babbitted and formed with circular dovetailed grooves to receive and hold the babbitt. The adjustment of the bearing is accomplished by means of two wedges 28 inches wide and 12½ inches in

Fig. 4.—Vertical Section Adjustable Pedestal.

to 1,493,015 pounds. The fraud has been carried on since 1886.

Referring to the dispatch from Allentown, recently printed in some of the daily papers, that Oliver Williams, president of the Catasauqua Mfg. Company, had been requested to resign, we are informed by one of the directors of the company that there is not the slightest foundation for the report. Mr. Williams has been manager of the company for over 20 years, and is one of the largest stockholders. Under his management the corporation has grown to be one of the largest and most successful in the Lehigh Valley. The plant was small and insignificant when he assumed control. The company has accumulated a large reserve fund, has paid dividends regularly, and has an enviable reputation for its products. In the prosecution of the men who have defrauded the company through sales of scrap-iron, every step has been taken after consultation with the board of directors, and they are a unit in supporting Mr. Williams in the course he has adopted. He is so well known in the Eastern trade that a denial of the rumors is hardly needed by his friends.

cylinder partly filled with water. The cylinder is divided by the bearing and plunger into two compartments, each of which is partly filled with water, the quantity being such that the plunger is always entirely submerged, even when at either end of its stroke. Each movement of the plunger lowers the water in one compartment of the cylinder and raises it in the other, the water thus acting, to all intents and purposes, as an extension of the plunger. The lowering water draws in air from the atmosphere through two rows of valves encircling the dome or air receiver, and at the same time the advancing plunger forces the water in the opposite compartment upward into the valve-chest, thereby displacing the air which had been admitted during the preceding half of the stroke. Provision is made for the forcing, through many finely punctured nozzles, of water into the upper part of the valve-chest during the compression and expulsion of the air.

The foundation consists of a body of concrete upon which is built a bed of brick 13 feet 6 inches thick, 60 feet long and 33 feet 8 inches wide, the wheel-pit

being 8 feet deep and 36 inches wide. The compressor measures over all 40 feet 6½ inches, and the cylinders are placed 14 feet between centers. Each of the two bed-plates, the forms of which are clearly outlined in the plan and side elevation of the entire compressor, Figs. 1 and 2, is a single casting weighing, finished, 38,000 pounds. The extreme measurement of the plate is 25 feet 11½ inches. Each plate is held to the foundation by nine 3-inch bolts, distributed four at the cross-head, two at the center and three at the outer end. The jaws to receive the shaft bearings are rectangular and each measures 20½ inches deep, 26 inches long and 28 inches wide. The boxes are babbitted and formed with circular dovetailed grooves to receive and hold the babbitt. The adjustment of the bearing is accomplished by means of two wedges 28 inches wide and 12½ inches in

height, the true movement of each of which is obtained by two square threaded screws, one of which is united to each end of the base of the wedge, which is, of course, inverted and operated from the top of the cap. Each screw carries a steel gear, between and meshing with each of which is an intermediate gear, also of steel, the teeth being cut absolutely free from backlash. It is evident that any movement of either of the main gears will raise or lower the wedge to which the screws are united, and will do this without the possibility of bringing the wedge to an uneven bearing. The three adjustable pedestals carrying the pinion shaft are bolted to the top of the bed-plate, their center line being 14 feet 4½ inches horizontally and 4 feet 3 inches vertically from the center of the crankshaft. Their construction is shown in the drawing Fig. 4. The box consists of four parts, each of which can be adjusted independently. The top and two side parts of the bearing are moved to adjustment by means of square threaded studs, while the bottom quarter is actuated by a wedge moved by a screw and the lower surface of which is horizontal and upper surface in-

clined  $1\frac{1}{4}$  inches per foot. Horizontal and vertical angular movements are provided for by the concave chocks in which the brasses rest. Accurate aligning of the three bearings of this, which is really the driving shaft, is thus obtained.

The cranks, crank pins, shafts and connecting rods are of Krupp's oil-tempered crucible steel, having an elastic limit of 45,000 pounds per square inch and an elongation of 18 per cent. in 10 inches. Each crank is 11 inches thick, 2 feet 9 inches in diameter at the shaft and 20 inches in diameter at the pin. The crank is bored  $18\frac{1}{2}$  inches to fit the shaft to which it is keyed. The pin is forced into the crank, and is 10 inches in diameter and 10 inches bearing length. The crank-shaft is 13 feet 2 inches long,  $16\frac{1}{2}$  inches in diameter at the bearings and 19 inches in diameter at the gear. It is made hollow, the diameter of the bore being 6 inches. The length of connecting rods between centers is 15 feet, and over all 17 feet  $\frac{1}{2}$  inch. Each weighs, complete, 3860 pounds. At the cross-head the rod is 6 inches in diameter, and at the crank end  $10\frac{1}{2} \times 7$  inches. The crank-end boxes are cast steel and the cross-head boxes are brass, both babbitted. The adjustment of the box in each bearing is provided for by a wedge operated by two square threaded bolts placed in line, and one entering the wedge from each side. By means of these bolts the box, through the upward or downward movement of the wedge, can be brought to the desired bearing. The cross-head gibs are of cast iron, the bodies being Eureka steel, and their surfaces are babbitted and turned to a circle 30 inches in diameter. The bearing is  $2\frac{1}{4}$  feet long and 18 inches wide measured on the chord. The pin is ground in the two webs of the body, and on it is keyed a sleeve, 8 inches in diameter, to which the connecting rod-bearing fits. The inner end of each bed-plate is circular in section, 5 feet in diameter, and is flanged to receive bolt-holes and faced to fit the end of the cylinder.

Each cylinder is formed of a single casting faced at the top, ends and side to receive, respectively, the valve-chest, heads, and manhole plates. The casting is  $2\frac{1}{4}$  inches thick. The plunger bearing is formed in the lower part of a wall dividing

has a diameter of 6 feet. The cylinder bushing is of composition and is 28 inches long. The plunger, of which we show a longitudinal section in place in the cylinder, is 42 inches in diameter outside,  $7\frac{1}{4}$  feet long

being  $2\frac{1}{4}$  inches thick. The top is faced to receive the valve seats, the openings for which are 4 inches in diameter. The arrangement of both the inlet and outlet valves is shown in Fig. 7, which is a plan

Figs. 7 and 8.—Plan and Vertical Section of Valve Chest.

without the heads. The shell is  $\frac{1}{4}$  inch thick and is cast with 4-inch ribs at every 15 inches. The front head is formed with 12 radial ribs 1 inch thick and  $16\frac{1}{2}$  inches deep. The plunger-rod is made of forged

view of the top of the valve chest, a vertical section of which is shown in Fig. 8. Thirty-six inlet valves are placed in a circle 5 feet  $7\frac{1}{4}$  inches in diameter, and 30 inlet valves are placed in a circle 4 feet

Fig. 5.—Vertical Longitudinal Section through Cylinder and Plunger.

the cylinder into two compartments. This wall is strengthened by means of ribs, as shown in the drawings of both the longitudinal and cross-section, Figs. 5 and 6.

The cylinder measures  $13\frac{1}{2}$  feet over all and

crucible steel, 6 inches in diameter and 8 feet  $8\frac{1}{2}$  inches long over all.

The valve chest for each cylinder is circular in plan, 6 feet  $1\frac{1}{4}$  inches in diameter inside and 3 feet  $1\frac{1}{4}$  inches in height, the sides

$8\frac{1}{2}$  inches in diameter, these two circles being outside the air receivers. Within each air receiver are 18 delivery valves in a circle 2 feet 11 inches in diameter, 12 in a circle  $23\frac{1}{4}$  inches in diameter and 6 in a

circle 11½ inches in diameter. Each receiver is 8 feet 8 inches in diameter, and is held to the valve seat by 1½-inch bolts passing through a flange located between

of inlet-valves. On its return the plunger displaces and thereby raises the water in the cylinder, which forces the air which had been drawn from the atmosphere up

principle as the compressor—namely, a plunger working in a circular packing in a cylinder and operating by displacement—is so arranged as to deliver water to the nozzles in that chest from which the air is passing to the air receiver, the vast number of small holes in the nozzles insuring the perfect and thorough distribution of water to all parts of the chest.

The practice of injecting water into the cylinder at each stroke in order to absorb the heat created by the compression has been discarded by some of the manufacturers of air compressors, who claim that the air, from the compressor to the machine operated, should be kept as dry and free from moisture as possible in order to prevent freezing of water at the exhaust ports. The spray injection was, therefore, condemned as the direct cause of much needless trouble. A second objection was also brought forward—a mechanical one—that the presence of water in the cylinder prevented the proper lubrication of the piston, and quick wearing of the parts resulted.

It will be observed that in the compressor we are describing a most perfect and thorough system of water injection has been provided, and that seemingly an attempt has been made to saturate the air with moisture. The plunger is completely submerged at all times. And yet this same compressor has shown no signs of un-

Fig. 9.—Inlet Valve.

Fig. 10.—Delivery Valve.

the inlet and outlet circles of valves. Each pair of receivers is connected by a pipe, half of which is cast with each receiver, and from each pair leads a 16-inch cast-iron delivery-pipe.

The valves are shown in the drawings Figs. 9 and 10.

The injection piping in each valve chest is placed beneath the valve seats, and consists of two hexagonal rows of brass pipes, as shown in the plan Fig. 11, the inner row being of 1½-inch pipe and the outer of 2-inch. On the smaller piping are placed six rose nozzles and on the outer 12, each nozzle being drilled with 55 holes ⅛ inch in diameter. A section and development of the nozzle are shown in Fig. 13. The nozzles are supplied with water by a pump having a bore of 7 inches and a stroke of 12 inches, located one at each inner side of each cylinder, and operated by an eccentric on the crank-shaft. Provision is made for draining the air re-

Figs. 14 and 15.—Mortise Pinion.

Fig. 6.—Cross Section through Center of Cylinder.

ceivers through properly arranged piping. From the foregoing the action of the compressor will be readily understood. The advancing plunger draws the air into the valve chest through the two outer rows

through the delivery-valves into the air receiver, the same action taking place, but alternately, in the other end of the cylinder. The stroke of the pump, which is constructed to operate upon the same

usual wear, and no trouble whatever has resulted from the condensation and freezing of vapor at the exhaust ports of the drills.

The compressor is driven through the pinion-shaft by the compound engine Frontenac, which also drives a duplicate compressor and a Rand compressor with cylinders 28 inches diameter by 48 inches stroke.

The pinion, Figs. 14 and 15, is 10 feet in pitch diameter, 30 inches face and is cast in two segments, each of four arms. The arms are rectangular in section, with rounded corners, 8 x 16 inches, the former measurement being in the plane of the wheel. The sides of the arms are 1½ inches thick, and with the plane are 2½ inches thick. The rim is cast with four rectangular grooves 12 inches deep and 6½ inches wide, each being formed by two outer and three inner flanges. The 80 teeth are of the best quality of young hickory thoroughly seasoned. The meeting surfaces of the two segments are faced and united by four 2-inch and two 2½-inch bolts at the hub, placed as shown in the drawing, and 1½-inch bolts through flanges at the rim. Over lateral lugs at the sides of the rim at the joint are shrunk wrought-iron yokes. The weight of the wheel complete is 28,000 pounds. The spur gear, Figs. 16 and 17, has a pitch diameter of 20 feet, 30 inches face, 160 cut teeth and is cast in eight segments. The outer ends of the segments

are faced, flanged and held by four 2-inch bolts. The arms are hollow,  $2\frac{1}{2}$  inches thick in the plane of the wheel and  $1\frac{1}{2}$  inches thick at the sides. Where the spoke, which is elliptical in section, joins the rim, its dimensions outside are 18 inches x  $8\frac{1}{2}$  inches, and at the hub 15 x 10

of bronze alloy, containing 10 per cent., 1 pound of which would be 10/6, and the other 9 pounds of copper at market price, say 9d per pound, and in the ferro aluminium costs 12/6 per pound, and no charge for the iron. The ferro-aluminium ranges from 10 to 18 per cent. aluminium.

and cast in the usual way, when the iron is found to have taken up 1.75 per cent. of aluminium. The castings are exceedingly sonorous, have a white fracture and are quite free from blow-holes.

We have also the Castner process at work at Oldbury, producing from 400 to 500 pounds of pure aluminium per day. This system is entirely different from those already described, and depends (1) upon the cheap manufacture of sodium, (2) on the manufacture of a double chloride of sodium and aluminium, and (3) on the manufacture of pure aluminium. The success of the Castner process lies in the fact that by a new process the cost of sodium has been reduced from 4/ to 1/ per pound, and of aluminium from 60/ to less than 20/. The aluminium is produced in pigs of 4 pounds weight; the same size of bar in bronze, containing 90 per cent. of copper and 10 per cent. of aluminium, would weigh 12 pounds. With sodium at this low cost, it is said that not only are we to have aluminium cheap, but also magnesium, silicon and boron, and we may then lookout for more new alloys. Pure cast aluminium has a density of 2.56, forged 2.67, or only one-third that of forged steel. It melts at about 1300° F., and is the best conductor of heat and electricity known, and practically is inoxidizable even at high temperatures. Aluminium silver, composed of aluminium, copper and nickel, makes excellent cutlery, will take an edge like steel, cuts the hardest wood and does not require electroplating. A new alloy, with 10 per cent. of tin and aluminium, has nearly the same density as pure aluminium, and can be used as a solder, will take a fine polish and not tarnish. It will be seen what rapid strides the manufacture of this most interesting metal is making. That there is room for all that can be made is evident from the numerous applications I have mentioned, and that the most successful should be in the shape of an alloy rather than a pure state seems strange.

Figs. 11 and 12.—Plan and Vertical Section of Valve Chest, Showing Injection Piping.

inches. The inner end of the arm is turned to form a tenon 8 inches in diameter at its inner end and 10 inches at its outer portion. This tenon fits in a bored mortise in the center. The arm widens above the tenon and is faced to accurately fit the center, to which it is held by four  $1\frac{1}{2}$ -inch bolts. It is further secured by a wrought-iron key extending transversely. The center has eight faced sides to receive the arms and is  $5\frac{1}{2}$  feet in diameter. After the hub had been forced on the crank-shaft by a pressure of 200 tons, two wrought-iron bands were shrunk on recesses turned in the outer ends of the hub.

#### Aluminium Alloys.

In an address delivered by Charles Wood, as president, before the Cleveland Institution of Engineers, the following reference is made to aluminium alloys:

Aluminium brass, in consequence of its toughness, rigidity and strength, is sure to come into use; the specific gravity being only 7.6, makes it cheap at £108 per ton. The ordinary brass will carry about 40 tons with 9 per cent. elastic limit, and is being largely used by the American Government for propellers, hydraulic work, pinions, &c. A special mixture has been tried on the London tramcar bearings with excellent results. Another interesting feature is that the bronze will stand high temperature without loss of strength. The electric furnace aluminium copper alloy is sold at 10/6 per pound of aluminium guaranteed by analysis, and the copper at market price—that is, if we take 10 pounds

As in copper, the direct addition of pure aluminium to iron and steel is a great loss; it floats on the top of the molten metal and passes off with the slag, and it will be at once seen that the ferro-aluminium pos-

Fig. 13.—Injection Rose.

sesses a great advantage, as it amalgamates immediately without loss. A new process has within a month been brought out by Messrs. Brin Brothers, of London, who mix a rich clay with a flux into a paste, and charge this in alternate layers with thin cast-iron scrap into a cupola; the iron, when melted, is run out into a ladle

A large plate-glass deal was effected in Pittsburgh recently by the Pittsburgh Plate Glass Company, who are said to have paid \$1,500,000 for the Forest Plate Glass Works, thus securing control of the entire plate-glass business in that section, if not in the country. The company already owned two large factories, and this acquisition of the third gives them con-

Development of Rose.

trol of a combined production of 500,000 feet of plate-glass per month. The three factories are all in the Allegheny Valley, near Pittsburgh. Capt. J. B. Ford, who was the principal owner of the Forest City works, is also a heavy stockholder in the Pittsburgh company.

The present population of Chicago is 853,000. By incorporating in a single municipality the half-dozen villages in her environs, as contemplated by a bill pending in the State Legislature, she will have 1,221,000 inhabitants and rank second only to New York among American cities.

FIG. 1.—PLAN.

## THE WEEK.

The North German Lloyds Steamship Company, one of the most successful in the Transatlantic trade, in their balance sheet for 1888 show an exceptionally strong position. The fleet comprises 140,000 tons, standing on the books at a valuation exceeding \$13,000,000. Besides they hold property worth at least \$2,000,000 and \$1,400,000 in cash and securities.

One of the Paris newspapers, whose founder is an American, urges the importance of sending out from the United States a strong representation of trained mechanics to the Paris Exposition. An idea that should be heeded.

C. P. Treat, the well-known railroad contractor, who has been with a company of engineers on the Nicaragua Canal for some time past, says an expedition will start from the United States May 10, and upon its arrival at Greytown active work will be begun. A hotel to accommodate 500 people will be shipped to Greytown by a New York company.

The Monongahela Furnace Company, who are connected with the National Tube Works Company, of McKeesport, have broken ground for the large blast furnaces which will be erected in that town. The building of the furnace will be commenced about May 1.

Charles Denby, United States Minister to China, speaking of taxation in that country, says: "The chief tax is on land; there is no tax on personality. The land tax, the salt monopoly, lekin, foreign and native customs duties, and the proceeds of sales of honors and offices make up the revenue of the State. To the absence of taxation of the people," he says, "may well be ascribed the permanence of the Government and the tranquillity and contentment of the Chinese race."

Admiral Kimberly, in his official report of the disaster at Samoa, commends Captain Kane, of the English steamer Caliope, which successfully steamed out of the harbor, for turning over to the Americans his complete diving outfit, which would prove valuable in saving guns, &c.

Laredo, Tex., is a rising city on our Southern border, like Tacoma, Seattle and other points in the extreme Northwest, the outgrowth of railroad extension. The completion of the Mexican National Railway through to the City of Mexico from Laredo last November gave such an impetus to international traffic that in less than six months Laredo can boast all the modern conveniences characteristic of American cities—viz., two steel bridges of six spans each across the Rio Grande, one for railroad purposes and the other for general traffic; an electric light plant, lighting the twin cities Laredo, Tex., and New Laredo, Mexico; a Holly system of works with more than 11 miles of mains; an ore reduction works, an electric motor street railway system, now in course of construction; the Mexican National Railway machine shops, to cost \$600,000, and the largest shops west of the Mississippi River. As a manufacturing center Laredo claims to possess advantages seldom found in growing cities; coal in large quantities at her door, water, light and power in abundance, and her citizens predict that she will become the largest and most important city on the line of traffic between South America, Mexico and the United States.

Lord Lonsdale, who started from the Hudson Bay Company's station a year ago on Arctic exploration, reports that near Peace River he discovered a remarkable formation of salt, and mica in blocks 8 to 12 feet square. In the region of Hay

River he found the Alexandria Falls, about 200 feet high and  $1\frac{1}{4}$  miles wide at the top, which appeared much grander than Niagara.

In Boston, where both the conduit and overhead-wire systems of electric car propulsion have been tested by daily use during the past three months, the latter seems to be regarded as by far the more advantageous. In very wet weather there has been too great a leakage of power from the conduits, and in more than one instance the cars have had to depend on horses for propulsion. Malicious persons, by sticking a bit of iron into the conduit, can at any time make a "short circuit" and stop all cars beyond that point.

The chartering of an iron steamship to load 80,000 bags of sugar at Matanzas, and to tow the barge Atlas with a full cargo from the same destination to the Delaware Breakwater, marks an innovation in the shipping trade.

Colonel Auchmuty, the New York architect and builder, is doing an excellent work in his trade schools in training young Americans to a practical knowledge of such industries as bricklaying, plumbing, carpentering, stonemason work, and the like. It is said that \$750,000,000 pass yearly through the hands of the master builders of this country, and until Colonel Auchmuty started his trade schools, in the absence of the apprenticeship system of the Old World, most of the skilled artisans were foreigners. Two thousand young men have been already graduated from the institution, which he began as an individual enterprise, and are finding their way into good positions throughout the country. They have had every advantage that education can give them, and the final test of their mechanical skill and general efficiency has been reached through examinations, prizes and public exhibitions, which are powerful incentives to good work.

The Newfoundland seal fisheries are this season prolific beyond anything known heretofore. One vessel entered the harbor of St. Johns with 38,000 seals aboard; another took in 32,000, another 31,000, and several others almost as many. Judging from the cargoes already delivered it is estimated that the spring catch will number over 500,000—worth \$1,125,000. The seals are taken on the ice off the east and north coasts.

The Haytien admiral, Howard M. Paterson, ex-instructor of the New York School of Navigation, has come to New York to buy a steamer for the Legitime faction, whose triumph he predicts to be very near.

Claus Spreckels will start the \$3,000,000 sugar refinery in Philadelphia about June 1, and his confidence of success is not a whit abated. He is quite ready to fight the trust on their own ground. The factory for beet sugar erected by him at Watsonville, Cal., at a cost of \$500,000, has declared a dividend of 5 per cent. on the first year's operations. Mr. Spreckels says: "My own idea is that in a few years we will import no sugar. Not only does the beet grow to perfection in California, but it can as easily be grown here in the Central States, and in Kansas particularly. In California we get from it 13 per cent. of sugar to 9 per cent. that the European beet produces. A short time ago the few remaining shares of a \$5,000,000 stock company, of which I own a majority, were subscribed in San Francisco and a new company incorporated, which will be amply able to supply America with beet sugar. After this first year's trial we shall now go into the business on a large scale. Ten new factories at a cost of \$500,000 each will be built in different parts of California. They will turn out only the raw sugar, it having been found impracticable to at-

tempt to refine at the factory during the season. The product will be sold to refiners. The Philadelphia refinery will not handle this beet sugar. It will be wholly devoted to refining the raw imported article. With both of these companies in operation I think I can work against any trust."

The Roosevelt Hospital, in this city, receives by the will of William J. Syms \$350,000, the larger part of this amount to be expended for the construction of a "surgical operating theater."

Letters received from the contractors engaged in building the Chignecto Ship Railway, between the Bay of Fundy and the Gulf of St. Lawrence, report rapid progress, the winter having been very favorable for the work. The success of the project is considered assured, as it has been subsidized by the British Government to the extent of \$170,000 annually for 20 years. The railway is 17 miles in length, and the contractors agree to have it finished about August, 1890. It is being built on the same principle as the proposed Tehuantepec Ship Railway. The engineers and builders are Benjamin Baker and John Towler, the latter known as having built the great bridge across the Firth of Forth, in Scotland, and ranking high among modern engineers.

Sea post-offices on the mail vessels plying between the United States and ports in Europe, after the manner adopted on our interior mail routes, is a suggestion worthy of consideration. Attention is directed to the fact that much delay is occasioned in the delivery of the mails owing to the fact that they have to be assorted and distributed after being landed at the port of destination of the steamer. The suggestion is made by the German post-office authorities in Berlin that Germany and America share equally the expense of employing clerks for the distribution of the mail while crossing the ocean, so that when the mail arrives at the port of destination it will have been assorted for all the large distributing offices, either in Germany or the United States.

Crop accounts carefully collected from all parts of California give assurance of an enormous harvest the coming season. The wheat fields are already heading out rapidly and promise the largest crop ever known. Fruit and vines look well.

The companies whose poles have been removed from the streets by Mayor Grant's orders are smarting severely at the penalty of delay. Many of the poles cost \$100 each, aside from the work of erecting them and stringing the wires.

The sunken steamer Atlas, in the North River, was moved several hundred feet, when unfortunately the swash from a passing steamer caused the chains to break from the pontoons and she again sunk.

The big Rockaway Hotel, which cost over \$500,000 to carry out the first building plans, and nearly double that sum before it was completed, was sold for \$27,000 to C. F. Southard & Co., dealers in building materials.

Yellow fever has already taken one victim in Florida this season, the disease having appeared at Sanford, about six miles from Enterprise. Surgeon-General Hamilton and the State Board of Health have been in conference to prevent the spread of contagious diseases. Those points are believed to be most exposed which escaped last year, as residents who have once been through the ordeal are supposed to be comparatively safe.

The new floating palace Puritan, of the Fall River Line, fully realizes expectations, the working of the engines being perfect.

Andrew Fletcher, of the W. & A. Fletcher Company, who built the engines, said after the first trip that the Puritan will easily travel 21 miles an hour. "The record of the run," said Mr. Fletcher, "shows that the boat made over 20 miles an hour, and that, too, under only 65 pounds pressure. Her regular pressure will be 110 pounds. The run from Watch Hill to Point Judith—a distance of 20 miles—was made in one hour, and the engineers declared that even then the steamer did not develop within 800 of her horse-power."

## MANUFACTURING.

### Iron and Steel.

A press dispatch from Youngstown, Ohio, under date of the 24th inst., says: "The findings of Theodore Hall, to whom was referred the application of Dan P. Ellis and others for the dissolution of Brown, Bonnell & Co., were filed to-day. The referee was appointed in 1884, and the amount involved is \$2,000,000. Referee Hall finds that it would be beneficial to the stockholders if the corporation should be dissolved and its affairs closed up. The delay in the rendering of the decision was done with the hope that before this time the corporation would have been able to discharge its obligations fully."

The nail factory of the Kelly Nail and Iron Company, at Ironton, Ohio, is not in operation at present.

Gordon, Strobel & Laureau, Limited, of Philadelphia, have just closed a contract with the Belmont Nail Company, of Wheeling, W. Va., for a third Gordon, Whitwell-Cowper fire-brick stove.

Carnegie, Phipps & Co., Limited, of the Homestead Steel Works, at Homestead, Pa., have succeeded in turning out 24-inch beams. The new beams are for Cramp & Sons, shipbuilders, and are to be used in the construction of one of the Government's new cruisers.

The Emaus Pipe Works, at Reading, Pa., are at present filling an order for 400 tons of 3-inch cast-iron water-pipe for shipment to South America. The works are running to their full capacity. The owners had contemplated the enlargement of their plant this summer, but they have now decided not to make any changes until the present general business stagnation has changed very materially for the better.

The entire plant of the National Tube Works Company, at McKeesport, Pa., is in full operation and is turning out about 86 carloads of pipe every 24 hours.

On the 26 ult. the Swindell & Smythe Company, engineers and contractors, of Pittsburgh, received a contract for the erection of a fuel gas plant, consisting of a fuel gas generator and the converter furnaces, from the Montreal Rolling Mills Company, of Montreal, Canada. The first-named firm inform us that this is the first contract ever given by any concern not located in the United States for the erection of a fuel gas plant and the result of the experiment will be watched with considerable interest.

The nail factory of the Junction Iron Company, at Mingo Junction, Ohio., closed down on the night of the 20th ult. for an indefinite period.

The rolling mill of the Wheatland Iron Company, at Wheatland, Pa., which has recently been leased by some capitalists, is now ready for operations and is only waiting for orders, according to the superintendent, Thomas Woods. The large hydraulic machinery is said to be perfect

in every department. The puddling department will undergo several slight changes before being put into operation.

The nail factory of the Belmont Nail Company, at Wheeling, W. Va., closed down on the 24th ult. for an indefinite period.

The assignee of the Reading Iron Works has issued orders to start up the large pipe mill of the company on Monday, May 5, for the purpose of finishing a large quantity of pipe which was under process of manufacture at the time of the suspension of the company.

A consignment of 1750 tons of manganese ore from Turkey, for use at the Edgar Thomson Steel Works, at Braddock, Pa., was received at Baltimore last week.

The new plant of the Latrobe Steel Works, at Latrobe, Pa., is rapidly approaching completion, and will be ready for operations at an early date. The following are the officers of the new concern: Marriott C. Smyth, president; Walter H. Bryant, secretary and treasurer; Guillaem Aertsen, manager; and Julian Kennedy, chief engineer. Previous to going to Latrobe Mr. Kennedy was located at the Homestead Steel Works, of Carnegie, Phipps & Co., Limited, at Homestead, Pa.

No. 2 furnace of the Pennsylvania Steel Company, at Steelton, Pa., is idle at present undergoing extensive repairs. It will be ready for blast at an early date.

Work on the new plant of the Youngstown Bridge Company, recently organized at Youngstown, Ohio, will be pushed to completion as rapidly as possible. J. M. McDonald, formerly with the Morse Bridge Company, is supervising the erection of the works.

The foundations for the new rod mill now in course of erection by the New Castle Steel Company, of New Castle, Pa., are almost completed, and it is expected that the plant will be ready for operation early in August next. About 150 tons of wire rods will be turned out every 24 hours, about half of which will be used by the New Castle Wire Nail Company, of that place, the balance being sold in the open market. The works will give employment to about 100 men.

We are informed that the report that the nailers in the employment of the Bellaire Nail Works, at Bellaire, Ohio, had concluded to accept a reduction of 35 per cent. in their wages and resume work is without foundation. The nail factory of this firm has been idle for some months, and will not resume operations until there is a decided improvement in the nail trade.

The Sharon Steel Casting Company, of Sharon, Pa., are about to commence the erection of an open-hearth steel-melting furnace, which when completed will add considerably to the capacity of the plant. The firm report that they are enjoying an excellent trade.

The plant of the Stony Creek Iron Company, Limited, at Norristown, Pa., which, for the past few years, has been running spasmodically and has been idle since early last fall, resumed operations on Tuesday, the 23d ult., giving employment to about 200 men. This was brought about by a proposition advanced to the Stony Creek Iron Company by many of their old and most trusted employees, and accepted by the company. An agreement growing out of the proposition has been signed by the firm and most of the men. Under this agreement a scale of wages has been adopted, based on the selling price of iron. The men are to be informed as to

what the company receive for their product, and for every increase of \$2 per ton in the selling price the men are to receive a proportional increase in wages.

The strike at the plant of the Allegheny Bessemer Steel Company, at Duquesne, Pa., mention of which was made in these columns last week, still continues with but little prospect of an early settlement. Thus far there has been no outbreak, but trouble is liable to occur at any time. The officials of the company called on the Sheriff of Allegheny County for protection from the strikers and a detail of officers was sent to Duquesne from Pittsburgh, and are now guarding the works. It is said that several attempts have been made to start up a portion of the mill, with only partial success. At this writing every department of the works is idle. At a meeting of the stockholders of the company, held in their office in Pittsburgh last week, the old board and officers, consisting of E. L. Clark, president; H. P. Smith, secretary and treasurer; William G. Park, Robert B. Brown and D. E. Park, were re-elected.

The Cherokee Land and Iron Company, of New Birmingham, Tex., have been re-organized, a new company with an increased capital being formed under the name of the New Birmingham Iron and Land Company. The following officers and Board of Directors were elected: Mr. H. H. Wibirt, of New York, president and treasurer, and Mr. R. L. Coloman, first vice-president and general manager. The Board of Directors comprises H. H. Wibirt, of New York; R. L. Coleman, of New Birmingham; W. H. Hamman, of Calvert, Tex.; A. B. Blevins, of New Birmingham; Thomas G. Utley, of New York; John C. Hertle, of New York; O. H. LaGrange, of New York; Charles B. Wibirt, of New York, and Henry T. Kent, of St. Louis. The new blast furnace is to be pushed vigorously, and the drawings for a rolling mill are being prepared. A railroad is to be built from New Birmingham to the International and Great Northern Railroad.

### Machinery.

Stewart, Corsey & Co.'s iron foundry, at Wichola, Kan., was burned on the 18th inst.; loss, \$50,000.

The valuable machinery of the Harlem Electric Light Company, in East 122d street, was destroyed by fire on Thursday night. The entire loss is about \$125,000.

We have received from the Chattanooga (Tenn.) Machinery Company a catalogue showing their special saw-mill and wood-working machinery, and also the steam pumps, engines and supplies made by them. The catalogue is illustrated by clear engravings, accompanied by brief descriptions of the construction and operation of the many machines shown. The price of each machine is given.

The Williams Engine Works are to have a Shaw electric traveling crane for their new shops at Beloit. It will have a span of 40 feet and be proportioned for a working load of 15 tons, but is to sustain a test load 50 per cent. in excess of this, or 22½ tons, without injury. It is being built by E. P. Allis & Co., of Milwaukee, who have had one of these cranes of 25 tons' capacity in operation in their foundry for several months.

### Hardware.

Henry Diston & Sons, Philadelphia, Pa., are running full time with a force of over 2100 hands, and are turning out 400 dozen of handled saws daily, besides circulars, cross-cuts, &c.

The Gulf Wire Company have been organized in New Orleans for the manufacture of fence wire and wire goods. Of this

company Maximilian Herrmann is president; John M. Wiemann, vice-president, and Fred. Peters, treasurer. The works are located at the corner of St. Joseph and South Peters streets, and operations have been commenced.

The Putnam Nail Company, Boston, Mass., are making large additions to the works at Neponset, which will double their capacity. They recently shipped to San Francisco, Cal., four carloads, aggregating nearly 50 tons, of Putnam nails. This is probably the largest shipment of horse nails ever made, on *bona fide* orders. Mr. Ed. Brubaker, who is now on the Pacific Coast, was largely instrumental in bringing about this consignment.

The Water Elevator Purifier Company, of Cincinnati, report that their trade has increased over 100 per cent. during the year past; they are now about 1200 pumps behind their orders, while orders continue to come in. Many complimentary letters are being received daily from their agents testifying to the appreciation of the many new improvements recently added to the business.

#### A New Furnace Company.

The Monongahela Furnace Company has recently been organized at Pittsburgh during the present week. The stockholders of the new company are identified with the National Tube Works Company, of McKeesport, Pa., although in every respect the new concern is an independent corporation. The following is a partial list of those interested: David W. Hitchcock, Edmund W. Converse and William S. Eaton, of Boston; John H. Flagler, E. C. Converse, of New York; C. I. O'Connor, Horace Crosby and J. R. Jackson, of Pittsburgh. As soon as the charter has been granted, an organization meeting will be called, at which the necessary officers will be elected. At the present time nothing definite has been settled concerning the details of the organization. It is the purpose of the company to erect two blast furnaces on property recently purchased in McKeesport, in close proximity to the plant of the National Tube Works Company. They will be models of their kinds as to size, construction and equipment, and will be fitted up with all the latest improvements and will, no doubt, upon their completion, rank among the finest-equipped blast furnaces in the country. While the exact dimensions have not as yet been decided, it is expected each one will turn out about 175 tons per day each.

The greater part of this product will be consumed by the National Tube Works Company and other industrial establishments in McKeesport, while the balance will be sent to Pittsburgh and other points. The construction of the furnaces will be commenced in a short time, and they will, in all probability, be ready for operations at the close of the present year. As soon as the organization is completed, they will acquire possession of the Edith Furnace Company, of Allegheny City, Pa., who have been operated during the past three years by a corporation consisting of the following named gentlemen: John H. Flagler, E. C. Converse, J. R. Jackson, Horace Crosby and C. I. O'Connor. The Edith Furnace, under the management of the above named gentlemen, who are the owners and constitute the board of directors, has been a very successful plant, and these directors will occupy corresponding positions in the new enterprise, so that the Monongahela Furnace Company, while seemingly a new organization, nevertheless starts out under the guidance of directors thoroughly experienced in the business. We are advised that an arrangement has been made with

the different lines of railroads entering McKeesport, by which that place has been taken into what is known as the Pittsburgh district, and will secure the same rates on stock as are granted to all furnaces in the Pittsburgh district. This is an important concession and will allow the company to compete in the open market with Pittsburgh concerns.

#### Freight Matters.

The freight agents of the various railroads having connections with Pittsburgh have decided on the rail and lake rates from that city to the Northwest. To St. Paul, Minneapolis, Stillwater, &c., by way of Cleveland and Duluth, the rates are 81½, 72½, 52½, 35, 29 and 24. Articles of iron and steel manufacture in less than carloads take a rate of 29 cents; in carloads, 27 cents; railroad supplies in carloads, 21½. The new rates went into effect on Monday, the 29th ult.

The freight agents of the railroads having connection with Youngstown, Ohio, have reduced the pig-iron rates to and from Mahoning Valley points. The new pig-iron rates to Cleveland and Akron from these places are 60 cents for cinder and 65 cents for pig iron. The rate on cinder from the valley points to Pittsburgh has been reduced from 65 cents to 60 cents, and pig-iron from 80 cents to 65 cents. The rates to Uniontown and Scottsdale will be \$1.30 for scrap iron, blooms, &c., and \$1.15 for pig-iron and muck iron. These rates went into effect May 1.

The Union Pacific Railroad Company have made arrangements to receive Pittsburgh freight for Tacoma, Seattle, Port Townsend and Victoria, B. C., direct. They wish shippers to route shipments via Union Pacific Railroad, Oregon Railway and Navigation Company and steamer from Portland. This gives new competition with the Northern and Canadian Pacific Railroads.

#### Ancient Monopolies.

The Canadian *Law Times* prints an edict issued in 473 A. D. by the Emperor Zeno to the praetorian prefect of Constantinople (Code iv, 59):

We command that no one may presume to exercise a monopoly of any kind of clothing, or of fish, or of any other thing serving for food, or for any other use, whatever its nature may be, either of his own authority, or under a rescript of an emperor already procured or that may hereafter be procured, or under an imperial decree or under a rescript signed by our majesty; nor may any persons combine or agree in unlawful meetings that different kinds of merchandise may not be sold at a less price than they may have agreed upon among themselves. Workmen and contractors for buildings and all who practice other professions, and contractors for baths, are entirely prohibited from agreeing together that no one may complete a work contracted for by another, or that a person may prevent one who has contracted for a work from finishing it; full liberty is given to any one to finish a work begun and abandoned by another without apprehension of loss, and to denounce all acts of this kind without cost. And if any one shall presume to practice a monopoly, let his property be forfeited and himself condemned to perpetual exile. And in regard to the principals of other professions, if they shall venture in the future to fix a price upon their merchandise, and to bind themselves by agreements not to sell at a lower price, let them be condemned to pay 40 pounds of gold. Your court shall be condemned to pay 50 pounds of gold if it shall happen through avarice, negligence or any other miscon-

duct that the provisions of this salutary constitution for the prohibition of monopolies and agreements among the different bodies of merchants shall not be carried into effect.

H. C. Frick, chairman of the H. C. Frick Coke Company and Carnegie, Phipps & Co., Limited, of Pittsburgh, has transferred to the H. C. Frick Coke Company his individual interest in a tract of coal land, south of Uniontown, in Fayette County. The property consisted of one-eighth interest in 1690 acres and his one-twelfth of 1020 acres of coal, for which the price paid was \$70,870.15.

John D. Wick, formerly of Wick, Arms & Co., Youngstown, Ohio, has connected himself with the sales department of the Calumet Iron and Steel Company of Chicago.

Lieut. Jacob J. Hunker, U. S. A., Supervisor of the Harbor, has moved into his new office in the Army Building, in Whitehall street.

Minister Palmer, who is about to sail for Spain, was honored by a banquet in Detroit Tuesday night.

Judge Yates acted an honorable part in voting for the Fassett Prison bill and expressing his commendation in words.

The formal opening of the Engineers' Club took place on Saturday, April 27, at the club house, 10 West Twenty-ninth street, New York. The building is one of the old-fashioned large dwellings and is admirably adapted to club purposes. The new club has simple but elegant appointments and promises to become very prosperous. The membership now exceeds 350, of whom about one-half are residents of New York and its suburbs, while the non-resident members include engineers from all parts of this country, Canada, Mexico and South America. The following officers were elected: James A. Burden, president; W. R. Towne, of Stamford, and James C. Bayles, vice-presidents; A. C. Rand, treasurer, David Williams, secretary, in whose absence C. Kirchoff, Jr., acts as secretary *pro tempore*, and the following managers: F. S. Witherbee, of Port Henry, N. Y.; J. F. Holloway, W. A. Perry, Prof. T. Egleston, J. C. Platt, Jr., Waterford, N. Y.; William Metcalf, of Pittsburgh, Pa.; Andrew Carnegie, C. E. Emery, Dr. R. W. Raymond, Edward Cooper, F. R. Hutton, B. S. Church and Charles Macdonald.

Ex-Governor Pillsbury, of Minnesota, has given \$150,000 to the State University to establish a Hall of Science.

John C. New, Consul-General to London, has taken his departure.

Robert P. Porter, Commissioner of the Census, has entered upon his duties.

The Canadian Premier, Sir John Macdonald, replies to a deputation applying for railway subsidies, that the state of the public finances demands caution, and he intimates that the day for generous subscriptions has ended.

The Solid Ingot Company, of Newark, N. J., have sent out photographs showing admirably the fracture of steel ingots cast by their method, and contrasting them with ingots cast in the old style.

# The Iron Age

New York, Thursday, May 2, 1889.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.  
CHAS. KIRCHHOFF, JR., - EDITOR.  
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.

JOHN S. KING, - - - BUSINESS MANAGER.

## The Western Iron Trade.

For several years the month of April has not been characterized by an active condition of business in the West. But each year there were peculiar circumstances affecting the consuming interests and interfering with trade prospects which were thought exceptional in their nature. For instance, in 1886 the eight-hour agitation was a very prominent factor in unsettling business enterprises, in 1887 the railroads precipitated a condition of chaos by their rearrangement of freight rates in order to comply with the provisions of the Interstate Commerce act, and in 1888 the railroads were again charged with causing an unsatisfactory state of trade by their controversies with their employees. In each case the opinion was generally entertained that if the special disturbance had not occurred there would have been a fair volume of business and prices would not have dropped. This year, however, the exceeding quietness of trade cannot be ascribed to any such specified cause, yet the dullness is much more profound and far-reaching than during the periods previously cited. There are no strikes in progress which affect any considerable number of workmen, and even the threatened strike of Chicago carpenters for a uniform working day is having no effect on the local trade of that city. Of course the dullness must be accounted for in some way, and the railroads afford a convenient scapegoat. They are purchasing very sparingly, and as long as they are so economical business must perforce be dull.

Assuming that this view of the case is thoroughly sound, especially as it is so well fortified by corroboratory circumstances, it simply puts April of this year in line with April of last year and of the year before, and so on. No matter what the cause may be, April seems predestined to be a dull month, whether one thing or another must happen to make it such. We ignore the fact that February and March were months of reasonable activity in iron circles, even though the railroads were buying as sparingly then as in April. With the quietness of previous corresponding periods intensified this year, the month of April has seen lower prices for most iron and steel products than were ever before known in the West. Competition between sellers has been very bitter, notwithstanding the comparative insignificance of the prizes contended for in the shape of small orders. At present writing there is less business transacting in heavy material than at any time of the year for several years, and prospects are not bright for a speedy improvement.

But what of the future? It is on just such a condition of affairs as now obtains that the foundations for a rapid appreciation of values are laid. Manufacturers get discouraged and withdraw from a business

in which they are merely wasting their substance instead of increasing their accumulations. A movement of this kind has already begun, and the voluntary withdrawals are accompanied by others whose retirement has been hastened by legal process. A continuance of this depression throughout May and June would result in such a decided restriction of production that the supply would be found unequal to the demand, and the usual after-harvest activity in all branches of business would send prices upward with a bound.

Considering the excellent financial condition of the country, the abundance of unemployed capital, the absence of disturbing influences generally, and the progressive nature of our people, it is impossible that trade should continue to go from bad to worse until we reach a finality of universal ruin. The downward course will be checked, and will probably be checked very suddenly, as is the case with all reactions. Then there would be danger of a "boom," which is to be feared and if possible avoided. The boom of '79-'80, with its wild excesses and extravagant transactions, was a serious blow to legitimate business whose effects were felt for years. We desire and need prosperity, but not of such a violent character. Yet with all the dullness existing at present, this prospect looms up in the future. If the railroads are really as bare of necessary supplies as they are represented to be, and are in as great need of track materials and rolling stock as is reported, they will all be in the market about the same time and their purchases will enormously stimulate trade. It is a time for caution and conservatism by manufacturers, particularly in making contracts for long-time deliveries. Materials of all kinds are low, wages in Western mills are not likely to undergo any change of consequence, and it appears altogether incredible that six months from to-day the prices now prevailing will seem high.

## Uniform Freight Classification.

There is one subject of importance to all business interests which has not yet received much public discussion. We allude to compulsory uniformity in the classification of freight by our transportation companies. It will be remembered that Congress came very near passing a bill compelling the railroads to unite upon a classification at a date now passed. Acting upon this hint the Interstate Commission asked the various State commissioners, at their convention in Washington last March, for their opinion. The result was a resolution that "still further advance toward uniform classification of freight will promote the welfare and convenience of shippers." Thus the mercantile community seem committed to the movement through the action of those supposed to represent their interests. It is very questionable whether these gentlemen have fully considered this matter. Several members said that they were not prepared to state their opinion, and in the debate it was apparent that all the consequences had escaped attention. Nowhere is the meaning of the term "uniform" defined. This should have been done long ago.

There are four important classifications

now in use—the Official, between the Mississippi and the seaboard, north of the Ohio; the Western, west of the Mississippi; the Southern, south of the Ohio, and the Transcontinental, for Pacific Coast traffic. Other State or local classifications are also in use within limited areas. These classifications, while having many points of resemblance, differ radically in very important respects, and it is precisely these differences which are aimed at because they affect great staples. These classifications have in process of time come to cover sections of the country which have uniform business methods with similar manufacturing or agricultural products. Hence, as we would expect, we find these articles of traffic, which are native to the territory, given special consideration in each of these classifications, such special rates not being granted in any of the others. This is natural and proper. Cotton, for example, that great Southern staple, receives a special rate south of the Ohio, a favor not found in the Official classification except in competition with Southern routes. California raisins are brought to New York at rates which the railroads are not willing to accept on their general shipments of that article. If "uniform classification" means that the classes or rates ruling in one section must be made the basis of rates everywhere in the United States, then every merchant whose business depends directly or indirectly upon the prosperity of his State and upon obtaining the best prices for its special product must be prepared for misfortune.

There is another point. Under the present system any industry temporarily depressed may find help from the carriers who are most dependent upon its prosperity, a help which must be denied if the reduction were to affect every local road hundreds of miles away. We have had something to say of late upon the necessity of a reduction of freight rates upon iron in the States east of Chicago. But it does not follow that such reduction when made should be accompanied by a similar reduction west of that city. The competition of Pittsburgh and Birmingham with Chicago furnaces is reason enough for a lowering of rates to that city. But west of Chicago no such competition exists, and there is no necessity as yet for any changes. But if the principle of "uniformity" is to be rigidly enforced and reductions east are to be followed by reductions west, it is easy to see that the difficulty of securing any changes, however just, is immensely increased. Must the shipments from any large center like Pittsburgh be governed as to rates by the needs of a little local road for exceptionally high classification or tariffs? And if uniform classification does not mean this, what does it mean? Any single exception allowed would destroy the uniformity and bring on confusion even greater than now.

The whole supposed need for uniformity is founded on a misconception—that differences are of themselves to be condemned. On the contrary, discrimination between persons and things lies at the bottom of all trade. In business these discriminations adjust themselves, but in transportation we must adjust them on a theoretical basis, but they are not of themselves wrong or unjust on that account. Discrimination in classification or in freights between dry goods and pig-iron is ap-

proved by every one. Upon the same ground the Southern classification is right in favoring cotton and the Pacific upon raisins. In like manner low rates on iron in Pennsylvania are more necessary than in Montana. The one is a section where small profits are the rule, in the latter large profits are common, and the same condition is naturally reflected in the tariffs and classifications. It would do violence to business principles to have our railroads compelled to go out of touch with the industries they serve and thus to classify lower in Montana and higher in Pennsylvania.

Under these conditions a committee is now at work trying to unite all differing classifications into one. They find it very difficult, but are still at work. It is high time that the business community took an interest in the question. A definition of terms should be asked of the Interstate Commerce Commission, and with this before them, our merchants should carefully consider whether the commerce of the country would be helped or injured by an enforced uniformity of classification and of freight rates based upon it.

### The Cost of Copper-Mining.

While everybody connected with the copper interest, either as producer, dealer or manufacturer, is forced to wait patiently for developments, the study of some of the questions affecting the future of the metal is timely. Whether or not the magnates among the mining companies, who, we are told, have at last learned to know and respect one another, will succeed in reaching some basis with the financiers who were caught, is a matter concerning which no forecast is possible. The greed of one or the pride of another may upset the fondest hopes of those who believe that an adjustment is possible. The difficulties are so great, complicated as they are by personal motives and interests, that very many well-informed men scout the idea that a *modus vivendi* will be found. Even if something is finally patched up, it must be very radical indeed if it is to inspire confidence. The history of the past year has pretty thoroughly proved that it is a very costly matter to hold the market above its natural level. It is clear that it would be folly even for a Rothschild to keep prices at a point that would encourage a liberal supply and at the same time hamper consumption even slightly. Throughout the trade little sympathy will be wasted either on the mining companies or on the bankers whose eagerness for commissions put them into the uncomfortable position of being holders of copper. Both have reaped what they have helped to sow, and while the companies may contemplate last year's balance sheets with satisfaction, the net returns for the next two or three years may finally raise some doubts as to the wisdom of having allowed themselves to be inveigled into a false move by reckless speculators.

In all the discussion which is now going on one fundamental error seems to have a strong hold on producers and bankers, and that is that within certain limits they possess the power to establish a price. They all concede that M. Sécretan made a fearful blunder, but the conviction seems to be that his cornering operation failed, not because it is impossible to control the market, but because he was altogether too liberal to the mining companies and at-

tempted to extort too high a price. They say, practically, that the thing cannot be done at 16½ cents a pound with unlimited production, but it can be done at 12 cents with a limited output. They assume that the attitude of the seller settles the matter, and seem utterly indifferent to possible effects produced by hostility on the part of the buyers and the trade. The latter, too, may have formed their convictions, and though their voice is not heard in the councils of the magnates, their influence will quickly be apparent in the course of the market.

A point which producers often raise when discussing the question of prices is that the average for a series of years should be accepted as representing the normal value. We believe that view to be erroneous, especially so far as this country is concerned. Ten years ago a few Lake mines controlled the market, and sustained it by exporting a small surplus at a sacrifice. Since then our production cannot be managed by any such methods. Since then costs have been reduced by improved mining methods, by the introduction of more efficient crushing, dressing and smelting appliances, by the lowering of the cost of fuel and supplies, and by cheapening of transportation.

Let it be conceded that to some extent the greater depth of the mines offset this lowering of cost; still a balance remains. We contend that the cost of production to-day, plus a fair profit, an allowance for repairs to machinery and new construction, and a sinking fund to cover exhaustion of deposit, represents the normal price. Under present circumstances that price must be the maximum, because in some way a part of the accumulated stock must be marketed. So far as the Lake mines are concerned the bare cost of production is easily arrived at. The annual reports of a number of companies allow us to figure it out quite closely. The Tamarack, the young neighbor and rival of the Calumet and Hecla, reported on June 30, 1888, that the cost of its copper laid down in New York, all expenses paid, was 5.75 cents. Including all expenses for construction and for development work the cost was 7.20 cents a pound, based on a yield of 3.6 per cent. of ingot. The figures for the Calumet and Hecla are not known, but its rock is nearly 1 per cent. richer and its operations are on a much grander scale, so that its cost should certainly not be so high, in spite of heavy outlays for new construction and development. For the other leading mines we have the figures for 1888 as follows:

	Product.	Gross expenditure.	Cost per pound.
Franklin.....	3,655,751	\$406,583.02	11.12
Oscoda.....	4,134,320	479,873.42	11.61
Quincy.....	6,387,809	500,860.24	7.86
Atlantic.....	3,974,972	435,683.93	10.96
Central.....	1,817,023	196,605.55	10.76

Of course during 1888 the majority of the mines went into exceptional expenditures for new machinery and development. All of them pushed their output vigorously, and a tendency was observed to handle lower grade rock, since it yielded a profit at high prices. On the basis of the figures given, a good profit could be realized by the Calumet and Hecla with an output of about 50,000,000 pounds, the Tamarack, which is producing at the rate of 15,000,000 pounds, and the Quincy, which may be placed at 6,000,000 pounds, a total of 71,000,000 pounds of ingot.

We possess little public information concerning the capacity of the Montana mines to meet low prices. The annual report of the Boston and Montana Company, at Butte, showed that the running expenses were \$740,714.32 on a product of 8,815,987 pounds fine, an average of 8.41 cents. Including construction and a payment for mining and smelting property purchased, the outlay was \$931,667.48, or 10.59 cents per pound. But the mine is now producing at the rate of 2,000,000 pounds a month, so that 9½ cents for casting brands is not likely to close it down. The Anaconda, with a product of 60,000,000 pounds, has leaner ores, but this may be compensated for by working on a very much greater scale. These two must depend upon the limited capacity of domestic refineries to convert their matte into merchant copper. A considerable part of the matte must be exported, and therefore will depend upon the English market. The Parrott, with a product of about 10,000,000 pounds, has its own refinery at Bridgeport and has close relations and a good trade in the Naugatuck Valley. Its capacity to meet low prices is not doubted in the trade.

In Arizona, companies representing an output of about 15,000,000 pounds would certainly continue at 9½ cents, and with their well-known reputation for quality would receive the preference over other brands. Assuming that the Lake, Arizona and Parrott copper remained at home and that one-half of the Anaconda and Boston and Montana were refined for the market, the supply to it would be 138,000,000 pounds of new copper, certainly enough to cover all our home requirements, and leave 42,000,000 pounds for export. In other words, three mines each in the Lake, Montana and Arizona districts could sell at 9½ and 10 cents respectively, running at a moderate rate, and leave a profit to their owners. To these concerns a 12-cent market would yield very handsome profits, while it would give life to a number of second-rate producers.

### Iron Railroad Ties in Germany.

The efforts being made in this country, feeble as they are, to introduce iron as a substitute for wood for railroad ties may be prejudiced by the developments in Germany during the past few years. That country was the first to introduce the use of steel sleepers on a large scale, and was followed later by the railroads in other Continental countries, in Great Britain and in India. For some time past, however, the authorities—the greater part of the German railroads being operated by the State—have turned back to wood as a material. This movement has been viewed with much alarm by German ironmasters, and has resulted in a vigorous agitation on their part. At the last meeting of the Association of German Ironmasters H. Brauns, the general manager of one of the leading steel works of the country, presented a paper containing many interesting data. Its general tone and the arguments advanced are characteristic of appeals made to a paternal government. He seeks to establish the justice of his cause by pointing out that German interests are injured by substituting for steel ties, on which the State railroads secure income by hauling raw materials, wooden ties, a large proportion of which must be imported, because the forests of Germany cannot cover the whole demand. He estimates that 1,800,000 wooden ties are im-

ported. Taking about 110 pounds as the weight of a steel sleeper, they displace a possible consumption of 90,000 tons of iron. The freights on ore, coal, limestone, &c., to produce this quantity in the Rhenish provinces and Westphalia will average 15 marks, equal to a loss of gross earnings to the railroads of 1,485,000 marks. The wages, which will average 37.50 marks per ton of product, add 5,568,750 marks more of which national industry is robbed. All this money, Herr Brauns urges, should be kept in the country.

The statistics showing the quantities of wooden and iron ties put into the track of the Prussian State railroads and of all the German roads are well calculated to create uneasiness, the figures for a few years being:

Wooden and Iron Ties put Into Track. Prussian State Railroads.					
Year.	Wood. Number.	Iron. Number.	Per cent.	Per cent.	
1885-86.....	1,507,363	672,086	69.16	30.84	
1886-87.....	1,582,877	522,470	75.18	24.82	
1887-88.....	1,654,304	498,628	77.02	22.98	

All German Railroads.  
1885-86..... 2,482,004 1,007,152 70.97 29.03  
1886-87..... 2,544,992 868,262 74.56 25.44  
1887-88..... 2,677,424 750,670 78.10 21.90

The figures clearly show that steel ties are losing ground absolutely and relatively, and that the Prussian State railroads are taking the lead in what the ironmasters call the retrograde movement, since their proportion of the whole, which was 66.7 per cent. in 1885-86, fell to 65.7 per cent. in 1887-88. The estimates of the administration of the Prussian railroads indicate that they propose to persist in the same direction, since the budget calls for an expenditure of 9,810,220 marks for wooden ties, against only 4,168,886 marks for iron sleepers. The estimate for 1889-90 includes 33,514 tons of sleepers, while it calls for 78,770 tons of rails and 24,247 tons of fastenings, figures which show how important this matter is to the iron works.

During the discussion which followed Herr Brauns' paper no points were touched which might throw light upon the reasons for the change of policy on the part of the railroads. It is somewhat difficult to understand how a revulsion of sentiment among German railroad engineers can have taken place without good and sufficient reasons, from their standpoint. One fact, however, was brought out, which is certainly surprising. It appears that the administration of the Prussian State roads estimate the life of steel sleepers and ties at 15 years, or the same as that of oaken ties. Exact data are, of course, wanting, because a sufficiently long period has not elapsed to furnish figures upon which the life of steel ties can be even approximately estimated. Still, it appears utterly contrary to all experience to assume that a steel tie, subject to no wear, should not long outlast a rail, the life of which under ordinary conditions often far exceeds 15 years.

One of the speakers submitted data relating to the cost of steel ties as compared with oak, which we tabulate as follows:

Cost of Ties in Germany, in Marks. Steel.					
	1.	2.	3.	4.	5.
Tie-weight, kg.....	54.2	53.0	57.0	53.0	57.0
Tie.....	8.39	6.25	6.72	6.25	6.72
Hook plates.....	1.19	1.19	1.19	1.19	1.19
Fastenings.....	0.71	0.40	0.40	0.74	0.74
Totals.....	7.10	7.84	8.31	6.99	7.46
Value as old material.....	2.77	2.92	3.12	2.78	2.98
Net.....	4.33	4.92	5.19	4.21	4.48

All the ties are placed at a cost of 118 marks a ton, equal to, roughly, \$28 a gross ton, while the oak ties cost about \$1 apiece. In this country steel ties can be contracted for on a large scale at the rate of about 2 cents per pound, one of the leading concerns in Pittsburgh having agreed to deliver the finished tie at that rate. Still, the prospect of their introduction on a large scale in this country is not very promising as yet. Very few of our railroads are in a position to carry along as an asset any heavy quantity of steel for its possible value as old material in decades to come.

#### Our Trade with American Nations.

The Bureau of Statistics at Washington has just published details of the trade of the United States in 1888 with other American countries as compared with the previous calendar year. We have used those particulars for extracting therefrom a table showing—reduced to thousands of dollars—the trade, in merchandise only, done with countries situated south of us, and another grouping together the Northern countries. The percentage of gain in our domestic export southward is highly gratifying, inasmuch as it has amounted to 8 per cent., the increase of import being 4 per cent. On the other hand, the export to Northern countries hardly shows any gain at all, the import thence increasing 9 per cent.

The conclusion arrived at from the results disclosed by these comparisons is that the rise in coffee and sugar, as well as temporarily in hides, has increased the purchasing capacity of countries south of us so much last year that they have absorbed American products more freely. A gain of 8 per cent. in a single year is not a small matter, and encourages the very best expectations for the current year, in which sugar has so far advanced in a manner almost unprecedented. This advance will encourage the planters to extend their estates and enlarge their capacity of production by ordering more American machinery, &c. Should, on the other hand, our own crops be as abundant as they promise at this early stage, it will cheapen our flour, provisions and canned goods, and the bulk of what we shall ship southward during the latter half of 1889 will be all the greater. Since our export to Spanish America and Brazil is to be pushed this year with renewed vigor, everything will co-operate, we trust, to give as favorable results as those exhibited, perhaps even more brilliant ones, although another similar percentage of increase would no doubt fully satisfy our exporters and manufacturers.

Mr. Charles R. Stowell, bridge engineer of the New York Railroad Commission, has prepared a complete list of the railway bridge failures of last year, so far as reported, with the name of the road and circumstances attending each. The number of such failures in 1888 was 32, of which 1 was by fire, 10 by freshets, 3 while undergoing repairs, 6 were knocked down by trains, 5 were square falls, and 7 failed from unknown causes. Mr. Stowell also has statistics covering failures for ten years past, omitting the first two years, for which the record is presumably imperfect, 239 bridges having fallen in eight years, or within a fraction of 80 per year. In the meantime, however, the railway mileage has enormously increased—from 93,349 at the beginning of 1880 to 149,913 at the beginning of 1888, an increase of 60½ per cent. When this is considered the record of failures shows a gratifying decrease.

### Freights in the Lehigh Valley.

Alleged discrimination in freight rates in the Lehigh Valley is the subject of grievous complaint. A prominent iron manufacturer in an interview said that Reading and the entire Schuylkill Valley is being discriminated against by the railroad companies; that this discrimination extended to all the inland cities and manufacturing towns, with the result of driving trade to the seaboard. He characterized it as a short-sighted policy which, if continued, would kill trade in and about Reading altogether. The excessive freight rates, he thought, had as much as anything to do with the failure of the Reading Iron Works. He said: "All the rates of the railroad companies are now being made in favor of the long haul. When we complain of this they answer us that they cannot lower local rates one particle without losing money, for the reason that every ton carried on a long haul entails an actual loss. Such action does not display any ability, for it simply crushes out local trade, reducing their business on short hauls. It is killing the goose that lays the golden egg. Our rates in this city and this valley are so high that it is impossible to manufacture at a profit. The freight on coal and iron on short hauls is 2 and 3 cents per ton per mile, while on long hauls it is from  $\frac{1}{2}$  to 1 cent. For Southern iron the rate is  $\frac{1}{2}$  cent per ton per mile, and I know one furnaceman in the South who has a contract for ten years at  $\frac{1}{2}$  cent per ton for both long and short hauls. At our rates it is impossible to compete with these people. Two weeks ago the Lehigh Valley and Philadelphia and Reading railroad companies lowered their rates to Philadelphia, New York, Buffalo and other large markets, but our local rates have not been touched. From the Schuylkill coal fields to this city the tolls on coal are 80 cents to furnacemen and \$1.40 for domestic consumption. All manufacturers, except furnacemen, must pay the domestic rate. The haul from the Lehigh coal fields to Bethlehem, Allentown and Catasauqua is no longer than from the Schuylkill region to this city and yet the rates are 20 per cent. lower. The furnace rates to these places are 65, and the domestic rates \$1.10 and \$1.15. The toll on a ton of coal to Philadelphia is but 40 cents a ton more than to this city. This discrimination against Reading is slowly but surely closing our factories, and if it continues will deal a death blow to all our industries." This is a fair reflection of the sentiment of all the manufacturers of the Schuylkill Valley on this subject. These complaints extend not only to the local rates on coal ores and iron, but to the policy which leads to the carrying of manufactured goods to New York, Philadelphia and other markets from points of production much further away at rates either absolutely less in amount or much less in proportion to the distance.

Sunday freight trains are being discontinued so far as practicable on the Vanderbilt lines as well as on the Pennsylvania road. The new arrangement will take effect May 1, comprising all the Vanderbilt lines east of Chicago. Live stock and perishable freight will be forwarded as usual to its destination. The company expect that when merchants learn that imperishable goods are not moved on Sunday they will calculate accordingly and ship their goods at such time as will prevent loss to either party. In like manner General Manager Hickson, of the Grand Trunk Railway, has ordered that no freight trains be run on Sunday, except those carrying live stock and perishable goods. The Delaware, Lackawanna and Western, also the Delaware and Hud-

son Canal Company are in hearty sympathy with the movement. The New York, New Haven and Hartford road and the New England road have been running, practically, no Sunday freight or excursion trains for two years.

### Wrought-Iron and Steel Eye-Bars.

Carl Gayler, discussing the relative merits of wrought-iron and steel eye-bars before the St. Louis Engineers' Club, reached the following conclusions:

The wrought-iron eye-bar has had its time; steel is rapidly taking the place of iron, and it will not be long before it has superseded iron for pins and eye-bars as completely as the steel rail has taken the place of the old iron rail—and we have no cause to regret this change. Any engineer who has had for a length of time to do with iron eye-bars, and has convinced himself, through tests, of their value, has from time to time met with a lot of bars, sometimes from the most reliable bridge firms, which gave surprisingly bad results; he has, furthermore, among a number of good eye-bars nearly always found a few inferior heads, and if he also recalls to his mind the various fractures in their heads, invariably partly crystalline, often not thoroughly welded and the layers of the piling plates discernible, he will feel little reluctance against trying a new material. The long record of tests of iron eye-bars manufactured for the more important structures of our country shows results which are anything but reassuring, and it is not too much to say that iron eye-bars made by our leading bridge companies under close inspection and with careful tests on the part of the engineer are more unreliable members than any of the rolled or built shapes used in any other part of the bridge. Steel eye-bars have doubtless their weak points also, but we have at least the satisfaction of knowing that the material which we are on the point of abandoning has never satisfied us.

In deciding on the use of steel for eye-bars we have to keep in mind that we deal with a superior, but also with a more sensitive material. To two of the sources of weakness in iron eye-bar heads, *i. e.*, to the effect of unequal heating and to that of chemical impurities, is added the effect of overheating, the proper degree of heat for steel work of any kind being of the greatest importance. The effect of unequal heating is counteracted by the annealing process—by heating the whole bar when completed, but before the final boring of the pin-holes, in a large oven, and then allowing it to cool off slowly. This annealing process is also claimed to restore to some extent the strength of the overheated metal, although I am unable to say how far this claim is justified. As far as chemical impurities are concerned, the influence of too much phosphorus is fatal. Bridge companies have found it necessary to insist on steel containing not over 0.04 phosphorus. The difference between the making of an iron and a steel eye-bar head is characteristic of the two materials. As we have seen, the former is essentially a welding and forging process; the latter is a process by which the heated metal requires merely to be pressed or made to flow into its new shape. Upsetting and shaping, both under hydraulic pressure, with such additional hammering or rolling only as is necessary for a surface finish, suffice to make the steel head. What work is to the iron eye-bar head is heat to the one of steel.

In speaking of steel it is hardly necessary to say that "mild steel" is meant, nor will it probably be disputed that the milder the steel (carbon between 0.10 and 0.20 of 1 per cent.) the more uniformly good the result. The superiority of steel

eye-bar heads, which is proved by the results of tests made so far, is to be accounted for by the homogeneity of the metal; all the doubts about a uniform thorough welding into one fibrous mass, which are so well founded in the case of the iron eye-bar head, are at once removed, and it is in reliance on this difference in favor of steel that the manufacturers, following the example set by the Edge Moor Iron Company, have begun to reduce the size of the steel eye-bar head. It appears now that the investigations and experiments on the best shapes of eye-bar heads, extended through so many years, have had their cause solely in the bad results of insufficient welding, and that in substituting steel for iron we are justified at once in using smaller heads.

The engineer who builds bridges and who, as is often the case, has no chance to visit some of the principal mills and shops of the country more than once or twice a year, may get bewildered if he considers his responsibility in view of all the requirements for good eye-bars, but the way for him is very simple. He has to insist on full-size tests of a sufficient number of finished bars, thus demanding the results from the manufacturer, who has to assume all responsibility for the success of his work, which, of course, implies that the selection of the material, the mode of manufacture and the shape of the heads have to be left to his discretion also. I wish to add here the results of full-size tests of steel eye-bars, made last year on the 1,200,000-pound hydraulic testing machine of the Union Bridge Company, at Athens, Pa., for the Grand Avenue Viaduct, now nearing its completion in this city. The steel for these bars is Bessemer steel from the Carnegie, Phipps & Co. mills, Homestead, Pa. The requirements for the specimen tests were: Elastic limit, 32,000 pounds per square inch; ultimate strength, 62,000–70,000 pounds; minimum elongation, 18 per cent., and the specimens ( $\frac{1}{2}$ -inch round) to bend 180° around their own diameter without showing crack or flaw.

The record kept at the mill of the chemical tests of each blow shows the amount of carbon to vary from 0.13 to 0.16 of 1 per cent., and that of phosphorus from 0.03 to 0.06 of 1 per cent. The eyes were made at the Edge Moor Iron Works, Wilmington, Del., with an excess of material across the eye over the bar of 40 per cent.

The Roberts Iron Works Company, of Cambridgeport, Mass., have been compelled by increase of business to begin plans for an extension to their boiler works of about 100 feet, making the building 302 feet long by 96 feet wide. The longitudinal seams of the boilers made by this company are made as shown in the following sketch, which is a plan and section through the seam:

The outside lap, through which and the shell the rivets 2 3 pass, is narrower than the inside one through which the rivets 1 1 also pass. It is evident that this construction insures the strength of the shell. Another item in the building of this boiler

is found in the stay-bolts, the bodies of which in the 6-foot boiler are  $1\frac{1}{2}$  inches in diameter, while the threaded ends at the heads are  $1\frac{1}{4}$  inches, thus reducing the weight of the bolt by doing away with useless material, without diminishing its strength. Under each nut is placed a corrugated copper washer to hold cement. All boilers made by this company are of steel, and are of ample strength for the pressure required.

### Treasury Decisions.

#### TESTS OF MARINE BOILER PLATES.

The Supervising Inspector-General of Steam Vessels, by direction of the Secretary of the Treasury, has issued the following circular governing the test of boiler plates: "Whereas, it has been reported to this office that boiler-makers in many cases prepare sample pieces of steel and iron plate for testing, varying in form from that required by the rules and regulations of the

### The Influence of Silicon on Steel.

Professor Tilden, Prof. W. Chandler Roberts-Austen and Mr. F. Turner, who were appointed by the British Association as a committee to investigate this subject, give the results of a series of experiments made in the following manner: A weighed quantity of siliceous metal was melted down in a covered crucible, and about 40 pounds of molten basic Bessemer metal taken from the ladle at about the middle of a cast were then run into the same crucible. After allowing the contents to stand for about a minute the metal was poured into another crucible, and then allowed to slowly solidify. Test pieces were cut from the different samples and submitted to mechanical tests, with the results shown in the annexed table; the chemical analysis is also appended. In the summary of the results it is observed that when silicon is added to iron containing manganese it in nowise injuriously affects the ordinary mechanical properties of the metal, provided the percentage of

ceived—that of Bradlee & Co., of Philadelphia, at whose works the cables are now being made. That these fears were unfounded was shown by a test of three links taken from a completed 2-inch cable and tested on the Watertown machine. The breaking strain was 274,200 pounds, or 10 per cent. more than was needed. The iron for these cables is made by Hughes & Patterson, of Philadelphia. It gives a good weld, is homogeneous and has the required tensile strength.

The links are welded at the ends, which are always the weakest parts, as proved by the break always taking place there. It is more than probable that the action of the Government in increasing the strength of cables will cause manufacturers to abandon the end weld so almost universally used in this country, and adopt the side weld in vogue across the water. In the end weld it is an extremely hard job to perfectly unite the inner surfaces owing to the difficulty of supporting the link on the anvil while striking. This in a great measure would

Board of Supervising Inspectors, and that inspectors receive and test the same, not deeming it their duty to object. Such officers are hereby notified that it is their duty to refuse to make tests of boiler material when sample pieces do not correspond, approximately, at least, with the regulations, and in case of the boiler-makers' failure to properly prepare the test-pieces the same should be returned without unnecessary delay, with a letter of explanation giving the reasons therefor. Boiler-makers are informed that the failure of test-pieces to come up to the standard required may be caused from improper manipulation of such pieces, and not from inherent defective qualities in the plates of iron or steel from which the test-pieces are taken, and they are cautioned that any method of cutting off the coupons for testing which requires the sample pieces to be straightened by hammering hardens the material, and is frequently the cause of samples falling short of the required reduction of area required by the rules and regulations, at the same time increasing the tensile strength to a point beyond that which the plates would show if the test-pieces were properly prepared. Coupons should never be sheared, but should be cut off with a planer or chisel. In figuring on the ductility of plate as shown by the reduction of area of section it is not deemed advisable to reject any plate for lack of proper ductility under the rules when such reduction is only a fraction of 1 per cent. short of the standard required by the rules and regulations, as perfectly exact measurement of the broken ends of samples is nearly an impossibility."

silicon does not exceed 0.5. When more than 15 per cent. of silicon is present, both the limit of elasticity and the tensile strength are increased; the extension and the reduction of area are, however, distinctly decreased by the presence of silicon.

### Increased Strength of Chain Cables.

Several important changes were made by the United States Government in the last specifications for so-called lightship cables. The most essential was that relating to the breaking strain, which was ascertained by the following formula determined by Lieutenant Mackenzie:

$$\left(\frac{\text{dia}}{4}\right)^2 1,000,000$$

This for a 2-inch cable gives a breaking strain of 250,000 pounds, which is a most decided increase over any of the requirements prevailing in Europe, the highest of which for a similar chain is that of the English Lloyds, where the breaking strain must be 225,000 pounds. The Government also required, for the first time, a breaking test of three links taken at random, and also a test of the whole cable up to one-half of the required breaking strain—that is, the entire length of cable, each of which measures 120 fathoms, must be subjected to a strain of 125,000 pounds in the case of the 2-inch. Eight lengths were called for, two each of the following diameters:  $1\frac{1}{2}$ ,  $1\frac{1}{4}$ ,  $1\frac{1}{2}$  and 2 inches. It was not certain that the requirements could be met, and but one bid for the work was re-

be obviated by the adoption of the side weld and should therefore add correspondingly to the strength of the chain.

The Chicago and Aurora Smelting and Refining Company, of Aurora, Ill., have put up a plant for electrolytically depositing copper. The other concerns working in this way are the Bridgeport Copper Company, at Bridgeport, Conn.; E. Balbach & Son, Newark, N. J.; the Chicago Copper Refining Company, Chicago, and the St. Louis Smelting and Refining Company, at St. Louis, Mo.

The accounts of the Foreign Mail Office for the transportation of mails have just been made up, to include the third quarter of the fiscal year. The increase in the quantity of mail exchanged between the United States and foreign countries is shown by the following comparison of the cost of the foreign mail service for the nine months ended March 31, 1888 and 1889:

	1888.	1889.
Transatlantic mails	\$247,744	\$265,593
Transpacific and miscellaneous	75,518	91,633
Panama Railroad	4,952	6,556
Closed mails	19,343	21,488

Total ..... \$347,557 \$385,260  
This shows an increase of 10.82-100 per cent. in the weight of the mails in 1889 over the corresponding period in 1888.

In a letter to the Collector of Customs at New York, dated April 15, 1889, the Treasury Department has held that razor blades without handles possess all the essential parts of razors, and are therefore dutiable at the rate provided for razors.

# TRADE REPORT.

## Chicago.

Office of *The Iron Age*, 96 and 97 Washington street, CHICAGO, April 27, 1889.

**Pig-Iron.**—Dealers report a quiet week, with the preponderance of business to the credit of out-of-town buyers. City consumers have their requirements well covered for the immediate future. A better feeling is noted among the local foundries, however, which is caused by an increase in work offering and in sight, but there will have to be a decided improvement in this direction to affect the Pig-Iron market appreciably. Yet sales have been made of Soft Southern Irons at a price which would not have been paid a fortnight since, which would seem to indicate a recovery from the extreme depth of the depression. On the other hand, furnace companies are deferring shipments on a very large part of the orders booked in February and March, their customers requesting this action on account of the falling off in their own business. Room exists, therefore, for a considerable increase in the consumption of Pig-Iron merely to catch up with the contracts already made. Under the circumstances prices of strong Coke Iron are barely holding their own, local brands being still available at rates with which outside Iron cannot compete. Lake Superior Charcoal Iron has been inactive, but large consumers are making inquiries on round lots, and prices will soon be tested. Cash quotations are as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16 @ \$16.50; No. 2, \$15 @ \$15.50; No. 3, \$14 @ \$14.50; Chicago and Bay View Scotch, \$16.50 @ \$17; Lake Superior Charcoal, \$19; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16 @ \$16.25; No. 2 Foundry and No. 1 Soft, \$15.50; No. 3 Foundry, \$15; Gray Forge and No. 2 Soft, \$14.25 @ \$14.50; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; ditto, lower grade, No. 1, \$17; No. 2, \$16; Alabama Car-Wheel, \$25.25.

**Bar Iron.**—The monotony of the month was relieved this week by the appearance in the market of some manufacturing consumers, who seemed to realize that prices were about as low as could reasonably be expected. One concern placed an order for 1000 tons, largely for early delivery, and others bought fair quantities. Those buyers who were holding back to get the benefit of a reduced freight rate, which they presumed would, as in previous seasons, accompany the opening of navigation, seem to have been victims of false hopes, as the officials of the railroad concerned announce that they do not propose to reduce rates from Pittsburgh and Ohio points to Chicago. Manufacturers also who were quoting prices here for future delivery, based on the expected reduction, and thus depressed values below their normal point, will have to advance their rates if they wish to realize at mill what they expected to get. Small lots from mill are still quotable at 1.60¢ @ 1.65¢, f.o.b. Chicago, half extras, for Common Iron. Store prices are 1.80¢ @ 2¢, according to quantity and quality.

**Structural Iron.**—Mill lots of Universal Steel Plates are quoted at 2.15¢ @ 2.20¢; Angles at 2.10¢ @ 2.15¢; Tees at 2.50¢ @ 2.55¢, and Beams and Channels at 2.90¢, all f.o.b. Chicago, but a stiffening tendency is developing, owing to the improved condition of the Pittsburgh mills, which have received much business recently from other sections. Beams are in fair demand here, but other classes of structural material are dull. Small lots

from store are quoted at 2.25¢ @ 2.30¢ for Angles; 2.65¢ @ 2.70¢ for Tees, and 3.4¢ for Beams.

**Plates, Tubes, &c.**—Dealers agree in characterizing the past week as the dullest of the year thus far. City trade is absolutely lifeless. Yet prices are no lower, as the mills decline to make further concessions. Quotations from store are as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 65 % off for 3-inch and over, 62½ % off for 2 to 2¼ inch, and 57½ % off for 1¼-inch and smaller.

**Sheet Iron.**—Manufacturers are steadily growing firmer in their views as their order-books fill up, and it looks now as though the quotation of 2.95¢, Chicago, for large lots of No. 27 Common would soon be advanced. Some are refusing to sell beyond July delivery, but others are not so chary of the future and have entered orders freely, covering the whole of the year. Small lots of Common from store are sold on the basis of 8.10¢ @ 3.20¢ for No. 27.

**Galvanized Iron.**—Manufacturers' agents and jobbers report a dull week. Prices are drooping, and, while quotations for small lots range from 65 % off on Juniata to 65 % and 2¼ % off on Charcoal, good buyers are having little trouble in securing more favorable terms. Manufacturers' agents insist that these low prices cannot continue long and that there must soon be a change for the better.

**Merchant Steel.**—The week has developed a renewed demand for cheap Steel, particularly from the manufacturers of agricultural implements, some of whom have taken advantage of the low prices now ruling to cover their requirements for the fall months. Higher grades are very quiet. Soft Steel Bars are quotable at 2.20¢ rates; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢; Sheet Steel, 7¢, 8¢ and 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—A few small orders have been taken since our last report, but nothing of importance has transpired. Chicago quotations continue at \$30 @ \$30.50.

**Track Supplies.**—Only occasional sales of small quantities are being made. Steel Fishplates are quoted at 1.80¢ @ 1.90¢ and Iron at 5¢ @ 10¢ less; Bolts with Square Nuts bring 2.55¢ and Hexagon Nuts 2.65¢ @ 2.70¢; Spikes are quoted at 1.95¢ @ 2¢.

**Old Rails and Wheels.**—Old Rails, both Iron and Steel, are very quiet at present. For Iron Rails sellers ask \$20, but buyers offer only \$19, so that trade is at a standstill. Old Car-Wheels are still falling in price. Consumers would probably have to pay about \$17 for them, but dealers are not willing to pay over \$16. They are being pressed for sale by parties who have become tired of holding them.

**Scrap.**—The market is flat. Consumers are not buying Wrought even in small quantities, and it is being offered to dealers at very low rates. They are paying \$16 @ \$16.50 for No. 1 Railroad Shop, and proportionate prices for other grades. There is no inquiry for cheap grades of Iron Scrap, and Steel is also very quiet. Cast is in some demand for foundry use, and best quality is quoted at \$13.50 @ \$14 net ton.

**General Hardware.**—Business is in fair condition, but by no means as active as it has been. Some jobbing houses report a marked decrease in the sales of the last three days. May is usually a good

month, but the prospects are not bright for a very heavy trade in it this year. Some specialties are in very lively demand, however. Bicycles, for instance, are moving off very freely, the supply being unequal to the demand. All kinds of summer Sporting Goods are in almost equally active request, such as Tennis Sets, Baseball Outfits, Fishing Tackle, &c. Ice-Cream Freezers, Refrigerator and other Summer-House Furnishing Goods are also selling well, but in staples there is more or less complaint of dullness. The opening of Oklahoma, which occurred on the 22d, was a boon to the Missouri River jobbers, as they were able to work off a large part of their surplus stocks of Hardware in that direction. Prices are unchanged on most lines. Agricultural Wrenches have been put at 80 % and 5 % discount in case lots, f.o.b. Cleveland, with no freight allowance.

**Nails.**—A light business is in progress, and prices are a little weaker, though no actual change in quotations has been made. The classification of Wire Nails in kegs at a higher rate of freight, which was alluded to last week, is acknowledged by railroad authorities to have been an error which will soon be corrected. Small lots of Steel Nails sell at \$2, and Wire Nails at \$2.40, with 5¢ off for mixed carloads. The Calumet Iron and Steel Company's P. C. P. Nail is meeting with a very ready sale, notwithstanding the dullness of the general market.

**Barb Wire.**—Manufacturers are being pressed to make deliveries, and prices are more firmly held, but jobbers still quote small lots of Painted at 2.80¢ and Galvanized at 3.40¢.

The Joliet Steel Company and the Union Steel Company have removed their offices to the Rookery Building. They occupy a larger part of the tenth floor, to which the North Chicago Rolling Mill Company have also removed from their former location on the seventh floor. The offices of all these companies have been arranged in such correspondence with one another that as soon as the formal consolidation is effected on the 1st of May the business of the new Illinois Steel Company will go on smoothly and satisfactorily. A very large number of offices is required to accommodate the official staff and clerical force of this large corporation.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., April 29, 1889.

The fourth month of the year is about closing on a dull a period as any that the Iron trade has experienced during the recent depression. Prices are at the lowest, and sales extremely hard to make; yet in spite of this there is a feeling of confidence that is very remarkable. The idea is that while there may not be much change until after midsummer there must be a great improvement during the fall months, presuming, of course, that nothing of an unfavorable character occurs in the meantime. This feeling is so general that the present condition of things is accepted as a matter of course, and as a necessary preliminary to ultimate improvement.

**Pig-Iron.**—The market is no better than it was a week ago. Some think it is hardly as favorable as it was at that time. Prices are unchanged, however, and really good Irons are taken without much demur. Outside brands are irregular, and in forced sales may perhaps be a trifle lower, but as a rule there is a disposition to stand out for quoted rates, or pile up Iron until the demand improves. The recent reduction in coal will help local furnaces a little, but it ought not to

affect prices, as they are already much below what they should be to allow a reasonable margin for profit to producers. Still in the event of continued pressure to place Southern Irons in this market it will allow that much more of a rebate without placing the furnace companies in a worse position than they are already in. But the disposition is to look on the bright side, although at the moment there is no doubt that Southern competition is very severe. It is difficult to find out the exact status of Southern Iron as regards the amount sold and prices realized. Some consumers report very favorably as to its quality, others the reverse, but in both cases prices have been in accordance with quality. Hence if some brands of Southern Iron are sold at, say, \$14.50 delivered for Gray Forge or \$16.50 for No. 1 Foundry, it does not follow by any means that all Southern Iron sells at low prices, or that all Southern Iron is of inferior quality. As a rule, however, \$15 and \$17, delivered in consumers' yards, are prices which local Irons have to compete with, although in some instances \$17.50 is paid for certain brands. Local brands are quoted at from \$15 to \$15.50, delivered, for Gray Forge, \$16.50 @ \$17 for No. 2, and \$17.50 @ \$18.50 for No. 1. In some quarters stocks are increasing a little, but as a rule supply and demand are very evenly balanced. There is nothing in the immediate outlook to indicate any special change, so that it may still be called a waiting market.

**Blooms.**—The market is devoid of special feature, and transactions are nearly all of a routine character, and without change in prices. Sales chiefly at about the following figures: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 1/2 "Bloom" ton of 2464 lb.

**Muck Bars.**—Quiet but firm. Holders ask \$27, delivered, for good quality Bars, with buyers at \$26.50.

**Bar Iron.**—Business is dull and prices irregular. Some little attempt at firmness was made a few days ago, and sales were claimed to be at a half-tenth advance; but so many mills have been competing for business that it is doubtful if the increased rate has become general. It is stated, however, that a fair amount of orders has been accumulated for delivery during the incoming month, and that the undertone is stronger and liable to develop rapidly if the movement once gets fairly started. But at present there is nothing like activity, and it will require a good deal of business to give all the mills as large a share as they seem to want. The absence of demand for Skelp Iron is rather severely felt, so that, whatever may be in the future, the present, at all events, is anything but satisfactory to manufacturers. Prices are nominally from 1.75¢ to 1.85¢ for Best Refined Bars, but there is so much cutting in extras that actual prices are much below nominal quotations.

**Plate and Tank Material.**—As a rule reports from the Plate trade are a little better. Business is more plentiful, and some of the leading mills appear to have all the work they can handle during the coming month. This, with the regular day-to-day trade probably means enough to last until midsummer, even though there may not be in the meantime many more large orders. The outlook is encouraging nevertheless, as large consumers, such as ship and bridge builders, are very busy, and will require a great deal of stuff during the next six months. Prices have not stiffened to any extent yet, although manufacturers are talking that way, and would certainly ask more for deliveries later than May or June.

Prices nominally as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.3¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 3 1/2¢.

**Structural Iron.**—A fair amount of activity is reported in this department, and mills have all their capacity moderately well engaged for some time to come. There is unquestionably a great amount of work to be done in the near future, although there may be delays before it can be got under way. The outlook is on the whole considered favorable, although prices are low and margins narrow. Nominally quotations are about as follows: Bridge Plate, 2¢ @ 2.1¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet-Iron.**—Reports from this branch of the Iron trade are on the whole decidedly favorable. A great deal of business has been taken, while the continued inquiry from dealers and consumers indicates a good demand in the near future. Prices are steady, with some approach to firmness at about the following figures for carload lots:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined No. 28.....	3.60¢
Common, 1/4¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3 1/4¢
Best Soft Steel, Nos. 21 to 24.....	3 1/2¢
Best Soft Steel, Nos. 25 to 26.....	3 3/4¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, 1/4¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67 1/4 %

**Steel Rails.**—The market is dull, although prices are held with some degree of firmness. Sales are chiefly in small lots at about \$28, at mill, and manufacturers claim that the order would have to be something very desirable to secure attention at less money. The demand for Steel in other forms is an important feature, so that, on the whole, mills are doing much better than would be supposed. Reports from other markets are to the effect that \$27, at mill, has been shaded for Rails, but they may refer to transactions made some time ago.

**Old Rails.**—There is very little demand at present, so that prices are nominal at about \$22 bid for spot T's, and \$23 asked. Latest transactions were at medium figures.

**Scrap Iron.**—The market is dull, but prices are nominally as before, viz.: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$23 @ \$24; Old Car-Wheels, \$17 @ \$18, Philadelphia.

## Pittsburgh.

Office of The Iron Age, 77 Fourth Ave. |  
PITTSBURGH, April 29, 1889. |

There has been a considerably increased volume of business in Raw Iron this week. In regard to the near future of the Iron trade there is a diversity of opinion. Some well-informed operators look for business to improve as the season becomes more advanced, while others who look chiefly on the dark side see nothing very encouraging in the near future.

The wage scale will have to be renewed again on the 1st of July, and already the matter is being agitated. Mill owners, it is evident, will demand a reduction, and it will no doubt be resisted, but it is to be hoped that it will be adjudicated without a strike. Pittsburgh mill owners claim

they are paying entirely too much for puddling, &c., as compared with the wages paid east of here for the same kind of work, and that they are in justice and equity entitled to a reduction in the wage scale, but how the Amalgamated Association will view the matter it is difficult at this time to foretell.

The strike at the Rail mill of the Allegheny Bessemer Company still continues; it may be settled within the next 24 hours, and it may hold out for several weeks. Thus far the strike has been conducted on the part of the strikers in as orderly and law-abiding manner as could be expected; there has been but little or no violence, but a very strong pressure has been brought to bear on men who have been secured by the company and sent to the works with a view to starting up. It is thought that enough men will be secured to start up the mill on Monday next. The company have a number of contracts booked, but they are subject to the strike clause, and no great loss will be experienced thereby.

Freight rates on Iron have been reduced on the lines of the Pennsylvania Railroad Company from the Mahoning and Shenango valleys and Wheeling to Pittsburgh, from 80¢ to 65¢ per ton. This may be traceable in part, possibly, to the strong criticisms of Andrew Carnegie upon the policy of the Pennsylvania Railroad toward Pittsburgh, although the demand for the reduction in question, if we mistake not, was made before. This matter of transportation is of vital importance to our Pittsburgh manufacturers, as in these days of very close margins a freight rate frequently determines whether an order is to be placed here or elsewhere. It is not believed that the management of the great corporation in question intentionally discriminates against Pittsburgh, but our manufacturers generally aver that they have not received the treatment they are entitled to, in view of the immense business they give that company. The refusal of the company to give rebates is to be commended.

**Pig-Iron.**—There has been a considerably increased volume of business the past week, but at a reduction in prices. The reduction in freight rates has been to a considerable extent offset, so far as valley furnacemen are concerned, by the decline in price, and the consumer gets nearly all the advantage resulting therefrom. In other words, while the valley furnaceman gets a reduction of 15¢ in transportation, he has been compelled to knock 25¢ per ton off the price of his product in order to sell in this market. Sales of some 6000 tons Gray Forge at \$14, cash; 1500 tons do. at \$14.50, four months, and 1000 tons No. 1 Foundry at \$16.80, cash. The general feeling at present is that \$14, cash, is hard pan for standard brands of mill, but this time will determine. At all events, it is nearer hard pan if it has not not reached there. Bessemer, of which there were no sales reported, is quotable at \$16.25, cash. There appears to be more inquiry for Foundry Irons. Quotations may be fairly given as follows:

Neutral Gray Forge.....	14.00 @ .....	cash
All-Ore Mill.....	15.25 @ 15.75,	"
White and Mottled .....	13.00 @ 13.50,	"
No. 1 Foundry.....	16.50 @ 16.75,	"
No. 2 Foundry.....	15.50 @ 16.00,	"
No. 3 Foundry.....	14.75 @ 15.00,	"
No. 2 Charcoal Foundry.....	21.00 @ 22.00,	"
Cold Blast Charcoal.....	25.00 @ 28.00,	"
Bessemer Iron.....	16.25 @ .....	"

**Muck Bar.**—There has been more activity, but the market continues weak, in sympathy with Pig-Iron. Within the past week or two there has been a decline of 50¢ to 75¢ per ton. We can report sales of 1500 tons at \$26.25, cash; 2000 do. at \$26, cash, and 1000 do., at \$26, cash. It is claimed that there is not much profit in converting Pig-Iron into Muck Bar at \$12 per ton.

**Spiegel**—Is firmer, and is now quoted at \$30 @ \$30.50, cash, for 20 %. Ferro-manganese remains as last quoted—\$58 @ \$58.50 for 80 %.

**Manufactured Iron.**—The Merchant Iron trade continues light for the season, but there are hopes of an early improvement; not only is the demand light, but prices are unsettled and unremunerative. For strictly first-quality Iron prices may be quoted upon a basis of 1.60¢ to 1.70¢ for Bars, 60 days, 2% off for cash, but valley mills are offering Old Rail Iron as low as 1.40¢ @ 1.50¢. There is considerable inquiry for Skelp Iron, and some of the mills have all they can do. Grooved is quoted at 1.62½¢ @ 1.65¢ and 1.90¢ for Sheared.

**Nails.**—The Nail trade here continues very dull, and there does not appear to be much prospect of any immediate improvement. Prices are quoted at \$1.85 @ \$1.90 for 12d to 40d, 60 days, 2% off for cash. Wire Nails, for which there is a demand, are quoted in car lots at \$2.20, 60 days, 2% off. Manufacturers of the latter are making a strong effort to supplant the Cut Nail, and they are meeting with considerable success.

**Wrought-Iron Pipe.**—The Pipe mills are pretty fully employed, some of them having orders enough booked to keep their mills going most of the summer; as stated in our last report, the demand thus far has been chiefly for large-sized Pipe, but there will no doubt be an improved inquiry for the smaller sizes later on in the season. Combination prices are being faithfully adhered to. Discounts on Black Butt-Welded Pipe, 55 %; on Galvanized do., 47½ %; on Black Lap-Welded, 67½ %; on Galvanized do., 55 %; Boiler Tubes, for 2 to 2½ inch, inclusive, 62½ % off; Casing, 5½-inch, 62½ % off; other sizes, 60 % off; 2-inch Tubing, 13¢ ¾ foot, net; 6-inch Line-Pipe, 53¢; 8-inch, 90¢.

**Old Rails.**—Old Iron Rails continue dull, and in the absence of sales may be quoted nominally at \$22.50, cash, at which last sale reported was made. The offerings are not large, but for the time there appears to be little or no inquiry. There is a good demand for Old Steel Rails, and prices are steady; 700 tons short lengths sold at \$17.25 and 200 tons long lengths at \$19.50. Until quite recently Old Iron Rails sold much more readily than Old Steels, but now it is different.

**Steel Rails.**—Heavy sections are still quoted at \$26 @ \$27, cash, at mill, according to size of order and delivery. The Edgar Thomson Works are running right along and pretty well up to their full capacity; but the mill at Duquesne, as noted elsewhere, is standing idle, owing to strike of employees.

**Blooms, Billets, &c.**—Bessemer Steel Billets and Blooms are quoted at \$27 @ \$27.50, cash, at makers' mill; do. Nail Slabs, \$26.50 @ \$27. Owing to the depressed condition of the Nail trade there is not much inquiry for Slabs, which, if we mistake not, are lower than ever before. Domestic Bloom and Crop Ends quoted, in absence of sales, at \$17.50 @ \$18. The last sale of the former reported was at \$18.

**Railway Track Supplies.**—No change in prices. Spikes, 2¢, 30 days, f.o.b. cars at works. Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts.

**Old Material.**—The demand for all kinds of Old Material continues light, and there has scarcely been enough doing of late to establish prices, which we quote nominally as follows: No. 1 Wrought Scrap, \$19, net ton; No. 1 Wrought Turnings, \$18; Old Car Axles, \$24 @

\$25; Cast Scrap, \$14 @ \$15, gross ton; Cast Borings, \$11 @ \$12; Old Car-Wheels, nominal, \$19

## Louisville.

LOUISVILLE, Ky., April 27, 1889.

The market continues dull, and there has been little change during the past week. Several large transactions are on the point of being closed, provided furnaces will sell for deliveries desired. There is no change for the better, and prices remain low, with little prospect of a speedy advance. All grades appear quiet, and consumers are able to make purchases to meet their views with little trouble. The policy of consumers appears to be as fast as they make contracts to cover with purchases of Iron, so that when the real advance takes place they will be benefited by it. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification.....	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification.....	13.75 @ 14.25
Gray Forge.....	13.25 @ 13.75
White and Mottled, different grades.....	12.75 @ 13.25
Silver Gray, different grades.....	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry.....	16.25 @ 16.75
No. 1 Mill.....	14.75 @ 15.25
Southern Car-Wheel, standard brands.....	21.75 @ 22.75
Southern Car-Wheel, other brands.....	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry.....	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry.....	19.50 @ 21.00
Hanging Rock, Cold Blast.....	20.75 @ 22.75

## Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, April 29, 1889.

**Pig Iron.**—The condition of the market and the movements of Iron are practically unchanged since the last report; there seems to be a market for all the Iron that is being turned out, as there is but little being stacked at such furnaces as are disposed to take the market rates for their output, which is the case with most of them. The demand seems to come from all quarters of the United States, from single carloads up to 100 and 500 ton lots, and most orders are for quick shipments. There are some sales being made for large round lots, but it appears to be generally understood that these are for speculative purposes, as some of these purchases are being filled up at the furnace yards. We note sales of 1000 tons No. 2, a favorite brand at \$12, cash, at furnace yard, to be so disposed of, and learn that quite a number of other lots are being so placed. Upon the whole there appears to be but little animation manifested in any of the Pig-Iron producing centers, but rather a waiting for something to turn up. In the meantime it appears to be generally conceded that prices will not at present advance, and it is quite certain that they cannot well go lower.

## Cleveland.

CLEVELAND, April 27, 1889.

**Iron Ore.**—Nearly all the mining companies have made fair sales during the past week, the aggregate amount of ore sold since the last report probably aggregating 300,000 tons. Buyers are asking for Gogebic Bessemer this week and several large blocks will be sold within the next few days at an average price of about \$5.25 ¾ ton. Considerable Ore from the Chapin Mine has been sold to furnacemen along the Lehigh Valley Road at prices varying from \$5.10 to \$5.25, f.o.b. vessels Buffalo. Ores from the Champion and Republic mines are still bringing \$5.75 readily and Minnesota Ores are in good demand at the same figures. Nearly 80,000 tons of new Ore have been unloaded at Cleveland, Ashtabula and Fairport

during the past week. The Ore men are having no difficulty in engaging tonnage at 90¢ from Escanaba, \$1.10 from Marquette and \$1.25 from Ashland and Two Harbors.

**Pig-Iron.**—There is a little more inquiry than was noticeable a week ago, but the prices realized for the small lots reported sold are too vacillating and indefinite to base reliable quotations upon. An improvement is expected whenever these scattering sales, grouped together, cause a scarcity. Furnace agents do not seem to be attempting to force business, contenting themselves with waiting a week or two longer for the hoped-for change in the situation. Foundry Irons are more affected by the present depression than are the better brands of Gray Forge, for which a light though continued inquiry is reported.

**Manufactured Iron.**—The demand is not heavy, and Bars are quoted at 1.60¢ @ 1.70¢, 60 days, 2% off for cash, for carload lots from mill. Sheets are firmer.

**Odd Rails.**—The market is far from active. A surplus of Old Wheels is reported, and Old American Rails do not command over \$21.50.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, April 29, 1889.

**Pig-Iron.**—Business in Pig-Iron here during the week under review has been dull, yet there has been a number of small orders for carload and 50-ton lots, which in the aggregate make a not unfavorable showing. A few 1000-ton lots are also reported by a few agents and dealers, among them being 1000 tons Gray Forge Iron on a basis of \$18, cash, here. The regular price for No. 1 Southern Foundry Iron is \$14.75 @ \$15, with the outside rates an extreme, and only small sales at these rates. No. 2 Southern Foundry has been offered at \$14.25 @ \$14.50, the outside rate for small amounts. A special sale for June, July and August delivery has been made during the week consisting of 2000 tons No. 1 Foundry, at \$15.40, and 2000 tons No. 2 do., at \$14.40, on time. Mottled Iron has continued heavy and depressed, and Car-Wheel grades have remained neglected. The following are the approximate prices current here at the close, for cash, f.o.b.:

Foundry.	
Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification).....	14.00 @ 14.50
Southern Coke, No. 3 (new classification).....	13.50 @ 14.00
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 20.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.	
Strong Neutral Coke.....	13.25 @ 13.50
Mottled Neutral Coke.....	12.00 @ 12.50
Gray Forge.....	13.00 @

Car-Wheel and Malleable Irons.	
Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

**Manufactured Iron.**—There is no improvement in the demand for Manufactured Bar or Structural Iron and an easy tone has continued to prevail, but prices are without quotable change.

**Nails.**—The market has been a little irregular in tone and the demand has been only moderate. 12d @ 40d sell at \$1.90 @ \$1.95 ¾ keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.45 @ \$2.50 ¾ keg.

**Old Material.**—The demand has been light and a weaker tone has prevailed, but there has been no pressure to sell. Old

Rails have remained dull, but it is difficult to obtain desirable lots under \$20, cash. Buyers of Old Wheels have reduced their limits to \$17.50, but there are few sellers under \$18, spot cash.

## New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York. April 29, 1889.

**American Pig.**—The only feature of any interest during the week under review has been the report that Southern Iron has been offered both at Boston and in this market at \$16 for No. 1. The quotation in the New England market is particularly low, since the cost of delivery to that point is nearly \$1 higher than it is to New York from the Southern furnaces. It should be stated, however, in connection with these low offerings that they emanate exclusively from new companies, who are introducing their Iron and naturally find it necessary to make concessions. While the quantity that is offering is naturally small, and the pressure to sell can only be temporary, it is nevertheless having its effect upon the market, which is weaker. We continue to quote Northern standard brands \$17.50 @ \$18 for No. 1, \$16.25 @ \$17 for No. 2, and \$15 @ \$15.25 for Gray Forge. The latter is difficult to sell, and if wanted could be bought at \$14.50, at tidewater.

**Spiegeleisen and Ferromanganese.**—No transactions of any consequence are reported, but the offerings of a number of large blocks have caused a weakening to \$27.25 as sellers' figure, which buyers do not approach. We quote, Ferromanganese \$56 @ \$56.50, ex-ship.

**Structural Iron and Steel.**—We continue to quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.4¢; Flange, 2.55¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

**Bar Iron.**—For large lots, Common is being offered at 1.55¢, delivered. The market remains dull. We quote: Carload lots on dock, Common, 1.6¢ @ 1.65¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Steel Rails.**—Pittsburgh has again become a storm center, a recent large sale in that market having been made at \$26, if reports generally current are to be credited. An additional feature causing weakness is the offering by brokers of two 10,000-ton lots, bought on speculation from a new mill. The only sales reported during the week have been 2500 tons by an Eastern mill at private terms, and about 2000 tons, Anniston delivery, by a Pittsburgh mill. There are a few large Southern orders still in the market, but in the case of at least one of them the financial standing of the purchasers and the conditions offered are not such as to induce much rivalry for the business. The vigorous competition between the Pittsburgh mills has created a good deal of uneasiness, and it is reported that the rail-makers will soon hold another meeting to discuss the situation. In the meantime, the market is unsettled, with \$27 @ \$27.50 the usual quotation. The lower figure, however, might, under exceptional circumstances, be shaded.

**Old Rails.**—The market is dull, the quotations remaining nominally \$22.50 @ \$23.

**Rail Fastenings.**—Some of the recent contracts taken for Rail Fastenings have been at exceptionally low figures; thus \$1.70 has been made for Angles, delivery at Toledo, the seller being a Western mill,

while an Eastern mill has named \$1.60, delivery at Boston. Spikes continue demoralized at \$1.90 @ \$2.

Messrs. Witherbee, Sherman & Co. have moved their offices to the Bank of America Building, Wall street.

The American Pig Iron Storage Warrant Company occupy new offices on the fourth floor of the Bank of America Building, Wall street.

The Joliet Steel Company, A. T. Shoemaker, agent, has removed to the Bank of America Building, Wall street.

## Financial.

Yielding to the pressure of an all-pervading national sentiment, the volume of business for the current week is necessarily curtailed, and the record of transactions, for the same reason, is partial and fragmentary. The report that the Senate and Assembly had concurred in a resolution to make Monday and Wednesday of this week legal holidays was received with much satisfaction by most of the members of the several exchanges, and generally in other commercial circles. The feeling seemed to prevail that the Governor would sign the bill, thus creating an unbroken succession of legal holidays from Saturday at noon to Thursday at 10 o'clock in the forenoon. Some inconvenience is likely to arise, but no serious trouble. The Canal Commissioners give notice that the Erie Canal will open in its entire course May 4, and from Buffalo to Utica May 1. All along the line of the lakes and canals the season will open remarkably early. Some uneasiness exists in commercial circles, arising from an effort to induce Secretary Windom to abandon the proposed site for the appraiser's stores in this city. The monthly report of the Bureau of Statistics was favorable far beyond expectations, showing the exports of merchandise for March to have been \$69,114,358, which is nearly \$19,000,000 more than they were for March, 1888, and considerably more than they have been during any March since the present tariff act has been in operation. The imports for March also show a gain, being \$66,281,032, or \$3,000,000 more than they were in March, 1888, and also more than they have heretofore been in March of any year since 1888. While few ventured to predict that the exports for the month would equal the imports, an excess of more than \$7,500,000 in the balance of trade was wholly unlooked for, and this against an adverse balance of \$11,000,000 a year ago. For nine months the favorable balance is \$62,452,863, and this gratifying feature in the financial situation is well calculated to add zest to the centennial ovation.

The Stock Exchange markets were without notable feature until Thursday, when the brisk demand, both for stocks and bonds, influenced very considerably by higher prices in London, together with a plethora of money and improved foreign trade reports, occasioned a sharp advance. The chief interest centered in the bond market. There were occasional slight reactions due to realizations and bearish pressure, but the recoveries were prompt, and the market was strong at the close. There was more or less realizing on Friday, but the tone was strong on Saturday, and comparisons show a general gain in prices for the week.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	108½
U. S. 4½, 1891, coupon.....	108½
U. S. 4, 1897, registered.....	123½
U. S. 4, 1897, coupon.....	123½
U. S. currency.....	121

The bank return for the week shows an increase of \$1,340,300 in surplus reserve, which now stands at \$13,426,950. The

loans are contracted \$982,900; the specie is decreased \$849,800; the legal tenders are up \$2,201,800; the deposits other than United States are increased \$46,800.

The exports of specie were for the week \$1,794,000, and the imports \$167,000. The imports of merchandise were valued at \$9,574,000, of which \$2,000,000 represents dry goods.

The money market was easy, time money being available at low rates in amounts in excess of the demand. For three to four months the quotations were 2½ @ 3%, and for longer periods 3 @ 3½%. Commercial paper was in good demand, with small offerings.

The market for sterling was dull and a shade easier. There was an increased supply of security bills. Posted rates closed at \$4.88 @ \$4.90.

The general markets were unusually quiet, aside from fluctuations of a speculative character. Sugar again advanced, granulated now selling at 8½¢ @ 9¢ lb, as compared with 7¢ in March, when the advance commenced. Sugars for which the refiners now charge 8½¢ cost them in the raw state 7½¢. Formerly 8¢ was the average margin between the market price of raw and refined sugar. Cotton is stronger, but wheat, flour, provisions and some other commodities betray weakness. Among dry-goods jobbers there is an expectation of more business after the holidays. New York prices of wheat on Saturday were 83½¢ for May, 84½¢ for June, 86¢ for July and 89½¢ for December, as against a week ago of 84½¢ for May, 85¢ for June, 86½¢ for July and 89½¢ for December.

## Metal Market.

**Copper.**—Since our last weekly report spot Copper advanced in the London market from £36. 17/ to £38. 5/, and futures from £37 to £38. 5/, at which it wound up strong yesterday, sales aggregating 1375 tons. Intimations were privately cabled from the other side, it appears, that negotiations between the representatives of mines and the parties interested over there are proceeding more smoothly, so that ere long an understanding may be reached. This may perhaps explain the greater buoyancy in London, or the latter may simply be due to the covering of bears. Paris, meanwhile, cabled April 27: "The report of the receivers of the Comptoir d'Escompte says that by prudent realizations the assets of the concern will probably yield a surplus of 6,000,000 francs. The report also indicates the manner in which shareholders may enforce their claims on the personal estate of the late M. Denferi-Rochereau. The new Comptoir d'Escompte will begin operations on May 1." Nothing in the way of actual business meanwhile transpired in our market. For Lake 14½¢ is offered and 15½¢ asked. We understand that some of the leading interests are advocating the fixing of the price between 12¢ and 13¢, with the probability that the former will be adopted.

**Tin.**—Tin has been on the downward track again in London, giving way since we last reported from £92. 10/, spot, to £91. 5/ and futures from £98. 2/6 to £92. 2/6 yesterday, sales summing up 460 tons in the meantime. Here greater activity developed, 10 tons spot being sold at 20.65¢; 20 tons May at 20.50¢; 10 tons June at 20.60¢; 10 tons July at 20.60¢; 10 tons August at 20.65¢, and 10 tons September and 10 tons October, also at the latter figure; subsequently the downward course of the London market unsettled ours, spot being easy at 20½¢; July at 20.40¢, and 10 tons October being parted with at 20.55¢. The market closes in New York at 20½¢, spot, at the Metal Exchange; 25 tons prompt shipment brought 20.40¢. **Tin-Plates.**—There is no change here, and the

market is very dull. There are indications of weakness in the foreign markets in everything in the Tin-Plate line except Ternes. We quote, large lines, ordinary brands, 3 box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.75; Ternes, \$4.12 @ \$4.30; Coke Tins, \$4.30 @ \$4.40, and Wasters \$4.15 @ \$4.20.

**Lead.**—Our market is very demoralized, with sales of 100 tons Common Domestic to consumers at 8½¢, and rumors of sales at 8.60¢. The Western markets are extremely flat at 8.40¢.

**Spelter.**—The volume of dealings in Common Domestic has been reduced by an absence of active demand, and the little done has been at 4.65¢, while Silesian has advanced to 5¼¢, below which none can be had.

**Antimony.**—A moderate jobbing trade has been proceeding at 12¢ Hallett and 13¼¢ Cookson.

### New York Metal Exchange.

The following sales are reported:

THURSDAY, April 25.	
10 tons Tin, spot.....	20.65¢
10 tons Tin, June.....	20.60¢
10 tons Tin, July.....	20.60¢
10 tons Tin, August.....	20.65¢
10 tons Tin, September.....	20.65¢
10 tons Tin, October.....	20.65¢
10 tons Tin, May.....	20.50¢
FRIDAY, April 26.	
28,000 lb G. M. Copper, spot.....	12.00¢
48 tons Lead, May, first half.....	3.62½¢
10 tons Tin October.....	20.55¢
SATURDAY, April 27.	
25 tons Tin, prompt shipment.....	20.40¢

### Coal Market.

The Coal trade is without new feature, dullness being the general complaint. Quotations for Anthracite Free-Burning, f.o.b., are: Broken, \$3.75; Egg, \$3.90; Stove, \$4.15; Chestnut, \$4. Reading Hard White Ash prices are the same excepting Broken, which is \$3.90, and Egg, \$4. Pea is \$2.30 @ \$2.40; Lump and Steamboat, \$4.25. Individuals cut these figures materially. The Reading Railroad has reduced the prices for furnace sizes of Anthracite 25¢ per ton, making the new price \$1.85 per ton at the mines. The tolls to furnaces along the Schuylkill Valley have also been reduced an average of 8¢ per ton, according to the distance of the furnaces from the mines. These reductions in prices and tolls took effect at once. A new coal yard, with a storage capacity of 1,000,000 tons, is to be built at Mahanoy City by the Reading Railroad Company. The contract for supplying the Hoboken Ferry Company with 2000 tons has gone to the Pocahontas region at prices said to be somewhat below those of the Seaboard Association, whose figure is \$3.50.

Although the official figures are suppressed, the stock of coal at tidewater April 1 is commonly understood to have been about 897,000 tons, an increase of 60,000 during March.

Daniel S. Lamont, ex-President Cleveland's former private secretary, and ex-Senator Thomas C. Platt have been elected directors in the Tennessee Coal and Railroad Company.

The Detroit Gas Company, of Detroit, Mich., on Saturday, at Pittsburgh, contracted for 16,000 tons coal. The Youghiogheny and Ashtabula Coal and Coke Company received the contract for 8000 tons, and Osborn, Sager & Co. received a contract for a like quantity. The rate is \$2.16 per ton, f.o.b., in Detroit.

The Lackawanna Coal and Iron Company, Scranton, Pa., are adding a new converter to their plant.

## British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, MONDAY, April 29, 1889.

Merchant Bar Copper declined to as low as £38. 10/ last week, owing to various unfavorable rumors, but subsequently reacted to £38. 12/6, under the influence of reports of partial success of efforts made to form a new combination, together with a sharp rise in prices of mining shares. Today the price is about £37. 5/ @ £37. 10/, but speculation is without spirit and consumers are still purchasing cautiously. Large holders have continued to realize when favorable opportunities offered for doing the same without depressing prices.

The Tharsis Company have declared a dividend of 25 %, the "syndicate" having settled for all Copper delivered, leaving as the loss to the company the margin between contract price and open market rates. It is stated the losses of the Société des Métaux amount to 121,000,000 francs, omitting those that will probably result from non-execution of contracts and consequent settlements of difference between contract and market prices.

Block Tin has weakened again, prompts selling at as low as £91 and futures at £92, although the pressure of supplies has been moderate. The Batavia sale of Billiton last week realized an average of £93 in Holland.

Speculation in Pig-Iron Warrants has been more animated, particularly for the account of outsiders, but prices have eased off to 44/ under per cent. selling by holders. Makers' brands of Scotch show but slight variation in price and continue to sell briskly. Middlesborough Pig has been in active demand for forward delivery, and a further increase in the output is being arranged for, with precautions taken not to extend the production so as to unfavorably affect prices. Hematites are noticeably strong and have been sold this week at 6d. advance.

There has been an active demand for special sorts of Tin-Plate, and the general demand has averaged good also, giving prices decided firmness. There are rumors of two South Wales works being in difficulty. The proposed "syndicate" propositions are being discussed, but further than this, have not progressed.

In nearly all branches of the Manufactured Iron and the Steel trades, there continues to be an active business, and prices are very firm throughout.

**Scotch Pig.**—A fairly active business, with but little change from last week's prices.

No. 1 Coltness, f.o.b. Glasgow.....	55/
No. 1 Summerlee, " ".....	54/6
No. 1 Gartsherrie, " ".....	52/6
No. 1 Langloan, " ".....	55/
No. 1 Carnbroe, " ".....	47/6
No. 1 Shotts, " at Leith.....	53/6
No. 1 Glegarnock, " Ardrossan.....	52/
No. 1 Dalmeilington, " ".....	46/
No. 1 Eglinton, " ".....	45/
Steamer freights, Glasgow to New York, 2/6; Liverpool to New York, 10/.	

**Cleveland Pig.**—The market not so strong, but demand good, particularly for futures. No. 3 Middlesborough, G.M.B., 38/6 prompt, and 39/ future.

**Bessemer Pig.**—A large business passing and the market strong. West Coast brands, mixed numbers, 50/, f.o.b. shipping point.

**Spiegeleisen.**—Prices firmly held, and the demand fair. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

**Steel Rails.**—Demand continues brisk and prices are strong. Heavy sections quoted at £4. 12/6, and light sections £4. 17/6 @ £5, f.o.b. at N. W. England shipping point.

**Steel Blooms.**—Sellers very firm, but the demand only fair. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

**Steel Billets.**—The market strong and demand fairly active. Bessemer, 2½ x 2½ inch, £4.10/, f.o.b. at N. W. England shipping point.

**Steel Slabs.**—Moderate sales making, but prices very firm. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

**Old Rails.**—No change in this line; the demand slow. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 12/6 @ £3. 15/, c.i.f., New York.

**Scrap Iron.**—Market very quiet; no change in sellers' prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

**Crop Ends.**—Demands still moderate, but prices firm. Bessemer quoted £2. 10/ @ £2. 12/6, f.o.b.

**Tin Plate.**—Demand has been fairly active, and prices are firmly held. We quote, f.o.b. Liverpool:

1C Charcoal, Allaway grade.....	15/3 @ 15/9
1C Bessemer Steel, Coke finish.....	13/6 @ 14/
1C Siemens " ".....	14/ @ 14/6
1C Coke, B. V. grade.....	13/ @ 13/3
Charcoal Terne, Dean grade.....	12/ @ 12/6

**Manufactured Iron.**—There continues to be a good trade, and prices are very firm. We quote, f.o.b. Liverpool:

	£ s. d.	£ s. d.
Staff. Ord. Marked Bars.....	@ 8 2 6	@ 8 2 6
Common " ".....	@ 5 17 0	@ 5 17 0
Staff. Bl'k Sheet, singles.....	@ 7 15 0	@ 7 15 0
Welsh Bars (f.o.b. Wales).....	5 2 6 @ 5 5 0	5 2 6 @ 5 5 0

**Copper.**—Less business doing for consumption. Speculation fairly active. Today's prices for Bars were £37. 5/ @ £37. 10/, spot; £37. 10/, three months' futures. Best Selected, £45.

**Tin.**—The demand slow, and prices rather weak. Straits sold at £91, spot, and £92 for three months' futures.

**Lead.**—A fair business doing, and prices steady. Quoted £12. 15/ for Soft Spanish.

**Spelter.**—No material change in prices. The demand fair. Quoted at £17. 12/6 @ £17. 15/ for ordinary Silesian.

## Foreign Markets.

### BRAZIL.

PARA, April 23, 1889.—**India Rubber.**—The steamer Finance has just left for New York with 70 tons of Rubber on board, leaving no stock in first hands and only 70 tons in second hands. A cablegram from London, dated today, announces the sale there of 180 tons fine Para at 31½¢ per lb, and that still higher prices are asked for the unsold remainder.—Per cable direct.

### CHILI.

VALPARAISO, March 1, 1889.—**Copper.**—Not a ton of Copper has been sold during the fortnight, and it is nominal, owing to the unsettled condition of the London market. Coal is held with increased firmness; Newcastle at 30/, and Australian at 30½/. Exchange.—90 days' sight on London, 29½¢.—Weber & Co.

## EAST INDIES.

**MANILA**, April 22, 1889.—*Hemp*.—There are buyers at \$12.50, against \$8.25 same date last year, equaling  $\frac{1}{2}$  ton, cost and freight, £42. 17/6, against £28. 15/6. No clearances are reported for the United States since last cable, against 14,000 bales in 1888. Since January 1, 105,000 bales, against 57,000; loading for ditto, 11,000, against 16,000; cleared for England since January 1, 87,000 bales, against 107,000; loading for ditto, 8,000, against 14,000; cleared for all other ports, 12,000, against 25,000; receipts at all ports since last cable, 11,000, against 8,000, and since January 1, 211,000 bales, against 184,000 in 1888 and 139,000 in 1887. *Freight*, \$7.50, against \$5. *Exchange*, six months' sight, 3/7, against 3/8 $\frac{1}{2}$ .—*Ker & Co.*, per cable to their agent in New York. *Mr. Charles Nordhaus*, 89 Water street.

**COLOMBO**, Ceylon, March 14, 1889.—*Plumbago*.—Dealings for export have been restricted for the week to small parcels at ensuing quotations in rupees  $\frac{1}{2}$  ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Amounts exported to date since October 1 have been as follows: To England, 54,901 cwt.; to Hamburg, 5418; to Antwerp, 5101; to Bremen, 659; to Holland, 437; to India, 63; to Australia, 88; and to the United States, 63,727; together 130,394 cwt., against 114,527 in 1888, 102,712 in 1887, and 81,641 in 1886. *Exchange*, six months' sight, 1/4 27-32.—*Volkart Bros.* to their agent, *Mr. John W. Greene*, 82 Wall street.

## SOUTH AFRICA.

**PRETORIA**, Transvaal, March 21, 1889.—*Silver*.—Rich Silver ores have been discovered in our immediate vicinity on the Middleburg-Barberton road, and several mining companies have been started here and in Johannesburg. Shares are to be placed in the European markets.—*Argus*.

## RUSSIA.

**ODESSA**, April 15, 1889.—*Petroleum*.—The formation of a company is planned at Baku for the purpose of pushing the export of Naphtha and Petroleum to Chinese, Japanese and Siberian ports. *Entrepôts* of refined Petroleum are to be created well furnished with lamps suitable for its use at Vladivostok and Petropavlosk, whence it is to be shipped to branch establishments in China, Japan and East Siberia. Shipments of Russian Petroleum in tank steamers to England reached the equivalent of 143,474 barrels since January 1, as compared with 36,259 last year. During the same period last year the United States have shipped to England 181,449 barrels, and this year 168,867 barrels.—*Commercial Gazette*.

## SPAIN

**BILBAO**, April 6, 1889.—*Iron Ore*.—The bad weather has checked activity in Ore dealings on the spot, the comparatively little done being at 7/ @ 7/4 Rubios and 8/4 @ 8/8 Campanil, the latter still tending upward, owing to its growing scarcity. There are steamers in port of a joint capacity of 80,000 tons chartered to load Ore. Freight is drooping still further. The total export of Ore hence to date aggregates 1,061,654 tons, against 1,024,858 tons same time last year. *Pig-Iron*.—There were shipped during the week 3193 tons abroad and 1117 coastwise. The spot quotation of the Vizcaya Company's Pig-Iron is 60 @ 65 francs  $\frac{1}{2}$  ton, f.o.b., to arrive (deliverable at any time in 1889), 58 @ 62.50, analysis guaranteed. During the first quarter the Altos Hornos Company exported 3027 tons of Pig-Iron; the Mudea, 4618, and the Vizcaya, 13,565; together, 21,210 tons, against 17,268 in 1888.—*Bilbao Marítimo y Comercial*.

## GERMANY.

**HAMBURG**, April 20, 1889.—*Iron*.—The Rhenish Westphalian Pig-Iron market has continued active, but the latter less so for export. Americans were ready to take large lines for forward delivery, but makers were not disposed to sell so long ahead at ruling rates. Now this demand revives on a large scale, but if Americans want any they will have to submit to an advance should the English market continue firm. The present price on the spot remains 63. An advance of 2 marks  $\frac{1}{2}$  ton is asked for deliveries of Forge Pig during the last quarter of the year; the present figure is 55 to 57. English Bessemer on the West Coast commands 49, an improvement of 1/. Finished Iron for home use is doing well, but not for export. The most active articles are Beams, for which the demand increases daily, and Boiler Plates. The advance of \$1 in Wire Rods in America causes a better feeling therein. There is no change in other products in the Iron and Steel branches.—*Borsenhalle*.

The sales of bunting in New York for decorative purposes during the past week have been enormous. According to one estimate the expenditure on this account will amount to \$1,500,000.

## Wages in 1800.

The following extract from "McMaster's History," showing the condition of the working classes nearly a century ago and the rate of wages then prevailing, will be found of more than usual interest to mechanics of the present day:

The condition of the wage class of that day, 1800 (A. D.), may be well examined. It is full of instruction for social agitators. In the great cities unskilled workmen were hired by the day, bought their own food, and found their own lodgings. But in the country, on the farms, or wherever a hand was employed on some public work, they were fed and lodged by the employer and given a few dollars a month. On the Pennsylvania canals the diggers ate the coarsest diet, were housed in the rudest sheds, and paid \$6 a month from May to November and \$5 a month from November to May. Hod-carriers and mortar-mixers, diggers and choppers who, from 1793 to 1800, labored on the public buildings and cut the streets and avenues of Washington City, received \$70 a year, or, if they wished, \$60 for all the work they could perform from March 1 to December 20.

The hours of work were invariably from sunrise to sunset. Wages at Albany and New York were 3 shillings, or, as money then went, 40 cents a day; at Lancaster, \$8 to \$10 a month; elsewhere in Pennsylvania workmen were content with \$6 in summer and \$5 in winter. At Baltimore men were glad to be hired at 18 pence a day. None by the month asked more than \$6. At Fredericksburg the price for labor was from \$5 to \$7. In Virginia white men employed by the year were given £16 currency; slaves when hired were clothed and their masters paid £1 a month. A pound, Virginia money, was, in Federal money, \$3.33. The average rate of wages the land over was \$65 a year, with food and perhaps lodging. Out of this small sum the workman must, with his wife's help, maintain his family.

## Hardware in England.

From discussions which are carried on in the English trade journals it is evident that Hardwaremen are to a greater or less extent embarrassed by the competition of co-operative stores and merchants in other lines who offer to their customers a variety of goods which have been regarded as legitimately belonging to Hardwaremen. The London *Ironmonger*, in a recent issue, contains answers to inquiries as to the extent to which ironmongers are affected by the competition of the London or local co-operative stores or by competition of drapers, tea shops, &c., and as to the best and surest way of successfully meeting the competition and cutting of the stores, drapers, tea shops, &c. From these replies we make the following extracts, which, aside from their bearing on the question under discussion, will be of interest as reflecting more or less fully the conditions under which English Hardwaremen are carrying on their business:

In the first place, buy and sell as much as possible for cash; encourage ready-money sales by allowing 5 per cent. on all transactions above, say, 10 shillings; sell all leading articles very cheap, and ticket them up in your shop and windows; keep windows clean and tidy and make them attractive—50 per cent. of the ironmongers' shop windows are a disgrace to the trade; fill a whole window occasionally with special or seasonable goods—at present there should be a good display of Garden Tools and Implements. In the second place, see that you give no employment whatever to any one connected with a co-operative store, as they only make use of you to suit their own ends, but employ those only who believe in individual enterprise—they, being your own customers, are entitled to the first claim upon you; speak and write very plainly to manufacturers; let them understand that you will not

ers on this subject, and ask them to do all in their power to discourage this movement, which has now become so great a hindrance to buy goods which you know to be made almost wholly by co-operators. Many manufacturing districts which could be easily named are now almost wholly given up to co-operation, and some towns are now completely ruined for business. If this leveling-down system is allowed to go on at the same rate that it has been doing for some time past very soon there will be little use for either manufacturer or merchant. Individual effort against this and other injustices to the trade is very good so far as it goes, but without united action little can be done. Almost every trade has got its association for self-protection. Why not the ironmongers?

If capital is available, make a big show and go in for novelties; but this must not be done unless with a firm determination to carry it through, and get a name for cheapness whether you are cheap or not. How this is done I have not yet found out.

Do your business on the same lines as stores, &c. I always endeavor to impress on customers who I know deal at stores that any article can be supplied at the same rates and price for cash, and never let it be thought for one moment that you can be beaten in fair competition.

If it were only a question of prices it might be met; but the prejudices of the people are to be overcome. One way is persistent advertising and comparing store prices with that of your own. Another is to have nothing to do with those houses that supply the stores, as in three cases out of four it is not done fairly. I also think there should be more interchange of opinions in conversation among ironmongers themselves on the matter.

The mischief has become chronic and will be difficult to alter now. The trade guilds of centuries ago would come in useful now if revived. Other agencies are also working fatal mischief to the ironmonger. Thus, wholesale houses are open to receive orders from architects, agents of estates and private individuals, and quoting discount at almost the same rate as to the ironmonger, so that the latter has to compete directly with the producer, and must give up the greater part of his discount or lose the order.

## Labor in the New York Prisons.

Machinery will again be employed in the State's prisons of this State if the Fassett bill becomes a law, of which there now seems to be a strong probability. Only by a very close vote in the Assembly was the State saved from the burden of taxation and demoralization of convict labor entailed by the Yates bill, which it was proposed to re-enact with some ameliorating features, but which really afforded no adequate relief. The Fassett bill provides for three grades of prisoners. The last grade is to be composed of incompetents and incorrigibles. An amendment was carried, 69 to 41, preventing the employment of third-grade men on machines of any kind, the object being to make scavengers and general utility men of those who will not work. The question of abolishing machinery altogether was decided in the negative by a vote of 66 to 43, thus permitting the restoration of machinery, with which the prisons have been equipped at a considerable cost. To some extent, however, the bill is emasculated and rendered nugatory by the adoption of an amendment offered by the opponents of the Fassett bill as a sort of compromise, as follows: "The total number of prisoners employed at any one time in manufacturing one kind of goods which are manufactured elsewhere in the State shall not exceed 100 in number in all of the State's prisons, penitentiaries and penal institutions in the State, and shall not exceed 10 per centum of the number of all persons within the State employed in manufacturing the same kind of goods, as shown by the last United States census or state enumeration, except in industries in which there are employed not to exceed fifty free laborers." As finally passed in the Assembly last Monday, the bill appropriation was cut down to \$500,000. In this shape there were but 20 negative votes.

# Hardware.

We continue below the careful review of business throughout the country, as per detailed advices received from representative wholesale and retail merchants in the different States:

## District of Columbia.

Our advices are to the effect that business in general is good, and the outlook is certainly as good as last year's, and probably better. Competition has kept prices down to a very low margin of profit, and in this respect matters are not improving. The distrust on the part of the trade as to stability of prices has not, however, prevented them from purchasing a sufficient quantity of goods to keep their stocks well assorted, and they appear to be a little larger than usual. Building promises to be active. Collections are a little slow, but there is probably little ground for complaint.

## Delaware.

Trade during the season has been uneventful and not altogether satisfactory as to volume, and at present Hardware is dull. The low prices of produce have a depressing effect. Collections are sluggish.

## Virginia.

General business shows an improvement over last year, and in many points is reported as quite active, though in some complaint is made of dullness. The Hardware trade was rather late in opening this spring, but business in the main has been satisfactory, and the trade are still fairly busy filling orders. Full stocks are in many cases carried, but the margins at which goods are sold are referred to as close. A cheerful tone characterizes the reports from this State, and the prospects are generally referred to as bright, there being a good deal of building in anticipation, a number of towns showing evidences of enterprise and progress. The short crops for the past few years and low prices for agricultural products the past year have operated against business, but the outlook now for the present season seems favorable and farmers report their growing crops as promising. Collections are good, and merchants are rather more conservative than usual in crediting goods to their country customers, and a larger proportion than usual of cash sales are made. There is not likely to be much improvement in this regard or in the volume of business until the crops are marketed. The development of manufacturing and the erection of factories in a number of places indicate well for future business.

## West Virginia.

During the past few weeks business in general has been very fair, but before that was rather slow, owing largely to the condition of the roads, and trade was usually disappointing. Hardware has sympathized with these general conditions and dragged during January and February, but has been quite active since March 1, and careful estimates point to the conclusion that sales for the first quarter of this year will just about equal those for the same time in 1888. It is to be noted that stocks are generally light, as buyers have not been anticipating their wants as freely as usual, and there has been a great deal of pick-up buying. The impression that prices are low and uncertain has tended to induce this, there being little confidence that the bottom has yet been reached. The reports in regard to the amount of building under way or contemplated vary according to the locality, but their general tenor is that there will be more activity in this direction than for some time, and cheap houses especially are likely to preponderate. The

agricultural conditions are good, crops for the last year or two having been fair and those for the present year looking well. Collections throughout the country regions are slow and hard, but in towns usually easy and prompt. There is increased railroad-building and development of the interior of the State, which is affecting business favorably.

## North Carolina.

Reports in regard to general business indicate that it is fair and that in Hardware a satisfactory condition of things exists, the demand having been good for the past few months. Trade will probably be light until the early fall, when it is expected that a large business will be done. Stocks of Hardware are full too large, but have been diminished somewhat since January 1. Reports from a number of places indicate considerable building at present and in prospect. Collections are very fair. Prices are referred to as low and demoralized.

## South Carolina.

The volume of general business has been good and, in general, up to reasonable expectations. There was, however, something of a general falling off in March, but April witnessed an increased activity. Merchants are usually well stocked with goods, and our advices indicate that they average somewhat more than usual. Our correspondents allude to the unsteadiness and weakness in prices and the narrow profits at which goods are sold. A demand for a better class of goods is, however, referred to. During the season there will be a good deal of activity in building, of which there will be more than for several years past, so that if the crops turn out well, which is at present expected, though, of course, there is the usual uncertainty on this point, it is expected that there will be a fine trade in the fall. Collections of accounts made last year are referred to as having been satisfactory, and there are indications that the ability and will to pay are improving generally. It would appear that manufacturers have had better business through the State than jobbers. Some few salesmen complain of the meagerness of orders. The increased number of new enterprises improves trade and arrests in some degree the outgo of money for manufactured goods.

## Alabama.

Advices from this State are cheerful and indicate a good condition of things. Business generally has been satisfactory, with but little reason for complaint, and where this is the case it is owing to special causes which do not represent conditions generally. Stocks of Hardware are well kept up and ample for requirements. The continued development of the State and its industries stimulates business. A good deal of building is indicated and, with good prospects for crops, a hopeful feeling prevails in regard to the fall trade. In agricultural sections farmers have had fine weather for their work, and they have been making good use of it. But little fault is found with collections, and money is referred to as easier now than for some time past. The development of Northern Alabama is progressing satisfactorily, and reports from this part of the State are especially hopeful. The following careful reviews of the situation from Birmingham and Mobile will be of interest:

**BIRMINGHAM.**—Making the comparison from January 1, 1888, to April 1, 1888, with the period of January 1 to April 1, 1889, our business is 25 per cent. ahead of last year. Collections are fair and the prospects for trade good. We account for the growth in trade over last year from the fact that our city is fast taking its place as one of the leading points for the distribution of goods, and we are constantly gaining new customers from territory that formerly we did not reach. Stocks of Hardware are large and well assorted. Bar Iron is selling lower here than at Southern competitive points, and as this is as in some sense taken as a test of

the market by purchasers, it has helped us to build up a trade that under other circumstances would have required more time. We see no immediate prospect for an advance in Bar Iron, nor do we see anything threatening ahead. Prospects for building good. We anticipate more building this year than at any period in the history of our city. It is too early to say much as to agriculture in this part of the South, since small grain does not amount to much here and the corn and cotton crops are just planted. The farmers are disposed to practice economy and exercise their usual diligence, and we may hope, with favorable weather, for good prospects. Most of the farmers are men of limited means and many of them are in debt—not more so than formerly, however, and the prospect may be said to be good. Our merchants have formed an association with a view to watching freight rates closely and other bearings that the railroads may have in affecting trade at this point in the way of running trains in and out of the city, &c.

**MOBILE.**—General business has been, and still continues, good for this season of the year, and from general reports has been equal to the past few years, if not better. Hardware business is also satisfactory, especially in Mill and Agricultural Supplies. Stocks of Hardware are fully equal to present demands. June 1 being the end of financial year they are naturally lighter than during the regular seasons. The disposition is to obtain a fair margin of profit, but this depends upon the desire of competing points to cut, which we regret to say is very frequently done. The prospects are that trade for the next few months will be very quiet, and naturally so as being between seasons. The prospects for building are very flattering. More improvements than usual are in hand, and it is expected an unusual activity will prevail during the coming summer months. Agricultural prospects are bright, and this has tended to uphold business in this section. It may safely be said that the best start has been made for five years. Collections have been satisfactory in measure, but it will be necessary to grant some extensions until fall, the same being well secured. Our salesmen representing us in the States of Florida, Mississippi, Georgia and Alabama report encouraging prospects for the coming season, and taking a general view of the situation, with no disastrous crops, we anticipate a large and healthful trade for the next year.

## Florida.

Trade has been rather quiet the last few months, and now that the dull season is commencing is falling off. The volume of business does not come up to former years, the effect of the yellow fever which prevailed last year being more or less seriously felt. Collections are only fair and are generally reported hard to make. If all goes well the present summer it is expected that there will be an excellent trade in the fall. The reports from other merchants are confirmed by the following from a well-known house in JACKSONVILLE:

Trade is slackening in all lines, and will be very dull during the next three months. The volume of business done does not come up to last year on account of the yellow fever last summer. Hardware merchants are running down their stocks, getting ready to take inventory in July. Prices in the main have been good, though there has been some cutting on staple goods. There is not much building going on and the outlook is not encouraging in that line. A few brick blocks and some small frame houses are, however, being put up. The early vegetable crops throughout the State have commenced to move. The crop is large and good prices are realized. Collections have been very fair since the epidemic last summer and are better than we anticipated. Our salesmen have had a good trade during the past three months. They report business slackening up throughout the State and that farmers have good prospects for good crops.

## Tennessee.

Both wholesale and retail trade appear to be in good shape, and it is a significant fact that the travelers from whom advices have been received refer to their business as having been more satisfactory than in many other States. Stocks of goods are well assorted and of about the usual size, perhaps on the whole a little larger than last year. The volume of business during the past season was satisfactory and but little fault is found with collections. The agricultural outlook is good and our advices generally are of an encouraging tenor; but, as reflecting the condition of things

through the State, we give below abstracts of reports received from some of the principal points. From CHATTANOOGA our advices are as follows:

Trade in general is fairly good and our Hardware business has been good since January 1, but is now quiet. In this section we have had exceptionally fine weather, which has induced country merchants to buy early. Stocks are fairly full, but not unusually large, and prices are low and irregular. Heavy goods appear to be weakening. The prospect for trade during the next few months appears to be tolerably good, and the outlook for building in Chattanooga and some of the neighboring towns is pretty fair. Crop prospects are also promising. Farmers and merchants appear to be in fairly good condition, as a general thing, and collections are thus far satisfactory. This section appears to be attracting the attention of Northern and Eastern capital, which will do much to develop our large mineral and agricultural interests.

From a well-known house in NASHVILLE we have the following report:

Business has been excellent since January 1, and our sales largely exceed those of 1887 or 1888, and payments are equally satisfactory. This State, especially the western part, is in excellent financial condition. Many new merchants have entered the field, and all seem to think the present year will have a very fine business. Hardware stocks are light. Prices have been low, but sales have more than made up the difference. We expect trade to be quiet until July 1, but are having, however, a nice demand for goods. Our country is growing, and every one has faith in its future. This is the country for young men, and small capital judiciously managed can be made to yield good profits. Salesmen report that their sales have been heavy this year. There have been but few failures.

From KNOXVILLE a prominent concern writes:

Business in general is very good and Hardware better than we have ever known it, because of the amount of building in prospect and process, the opening of new mines and the building of new railroads. Stocks of Hardware are about as usual. There is little complaint in regard to the cutting of prices. Agricultural prospects are unusually good, but collections are slow at present. They have, however, been good until within a few weeks. Traveling salesmen appear to be well pleased with the business they are doing, considering it is rather between seasons.

#### Minnesota.

General business during the year thus far has been a little slow and less in volume than usual, though from a few points, owing to special local circumstances, a much more active market is reported. This depression in trade, if it may be characterized by this term, is induced in good measure by the fact that the crops for the past two seasons were unsatisfactory, having been partial failures, so that, as a rule, the farmers have but little money. The decline in the price of wheat and the continued depression in the price of cattle also tend in the same direction. In this condition of things there has been only an average business in Hardware. Our correspondents, however, advise us that at the time of writing prospect for crops was good and the outlook for trade very satisfactory, though it will naturally be quiet until after harvest. In the cities there is a fair amount of building, but throughout the country generally comparatively little. Stocks of Hardware are below the average, the condition of the market at large and features of business in the State not having induced as liberal purchases as usual. With a good crop there is every indication of an excellent business in the fall, and the meager stocks in the hands of the trade would need extensive replenishing. The situation is thus summarized by a prominent jobbing house:

Business in general has been a little slower than usual at this season, but the spring trade has been quite satisfactory. Stocks of Hardware are about a fair average, and the outlook for trade during the next few months is good. More building is in progress or projected in the city of St. Paul than was ever before known. Everything looks favorable now for a good crop, but it is too early to prognosticate with any certainty. Collections are slow.

Other points are given in the following from another well-known house:

Farmers have very little to sell, crops having been partial failures for the last three years. The spring has been dry, thus retarding lumbering operations. Hardware is no exception to trade in general and is dull. Stocks of Hardware are light and there is little disposition to buy. Prices have been thus far much depressed, salesmen being inclined to cut. We do not look for much improvement until the crop prospects become apparent and are favorable. We hear but little about building and consider the prospects poor. It is too early in the season to say much about agricultural conditions. Considerable winter wheat was sown, but we think the weather has been unfavorable. Collections can be said to be fairly good.

#### Missouri.

Trade both in general business and Hardware has been very satisfactory thus far this year, nearly all our reports thus characterizing the condition. January and February business was in excess of the same months last year, but in March there was a falling off as compared with March, 1888, but April has been a decided improvement. A number of merchants refer to the year's business as in advance of preceding year by considerable percentages, while from some points business is referred to as about average, but with evidences of improvement in some respects. The prospect for future business is regarded as excellent, though this is, of course, largely dependent upon crops, which are, however, referred to as promising well, the indications pointing to an exceptionally large yield. Several of our correspondents allude to the prospects for winter wheat, corn, fruit, &c., as never having been better, and this condition of things following the good harvest of last year induces a hopeful feeling. As the winter was an open one opportunity was given for a good deal of building, and there is a fair amount now going on, with more in contemplation. In some places, however, there is not much activity in this direction. Stocks of Hardware in hands of retail merchants are rather small but well assorted, and a good deal of conservatism is observed in buying, their orders covering only their actual wants. Collections are fair to good and are evidently easier than in many other parts of the country. Taken all in all, trade in Missouri is in a healthful condition and anticipations are generally entertained of an excellent fall demand. Business in St. Joseph is in excellent condition, and the prospects for this center are regarded as very promising. The following report covers the features of business in KANSAS CITY:

There has been no decided increase in the volume of business thus far in '89 over '88, but a slight general improvement has been noted. Stocks in the hands of retail merchants are small and lighter than for several years. Prospects are for a better trade during the summer months, and jobbers anticipate a large fall business. Building is going on steadily. The growing crops are in excellent condition and indications are for the largest crop we have ever had. Collections are fair and traveling salesmen report prospects as good.

This review of the business in the State may appropriately be supplemented by the following careful report from a leading St. Louis house:

In regard to the general business condition of this locality we do not consider the situation very flattering, and have heard many complaints from many lines of business in regard both to the volume of trade and the prices. The Hardware trade seems to have been better than the majority of the other lines, and we cannot with justice find much fault with the volume of our spring business. Hardware stocks are generally small throughout the country, and it occurs to us that the average country merchant does not carry, as a rule, as heavy a stock of merchandise as he formerly did. The tone of the market as regards prices is very discouraging, but as it has been getting worse from year to year for a long time we have almost ceased to grumble. We cannot see that there is anything very promising in sight for the near future. The heaviest demand for

building material is over, the mild winter enabling carpenters to begin work much earlier than usual. The condition of the crops in this vicinity is good and ought to enable the farmer to save some money. Collections are only fair, and it requires constant reminders to bring them to time. It is well that we do not have to rely on one section of the country only. The conditions are very different in different localities. Some territories are good and promising more, others the reverse. There is nothing that we know of that will cause any great increase in the volume of trade, but the country tributary to this city is being settled more rapidly and commanding more attention than ever before and we look to that to create a healthy demand for goods.

#### Arkansas.

Reports from Arkansas are satisfactory and indicate a healthful condition of things. There is no general complaint of dull trade, the volume of which is up to reasonable expectations. The future course of business depends mainly on the crops, of which it is too early to form as yet a reliable estimate. The following report refers to the situation more in detail:

Business in general is in a healthy and thriving condition, with few complaints of dull trade. A splendid spring business has been done in Hardware, but the demand is now slackening up. Stocks are fair but not large, and are pretty well reduced by spring trade. A good deal of cutting in prices is going on, but taken as a whole they are fair. Trade will necessarily be quiet for the next few months, as is always the case in the Southern country. The prospects for building are good. New buildings are going up all over our State. Agricultural conditions as affecting trade are good, and collections to this time have been fair, but we may expect them to begin to be slow from this on until the new crop comes in, especially in the rural districts. Farmers are all busy putting in their crops, and we cannot tell much about the prospect of the year.

#### Kansas.

Trade in general is rather dull, and the volume of business thus far is not up to expectations. A similar remark may be made in regard to Hardware, which, like other lines, is quiet, with no prospect of improvement until after harvest. The purchases of the trade during the past few months have been for the most part limited to small quantities and for goods needed, without attempting to anticipate future wants. The reports given by travelers are not especially good, and they state that with their best efforts it is difficult to keep the volume of sales up to the average. The course of future trade depends almost entirely upon the result of the harvest, and it is generally agreed that if the crop is good there will be an exceptionally satisfactory business in the fall, and it is gratifying to note that the reports indicate almost universally that at the present time the outlook is especially good, crops of all kinds being in fine condition. The opening of Oklahoma has stimulated trade along the border, and, it is hoped, will give an increased business in the future. Farmers have but little money, and collections are slow and difficult. The general conditions, while trade is not as active as might be desired, are, however, regarded as healthful, and as affording a basis for a good business in the future, and, as stocks of Hardware are generally rather below the average, it is expected that when business revives a very satisfactory trade will be done, which will call for a prompt and general replenishing of stocks. We give below an abstract of two reports, the first from a representative retail merchant, and the second from a well-known wholesale jobbing house:

I do not hear of any line of business that reports good trade. Those who have had a fair volume complain of small margins. Hardware for a large section of country is very unsatisfactory as to amount and profits. Stocks generally are small. Buying is for sorting more than for stock. While prices are not demoralized, desirable customers undoubtedly are able to get goods under the general market. The crop prospects are better than any spring for a number of years, but money is not in the country to trade with. A good deal of caution is exercised in regard to

credits. The extent of building will depend on the coming season's crops. The failure of a large part of the crops for the last two years has been more injurious than merely the loss of the crops, as immigration has been greatly checked. All things considered collections are fair. Traveling salesmen are comparatively scarce and few report any increased sales. The drummers who used to call in 30 to 60 days one or two years ago have not been here in months. The future trade depends entirely on coming crops, which have a good showing now, so that there is good reason to expect a good fall business.

Business is light in all lines, as well as in Hardware. Stocks are good, and may be regarded as large for the conditions of trade. Prices are low and steady and margins small. The probability is that spring and summer trade will be light. The outlook for crops would indicate a good or at least an increased fall trade. The prospects for building are only moderate. Crops were a partial failure last year, but the outlook this year so far is magnificent. Collections are pretty slow, but as good as could be expected. Traveling salesmen are hopeful for the future. The prospects for trade in Kansas and Nebraska are all right if we get a crop, otherwise not.

#### Nebraska.

Business in this State has been steady, and of volume equal to former years with generally very satisfactory conditions. Prices as a rule are holding their own, but there are no evidences of overstocking or demoralization of prices locally. There seems to be a disposition on the part of consumers to purchase carefully and the trade also have been conservative in not ordering beyond their requirements. About the only unfavorable condition to be noted is the low prices ruling for cattle and farm products generally, but last year crops were excellent and the prospects for this year's crops are uniformly reported good, the ground being in excellent condition, so that the outlook in this regard is considered especially favorable. A large proportion of last year's crop is still in the hands of the farmers, who are holding it on account of the low prices ruling. An influx of immigrants is reported throughout the State. There will evidently be a large amount of building, especially in the cities and large towns. Collections are fairly good, and consumers are reported as owing less to dealers than for some years past, though from some quarters collections are referred to as below average. The general impression received is, however, that they are reasonably good. In this condition of things a satisfactory business is expected during the summer, and especially an improved demand in building Hardware and Tools.

#### Dakota.

In sympathy with the condition of general business, Hardware is dull, there being a disposition to wait until the crops for this season are harvested. Sales during the season have been below the average and trade has been in most instances sluggish, with reports of fair activity in some points where local conditions are favorable. The outlook for the crops is promising, but it is too early to predict with confidence; the general impression prevails that if they are good there will be an exceptionally active trade in the fall. Collections have been on the whole rather poor, but some of our correspondents state that in the fall of 1888 and last winter collections were exceptionally good, and many debts were paid and mortgages canceled. Prices are without special features, but have been to a good extent cut by merchants in order to induce sales. We receive advices from a number of points that business generally has been considerably demoralized by the territorial and local farmers' alliances, who endeavor to do business without the aid of merchants. The following additional advices in regard to trade in the Black Hills will be of interest:

General business has been better than in 1888 or 1887, and is in much more satisfactory condition as regards credit than ever before.

There have been more cash sales and shorter credits given. Hardware has been as good, if not much better, than other lines of trade. Stocks of Hardware are unusually small, owing to a good spring trade and the more conservative manner of buying goods, dealers having found that it does not pay to overstock. The prospect for trade during the next few months is good, and in this section there will be more building than any year since 1878 except 1886. Last year there were big crops and there is every indication of good crops this year. Farmers are gradually improving their financial condition. Collections are fair, being better than 1887 or 1888 and not as good as 1886. The prospects for mining developments are good, quarries are being opened up and some manufacturing industries started.

#### The Cut-Nail Extras.

The fact has occasionally been alluded to in our Western market reports that the practice is growing of making a low base price on Cut Nails, which is graduated according to the quantity of small Nails included in an order. Quite a number of Nail manufacturers had been in the habit of doing something similar whenever they found prices getting down to an unremunerative point. They insisted on their customers making up assorted orders to average a certain advance over the base, to get the benefit of the lowest price current. For instance, if the price of Nails fell to \$1.65 at the factory, they continued to sell, but they carefully watched specifications and made an average of 25 cents or 30 cents above base an essential requisite for the acceptance of the order. The new arrangement, however, is based on a scheme which is not so productive to the manufacturers. The old way erected a structure of possible profit on a foundation of unremunerative business. The new way cuts into the foundation still deeper and diminishes profits merely for the sake of making sales.

This new departure is perhaps merely an outgrowth of the times, and the depression of the Nail trade is more to blame for it than the manufacturers who are charged with its parentage. The Bar-Iron manufacturers passed through a similar experience just about a year since, when their card of extras was cut in two by the formal announcement of a prominent firm, who merely did openly and above-board what their competitors were doing, and had been doing quietly, but almost universally. The Bar-Iron extras were attacked by the manufacturers themselves, because in comparison with the base price for Iron they were undoubtedly high, and presented a tempting opportunity to be used for bait to catch an order. The progress of the times had outgrown the old card of extras, and no single concern was really responsible for the revision which was thus forced. The changes of the future will probably tend to the further reduction of such extras rather than their restoration to the old figures. The Cut Nail extras are susceptible to the same influences, and are being affected by the same cause. A level of prices will be struck which will appear to establish a more natural relation between low base rates and extras for small sizes, and there the movement downward will halt for a time, as in the case of Bar-Iron, unless the power of the combined Western manufacturers can restore the old conditions, which does not now seem probable.

This new method of selling Nails has injected into the trade some very annoying features to jobbers and retail merchants. All are, of course, anxious to get the lowest base prices, and they consequently order assortments, including the necessary quantity of small Nails, to cover the requisite average above the base. The jobbers are enabled to do this with somewhat of ease, as they handle large stocks of every size. Retail merchants, however, load themselves up with small Nails enough to last for some time, but soon run out of large Nails, and are then in the

market for base sizes. They apply to jobbers for small lots of such sizes, and find that their trade is regarded as undesirable, because the jobbers are obliged to take care of their regular customers who are purchasing assortments. Jobbers are now instructing their salesmen to be very careful in making sales of Nails for this reason.

The manufacturers are discussing this new phase of the Nail situation with much interest, as they see in it the threatened destruction of their only opportunity to get a profit from the sale of Nails. The reduced cost to dealers of the smaller sizes of Nails may restore to the Cut-Nail trade a large part of the business which has been wrested from it by the Tack and Wire-Nail makers, but that would be a barren victory if it were accomplished by the total sacrifice of profits. It is by no means regarded as a compensation for the loss to be sustained. Some of the manufacturers suggest the adoption of a certain price for each size of Cut Nail, so that a dealer can buy what he chooses and just as large a quantity of each size as he desires, without reference to any other sizes in his order. Predictions are being made now that the Cut-Nail trade will adjust itself on a basis of this kind or something approaching it within the next six months.

#### Miscellaneous Prices.

The following is the new association price list of inside Iron Strapped Blocks, which was adopted by the manufacturers, to go into effect after May 1. The discount applying to the rest of the list applies to this new list also:

#### Inside Iron Strapped Blocks.

Size.	Mortise.	Iron bushed.			Roller bushed.		
		Single.	Double.	Triple.	Single.	Double.	Triple.
3	9-16	\$0.70	\$1.30	\$1.75	\$1.10	\$2.00	\$2.90
3 1/4	9-16	.75	1.45	2.00	1.15	2.20	3.15

Walter Coleman & Son, Providence, R. I., have issued the following new and reduced list of Iron Sheaves for Tackle Blocks. As the dimensions of the Sheaves are well known they are referred to by numbers, the number being the size of the Block that the Sheave fits. The Common Sheaves are subject to a discount of 30 per cent., and the Patent Sheaves to a discount of 45 per cent.

Number.....	3	3 1/4	4	4 1/4	5	6
Common; new price.....	\$0.05	.05	.06	.08	.10	.12

#### Items.

John Wilson, the well-known manufacturer of Butchers', Skinning and Sticking Knives and Butchers' Steels, Shoe Knives, &c., Sheffield, England, has appointed Hermann Boker & Co., 101 and 103 Duane street, New York, his sole agents

for the sale of these goods in the United States, and he requests that orders either for importation or from stock be addressed to them. Hermann Boker & Co., referring to this announcement, state that they have accepted this sole agency and will carry a full stock of the goods on hand, while orders for importation will be filled as promptly as possible. This arrangement by which the efficient marketing of this leading line of goods will be secured, and the convenience of the purchasers thus served, will be appreciated by the trade. Formal announcements are made of this agency on page 70.

The Medford Fancy Goods Company, 44 and 46 Duane street, New York, who are, we believe, the only exclusive manufacturers of Dog Collars and Furnishings in the world, in their advertisement on page 80 call attention to the inducement they offer to the trade of first orders and refer also to the extent of their stock and the quality of their goods.

S. A. Munger & Co., Detroit, Mich., issue a price current showing the Otsego Farming and Garden Tools, Shovels, Spades, Wire Cloth, Screen Doors and Windows, Lawn Mowers, Refrigerators, Freezers and other seasonable goods.

The trade will learn with regret of the death, on the 20th ult., of Geo. R. Kelsey, president of the American Buckle and Cartridge Company, West Haven, Conn.

Hartman Mfg. Company, Beaver Falls, Pa., issue a neat pamphlet describing the Steel Picket Fence and Gates of their manufacture. Full description is given of this Fencing as constructed of heavy Steel Wire which cannot be broken, and is firmly held by steel posts driven deep into the ground and anchored there so that they cannot be uprooted. Other advantages possessed by this Fencing are pointed out, its beauty, durability, convenience and economy being emphasized. Different patterns of Gate, Corner and Line Posts are shown and a number of testimonials given. The Flexible Steel Wire Mat is also represented.

In these times when increased attention is given to elegant printing for trade purposes, the advertisement on page 53 of John A. Lowell & Co., Boston, Mass., will be of special interest. It calls attention to their engraving and printing, which, as well known, is artistic and of a high order. They also emphasize the fact that they are in a position to furnish original ideas by means of which their work may be made especially attractive and serviceable to their patrons.

The Ambler Saw Mfg. Company, Natick, Mass., issue a circular relating to their Band Saws and Band Saw Tools and Machinery. Their Band Saw Filing Machine is especially referred to and a list of representative houses using it given.

In their advertisement on page 68 the Holmes & Edwards Silver Company, Bridgeport, Conn., call attention to their Durham Silver Metal Spoons, Forks, &c., a line, it will be understood, of solid metal goods unplated. This is, we believe, the original brand of this class of goods, and the company allude to the success which has attended its sale, and the uniformity of the quality and finish.

It will be seen that in their advertisement on page 81 C. F. Guyon & Co., 99 Reade street, New York, call attention to their extensive line of agencies, and illustrate the Pin Tumbler Rim Latch made by the Brooklyn Lock Company, for whom they are representatives.

John R. Scott has opened a retail Hardware store at 112 Randolph street, Chicago. He will carry a general line, but will pay special attention to Builders'

Hardware, Cutlery and Tools. Mr. Scott was connected with Kellogg, Johnson & Bliss for 12 years, having been a partner for the last three or four years of the connection, and during the past year he was one of the managers of the Chicago branch of P. & F. Corbin. He is thus well equipped to handle the trade of contractors and builders.

William Willer, of Milwaukee, Wis., has issued a price list for the spring of 1889 covering the Willer Sliding Window Screens and custom-made Screen Doors manufactured by him for fine residences and other buildings. His Sliding Screens are balanced by springs and can be moved to any part of the window, remaining wherever placed. They are made in a variety of styles and of all sizes. The circular shows a large number of designs of Screen Doors, from plain patterns to very ornate frames, each design being numbered for facility in ordering. They will be furnished in all the usual kinds of wood, covered with black wire cloth, or will be covered with other cloth if specially ordered.

The American Folding Chair Company, St. Louis, Mo., issue a collection of illustrations made by photographic process of their Settees and Chairs for lawn use. They allude to their line for this year as superior to any they have yet manufactured.

Among the business opportunities announced on page 59 those looking for such an opening will observe an advertisement relating to the sale of a Hardware house with an established business, in West Massachusetts. The stock carried is mentioned as about \$30,000, and the desirability of the opportunity is alluded to.

Dame, Stoddard & Kendall, Boston, Mass., in their advertisement on page 78 make, it will be observed, a seasonable announcement in regard to Fishing Tackle, and illustrate Skinner's Fluted Trolling Spoon Baits, and call attention to leading lines of Fishing Tackle, &c., for which they are agents.

The trade will observe the advertisement of Henry Disston & Sons, Philadelphia, Pa., occupying page 73, in which they illustrate some of their leading Cross-cut Saws, and call attention to their special features, the method of manufacture, &c.

We are advised by the Toledo Block Works, Toledo, Ohio, that they have appointed J. C. McCarty & Co., 97 Chambers street, New York, their agents for the sale of their Tackle Blocks, who will carry a stock for the convenience of the trade and will be prepared at all times to name the manufacturers' list prices.

An announcement of some unusual interest is made on pages 84 and 85, in which Morley Bros., East Saginaw, Mich., call attention to their new catalogue of about 1000 pages, and state that they will send it with a shipment of \$100 worth of shelf goods or goods of their own manufacture. The arrangement of this catalogue, covering Hardware, Tin-Ware, Wagon Stock, Mill Supplies and other lines, makes it especially desirable, and the trade will appreciate the opportunity of having such a book. An interesting illustration is also given of their different stores, warehouse, factory, &c.

#### Arrangement of Stores.

Our attention has been called to a number of excellent devices for arranging stock which have originated with J. F. Wollensak, 227 Lake street, Chicago. Prominent among them is a case for holding retail stocks of Screws, Rivets, Escutcheon Pins, Trunk Nails, Machine Screws, Copper Washers, and all small articles of that kind which require a great deal of room when they are kept in com-

plete variety. This case is illustrated below, Fig. 338. The case is constructed in sections, each section containing two large drawers or slides, as shown in the cut. The top is used as a desk or counter. The slides are mounted on rollers such as are used for theatrical scenery, so that they can be moved in and out easily. Each

Fig. 338.—Screw and Rivet Case.

slide is fitted with shelves to suit the proposed contents. Screws are kept in the sample-case shown. The shelves are made of  $\frac{1}{4}$ -inch pine and have no upright partitions, the small drawers fitting up closely against one another. These drawers have leather pulls attached to them instead of Screw Eyes, as the latter, being rigid,

Fig. 339.—Case for Tubing.

might be bent or knocked off in pushing the slide in or pulling it out. The shelves are placed  $1\frac{1}{2}$  inches apart on the top four rows of small drawers,  $1\frac{1}{4}$  inches apart on the next four,  $2\frac{1}{4}$  inches on next four and  $2\frac{1}{2}$  inches apart on the lowest four. The number of drawers ranges from nine on the top shelf to five on the lowest. The drawers are made of thin wood, with

Fig. 340.—Method of Arranging Adjustable Shelving.

a slight taper toward the back, so that they will slide in easily, but they could be made of paper. Each drawer is, of course, properly labeled and each is calculated to hold a paper of Screws, with a little margin in addition. It will be seen that the goods are doubly protected from dampness and dust. Flexible Tubing, or Gas Hose, has been found

somewhat difficult to keep properly, because of its length and its liability to "set" if coiled for any length of time. The plan adopted by Mr. Wollensak overcomes all objections. He has had a case of drawers made, as illustrated above, Fig. 339. The case is 6 feet 6 inches long, 36 inches wide and 38 inches high, and the drawers are nine in number, each 9 inches high by 10 inches wide, and they slide in at the end of the case, so as to extend its whole length. They thus accommodate the Tubing laid perfectly straight in the usual 6-foot lengths. The Tubing being flexible, yet stiff enough to push into the drawers easily, it is not necessary to have room enough in front of the drawers to pull them out far when taking out goods or storing them away. The top of the case is used as a counter.

The space on the floor under shelving is usually wasted, as it is an undesirable place to store goods, on account of the dust and dirt. Mr. Wollensak utilizes this space for boxes made to fit up close to the shelf above and mounted on heavy double-roller casters. In these boxes heavy goods are carried. They are easily rolled out on the floor when access to their contents is desired, and they can be wheeled to other parts of the store to be filled or emptied. One upright is used to every two boxes in this store, instead of partitions at the side of each one. A system of shelving, Fig. 340, adapted for broken or mixed stocks, is very ingenious, and would be desirable in quite a number of cases in which fixed shelving is used. The uprights are made of  $\frac{1}{2}$ -inch boards, with a series of shallow cuts made across them by a rip-saw, these cuts extending from the bottom to the top of the uprights, just  $1\frac{1}{4}$  inches apart. The uprights are placed  $1\frac{1}{2}$  feet apart, and between them the shelves extend, which are made of No. 14 sheet iron, cut to fit nicely and japanned, so as not to rust. These shelves can be moved by means of the cuts in the uprights so as to leave any desired space between them. Small packages can thus be placed separately on the shelves instead of being piled up, as would be necessary with fixed shelving. No space is wasted, as the shelves are so easily shifted to suit the size of any kind of a package.

#### Exports.

PER BARK REBECCA CROWELL, APRIL 11, 1889,  
FOR BRISBANE, QUEENSLAND.

By H. W. Peabody & Co.—11 packages Hardware, 20 cases Fire-Arms, 11,238 pounds Barb Wire, 53 packages Hardware, 13 crates Stoves, 12 dozen Handles, 10 packages Lampware, 1 case Wringers, 22,474 pounds Barb Wire, 3 packages Road Machinery, 1 case Steel.

By A. S. Lascelles & Co.—44 dozen Axes, 6 dozen Picks, 17 cases Handles, 3 cases Hardware, 20 dozen Hatchets, 16 dozen Hammers, 6 cases Scales, 1 crate Trucks, 1 box Wheels, 100 boxes Clothes Pins, 10 dozen Wash-Boards,  $\frac{1}{4}$  gross Grease, 8 cases Tacks, 280 pounds Nails, 13 dozen Wrenches.

By F. B. Wheeler & Co.—1 case Buggies and 1 pair Shafts, 300 dozen Handles, 120 dozen Handles, 86 dozen Handles, 5 cases Buggies, 5 pairs Shafts, 2 cases Buggies, 2 pairs Shafts, 5 cases Axes, 2 cases Tumblers, 13 gross Cow Bells.

By Coombs, Crosby & Eddy.—50 dozen Handles, 1 dozen Wheelbarrows.

By Winchester Repeating Arms Company.—24 Guns, 20,000 Primers, 1020 Metallic Cartridges.

By R. W. Cameron & Co.—10 dozen Handled Axes.

By V. Basanta.—5 dozen Mattocks, 220 dozen Slates, 10 gross Toy Pistols, 9 dozen Door Springs, 5 cases Tacks, 12 dozen Locks, &c.

By Arkell & Douglas.—30 dozen Edge Tools, 3 Ranges, 5 dozen Edge Tools, 35 cases Edge Tools, 25 dozen Wash-Boards, 24 dozen Wash-Boards, 10 cases Axle Grease, 10 crates Polish, 10 dozen Edge Tools, 10 gross Blacking, 2200 feet Hose, 2 cases Hoes, 2 barrels Blocks, 2 cases Axle Grease, 763 pounds Bolts, 7 packages Hardware, 13 cases Lawn Mowers, 600 feet Hose, 36 crates Refrigerators, 6 crates Stoves, 19 packages Hardware, 48 cases Edge Tools, 6 cases Handles, 5 cases Bolts, 58 cases Handles, 6 crates Shellers, 42 packages Hardware.

#### Business Changes.

The well-known house of J. C. McCarty & Co., 97 Chambers street, New York, has been reorganized, as per the following announcements:

NEW YORK, May 1, 1889.

Notice is hereby given that the copartnership heretofore existing between the undersigned, under the firm name of J. C. McCarty & Co., expired by limitation on the 30th ult., and that all accounts due the late firm are to be adjusted with and be paid to the new firm of J. C. McCarty & Co., formed this day as stated below.

J. C. McCARTY,  
W. H. LITTELL,  
T. P. BURKE,  
JAMES SURPLESS.

NEW YORK, May 1, 1889.

Referring to the above notice of dissolution, the undersigned beg to inform their friends and the Hardware trade generally that they will continue the business of Hardware manufacturers' agents from this date at the old location under the firm name of J. C. McCarty & Co., and they respectfully solicit a continuance of the confidence and patronage with which they have been honored in their former relations.

J. C. McCARTY,  
W. H. LITTELL,  
T. P. BURKE.

The business will thus be carried on without change of name and with the same lines of agencies representing many of the leading kinds of Hardware.

Connected with the above change we have this announcement in regard to a new firm under the style of Surpluss, Dunn & Alder:

NEW YORK, May 1, 1889.

The undersigned have this day formed a copartnership under the firm name of Surpluss, Dunn & Alder, at 97 Chambers and 79 Reade streets, for the transaction of the Hardware commission business. Trusting that our old friends will remember us in our new departure as they have in the past, we are

Yours truly,

JAMES SURPLESS,  
ROBERT W. DUNN,  
BENJAMIN S. ALDER.

Of these gentlemen Mr. Surpluss was a member of the firm of J. C. McCarty & Co., and he and his partners in the new firm have been connected with the Hardware trade for a number of years, so that they are widely and favorably known. They enter upon their commission Hardware business under promising auspices, representing the following well-known manufacturers, whose products include, it will be observed, a varied line of leading goods:

The Gutta-Percha and Rubber Mfg. Co.,  
Capitol Mfg. Company,  
H. Chapin's Son,  
Keystone Lock Works,  
Lindsay & McCutcheon,  
Cronk Hanger Company,  
Chadborn & Coldwell Mfg. Company,  
The Western Block Company,  
Nes Chain Mfg. Company,  
Champion Blower and Forge Company,  
John Auer, Jr.

Their announcement giving further particulars in regard to their agencies, & mentioning that they give special attention to the export trade, will be found on page 82. In these new departures both J. C. McCarty & Co. and Surpluss, Dunn & Alder will have the best wishes of the trade for their success.

#### Inaccuracy in Designating Chain.

With reference to the tendency on the part of manufacturers to designate Coil and other Chains inaccurately, as the Chain is made larger than the size for which it is sold, we have the following communication from one of our correspondents, in which the mischief of this practice is alluded to and an earnest appeal made for a return to accuracy in this regard:

We are much interested by the discussion of the nominal and real size of Coil Chain in your issue of April 4. There is

no question but that, starting possibly with the small difference of  $\frac{1}{16}$  larger than the marked size, this fraction has grown, as your correspondents themselves acknowledge, through various stages,  $\frac{1}{8}$  into  $\frac{1}{4}$ , so that in many cases the  $\frac{1}{4}$  Chain measures  $\frac{1}{2}$ ;  $\frac{1}{2}$  measures  $\frac{3}{4}$ ;  $\frac{3}{4}$  measures  $1$ , or so slightly scant as to be hardly appreciable by instruments even of accurate measure. That this is wrong is readily acknowledged by the very ones who are parties to the fraud or attempted fraud. It would be just as ridiculous to call No. 4 Iron (whose diameter is, as your correspondent says, 0.238)  $\frac{1}{2}$  and attempt to sell it for  $\frac{1}{2}$ , to be cut by  $\frac{1}{2}$  dies and fit  $\frac{1}{2}$  Nuts, as to attempt to pass off Chain of that diameter for  $\frac{1}{4}$ . It would be equally absurd to sell a 9d Nail for an 8d Nail. In short, the practice or deceptive making or marking should not be tolerated by either consumer or handler. This way of cutting price by furnishing wrong sizes meets its parallel in certain other trades. In dry goods, for instance, up to recently a bolt of ribbon marked 12 yards had been gradually reduced in length till the ribbon thereon measured only 10 $\frac{1}{2}$  yards. But this discrepancy became so glaring that the labels themselves are now stamped 10 yards; 10-4 wide goods are barely over 9-4; 24-inch silks run 23; 2-yard table linens are scant from 3 to 4 inches, but the writer is assured by the shoppers in his family that this practice is being steadily discountenanced more and more until the label is beginning to nearly represent the actual measure. Deception must of necessity be short-lived, and it is wholly unworthy of those engaged in the manufacture or dispensing of Hardware to lend themselves to any device so unworthy of goods where really mathematical exactness ought to govern. A 6 $\frac{1}{2}$ -6-2 Trace should mean exactly what it says. Those manufacturers who can make and sell with equal readiness a Chain five links to the foot should sell it for five links and establish a difference in price between the two. A  $\frac{1}{4}$  Tire Bolt, too, might well be  $\frac{1}{4}$ , not  $\frac{1}{2}$  scant.

Let every one set his face against what he must condemn in a moment of serious thought, and the complaints which are fully justified under the present conditions will disappear. By French law any article that might be mistaken for something more valuable must be marked "imitation." We hope the day is far distant when any such label could be justified on American Hardware. If "a just weight is a delight" to the Almighty, we take it He looks with equal favor on a Chain properly calipered or gauged.

#### FRACTION.

The territory of Oklahoma, as defined by the Springer bill, includes Oklahoma proper, "the Cherokee Outlet," and the so-called "No Man's Land," or "Public Land Strip," and is bounded as follows: On the west by Texas and New Mexico, on the north by Colorado and Kansas, on the east by the reservation occupied by the Cherokee tribe of Indians east of the ninety-sixth meridian of west longitude and by the Creek, Seminole and Chickasaw reservations, and on the south by the Creek, Seminole and Chickasaw reservations and by Texas. Its acreage is as follows: Cherokee Outlet, 6,022,244 acres; Public Land Strip, 3,672,640; Oklahoma proper, 1,887,800. That portion of these lands just opened for settlement by proclamation of the President lies very near the center of the Indian Territory.

Contracts for the manufacture of nine iron oil tanks of 40,000 barrels each for the Globe Refining Company, the Standard's rival, have been awarded. The tanks will be located on the Delaware River front, where a large plant is in course of preparation.

### Barn-Door Latch.

Johnson & Co., Marysville, Ohio, are inviting the attention of the hardware trade to what they designate as the Steel-Plate

Fig. 1.—Position when Door is Closed.

barn-door latch, for which they claim it is the only barn-door latch that can be opened or locked from either side of the door. Among the other advantages also claimed is that it will allow the door to shrink or sway  $\frac{1}{4}$  inch and still perform its function. The round hole shown in Fig. 1 is for the purpose of hanging the lock when not in use, and does not interfere with the handle when opening the door; the latter can also be securely locked on the inside with a nail placed over the catch as shown in Fig. 2 and the outside by means of a padlock inserted through the hole in the catch. It is claimed that when locked from the inside it cannot be opened from the outside by any device, thereby

Fig. 2.—Position of Catch on Post.

affording absolute security and protection. The material used is described as the best steel plate procurable, giving great strength and durability.

### Wire Sash Lift.

The illustration herewith given represents the Climax wire sash lift, which is put on the market by the Van Wagoner

Wire Sash Lift.

& Williams Company, 82 Beekman street, New York. It has, it will be observed, a single loop, and thus differs from the Gem,

which is made with a double loop. It is especially adapted for window screens and as a pull for screen doors. It is furnished coppered, walnut bronzed, nickel-plated on brass, or in brass.

### New Corkscrews.

The accompanying illustrations represent additional patterns of corkscrews which are put on the market by James D.

Fig. 1.—Self-Extracting Corkscrew.

Frary, Meriden, Conn. Fig. 1 represents a self-extracting screw, the cut being half size. It is so constructed that it is to be turned until the flange reaches the cork, when, by continued turning and a slight pull, it is stated, the hardest cork can be extracted. It is made either bronzed or in full nickel-plate. Fig. 2 represents a spiral twist corkscrew with pick or wire

Fig. 2.—Corkscrew with Pick or Wire Stripper.

stripper. This also is made bronzed or full nickel-plate.

Who shall dig the Nicaragua Canal is a question now before the courts. The American Atlantic and Pacific Ship Canal Company, through their attorney, have given notice to the Maritime Canal Company, of Nicaragua, that they will apply to the Supreme Court for a permanent injunction upon this work, contending that the State of Nicaragua granted to Cornelius Vanderbilt and other citizens of the United States the exclusive right of constructing a ship canal across its territory.

### The Blackmore Pipe-Hanger.

A new style of pipe-hanger which embodies a number of valuable features is being manufactured and offered to the trade by

Fig. 1.—General View of Hanger.

G. C. Blackmore, 152 Central avenue, Newark, N. J. The two illustrations presented herewith so clearly show its features of construction that only a few words of description will be necessary. Fig. 1 shows the pipe-hanger ready for use, while Fig. 2 shows it with the parts separate. The hanger consists of a hinged stirrup made of cast iron supported by a double hook of the same material, this in turn screwing on to a lag-screw of wrought iron. The upper portion of the lag-screw is cut with a large thread, suitable for screwing into wood, while the lower end has a  $\frac{1}{4}$ -inch pipe thread cut on it. The bottom of the lag-screw screws into the socket of the double hook, which is threaded on the inside. The lag-screws are made 4, 6, 9 and 12 inches long; while if any intermediate length is required a screw can be cut off and threaded with an ordinary pipe-fitter's die. At present the hangers are made in four sizes, adapted to 1,  $1\frac{1}{4}$ ,  $1\frac{1}{2}$  and 2 inches, but the manufacturer expects soon to make them in all sizes up to 6 inches. The method of supporting the stirrup by

Fig. 2.—Hanger with Parts Separate.

cast-iron hooks permits of a horizontal motion of  $2\frac{1}{4}$  inches. In referring to the special merits of this device the manufacturer alludes to the fact that there is no bolt to wear through and drop the pipe; and also that the material from which it is made renders it very cheap. The hangers can, of course, be finished in any manner desired.

**Cliff's Seat Spring.**

The accompanying illustration represents this article, which is put on the market by Titus & Babcock, Rochester, N. Y. As shown in the cut, it will be observed that the manner in which it is constructed does

means of this leg the lamp is raised about 3 inches from the table. As will be seen, the legs have a slight flare, which gives to the lamp greater firmness and rigidity, rendering it less liable to be overturned. The company furnish these legs separate from the lamps, and they are so simple of

Cliff's Seat Spring.

away with the hinge or knuckle found in other springs, the ends being simply riveted together, and it is to be noted also that it is a graduated seat spring and adapted for one, two or three persons, doing away with the necessity for carrying more than one size in stock. It has also, it will be seen, a chair above and below, which greatly facilitates its attachment, as it can be bolted directly, without fitting a wooden piece, to the seat to which it is applied and the board to which it is fastened. It is described as made of the best quality of steel, and as being soft and easy in its action and in all respects satisfactory.

**Novel Stove Leg.**

The American Oil Stove Company, of Gardner, Mass., are bringing out their lamp stoves provided with a very simple yet effective leg, the construction of which cannot fail to command the attention of the trade. The company have been engaged for some time past in devising a leg which could be easily and rapidly taken off and put on to their lamp stoves, and in the device which is shown in the accompanying engraving they feel that they have accomplished the object sought. As will be seen from the cut, the top of the leg catches on to the small ribs on the top

construction that they may be readily applied by any one.

**Crown Wire Coat and Hat Hooks.**

The illustration given below represents a style of wire coat and hat hooks called the Crown, which is put on the market by

Crown Wire Coat and Hat Hook.

the Van Wagoner & Williams Company, 82 Beekman street, New York. It will be observed that it differs in pattern from the Gem hooks and is offered at a somewhat

A Novel Stove Leg.

of the oil tank, while a stove bolt goes through the center of the leg at the rosette. To the end of this bolt is a nut which engages behind the small slot shown in the base of the oil tank. By

lower price. It is made in sizes 2½, 3 and 3½ inch, and also as a single hook in 2-inch size. They are furnished either coppered or japanned, and are put up half gross in a box or 12 gross in a case.

**Commercial Travelers Thirty Years Ago.**

We find the following interesting item in a recent issue of the *Crockery and Glassware Journal*:

"It amuses me," said the white-haired head of a jobbing house, "to hear traveling men nowadays complain of the hardships of the road, the taking of late trains, traveling in cabooses, and such like inconveniences. Lord bless you! they should have seen the drummers of the old days and heard their experiences and then they would have known something about the woes of the traveling man. Thirty years ago I was young, ambitious, full of energy, and went on the road for a jobbing house. When I could not travel by river—and that could be done only by going through a certain portion of our trade—stage coaches and horseback were the only means of travel. Many a cold and weary winter's day have I passed in the saddle, starting out early in the morning, going through snow or rain, fording creeks, and half frozen all the time, until I could hardly dismount when my day's journey was over. And then there were no banks or collection agencies through the country to facilitate the collections of debts, and

the drummers had all of that work to do. We traveled with old-fashioned valises, which could be used as saddlebags when we had to ride horseback, and these were the receptacles for what money was collected. It was sometimes pretty ticklish work stopping at lonely country taverns with saddlebags filled with good, hard money, but it had to be done. I slept on the floor in a little tavern office one winter's night with my valise under my head for a pillow, containing over \$1500 cash. It was a hard pillow, but I felt safer with it there, and slept quite soundly. The drummers of to-day don't know what hard traveling is. They should have frozen or half-drowned or starved with us in the old school back in the '50s."

After reading the first accounts of the destruction by floods of the famous Verrugas Bridge, on the Oroya railroad line in Peru, which was 260 feet high, and cost \$500,000, wonder was expressed that such a casualty could occur. Later accounts show that a "cloud burst" caused a mass of rocks and earth to sweep down the mountain, carrying away the bridge.

It is definitely announced that Presidents Adams, of the Union Pacific, and Perkins, of the Burlington, have signed a contract for the construction of a union depot at Omaha to cost \$1,500,000.

The navy yard north of the forty-second parallel of north latitude, on the coast of Oregon, is to be located in Puget Sound, opposite the thriving town of Seattle, where coal and lumber are abundant.

## Legal Decisions

### ATTACHMENT OF GOODS ON STORAGE FOR LIENS ON WAREHOUSE.

H., a sheriff, had placed in his hands a writ of attachment against the goods in the stores of the Garden City Warehouse Company, to secure to the attaching creditor the storage charges on the goods, the company having liens thereon. These storage rates were collected by H., but he paid them over to the debtor, on the ground that he could not make a lawful levy on them, as they were not subject to attachment. The creditor then sued the sheriff for the amount of the charges collected—*First National Bank of Chicago vs. Hanchett*—but was defeated, and an appeal was taken to the Supreme Court of Illinois, where the judgment was reversed. The Chief Justice, Sheldon, in the opinion said: "Conceding that the goods in the warehouse were not subject to attachment for the debts of the warehouse company, we are of the opinion that there was a dereliction of official duty on the part of the sheriff with respect to the storage collected. This money, so paid to him by the owners of the goods, was not his money; it was the money of the attachment debtor. It was paid to the sheriff on account of the debtor, and was received for his account. The officer was commanded by the statute to attach the money of the attachment debtor, and this money of the debtor we think he should have attached or have held the same as attached. If this money in the sheriff's hands was not strictly property of the warehouse company, which could not be seized in attachment, it might have been held and brought into court by the sheriff to answer to the judgment in attachment, as the court might direct. This certainly would be in the spirit of the attachment, with reference to the appropriation of credits on attachment, which directs that credits shall be attached, and this court has said that the attachment act shall be liberally construed. Had the sheriff held the money subject to the order of the court all would have been well, but he did not hold it. He did not obey the instructions of the attaching creditor, whose official agent he was, and he cannot justify his course by assuming the power of the court in determining to whom the money collected belonged. He is liable for the amount of the storage charges collected, and he must pay them over to the plaintiff."

### TRADE ASSOCIATIONS.

D. was a member of the New York Stock Exchange, and becoming insolvent he was suspended by its Governing Committee, who determined that his failure was caused by doing business in a reckless and unbusiness-like manner. It was resolved by the committee that D. was ineligible for readmission, and the exchange, pursuant to its constitution and by-laws, disposed of his membership and seat for \$25,000, and refused to pay it over to B., to whom D. had assigned the seat. The creditors of D. in the exchange claimed the proceeds of the seat under the rules of the exchange, and they were distributed among them. B. sued the president of the exchange for the proceeds of the seat, and the answer was set up that under the constitution and by-laws of the exchange the proceeds had been duly distributed among D.'s creditors in the exchange. B. in reply asked judgment in his favor on the ground that the answer was not a sufficient defense, but the court decided against him, and he carried the case—*Belton vs. Hatch*—to the Court of Appeals of New York, where he was again defeated. Judge Gray in the opinion said: "The judgment must stand. The New York

Stock Exchange is a voluntary association; it is not a partnership. It may be said, however, that the rights of the associates are not substantially different from those of partners so far as their rights in the property of the association are concerned. The interest of each member in the property of the association is equal, but it is subject to the constitution and by-laws, which are the basis on which is founded the association. They express the contract by which each member has consented to be bound, and which measures his duties, rights and privileges as such. It seems most clear to me that this constitution and by-laws derive a binding force from the fact that they are signed by all of the members, and that they are conclusive upon each of them in respect of the regulations of the mode of transaction of his business and of his right to continue to be a member. Whatever are the rights acquired by a member and created by his admission to membership, the rules by which the membership is created or dissolved and which control the officers of the organization, and the relations of the members entered into those rights when created and remained a part of them. There is nothing in this against public policy, for the reason that whatever the member acquires is subject to the self-imposed condition that his title and the rights which accrue from his membership are regulated by and are dependent upon the laws adopted by the association, and expressly consented to by him when he joined. If the constitution which forms the basis of this association appropriates to his creditors in the association or to any of its corporate objects the peculiar property of the member who, by force of constitutional provisions, has lost his membership, that was an incident entering into his title in it. D. must be held to his contract, and B. took no greater rights by the assignment."

### CONTRACT IN RESTRAINT OF TRADE.

N. sold sand, and he refused to sell a piece of land in which there was a deposit of sand on the ground that it would interfere with his business by enabling the purchaser to sell sand in competition with him. But at last he agreed to let the land go on the condition that it should be stipulated in the deed by a warranty that the grantee should "not sell any sand off the said premises." The deed was so made, but the person to whom this land was subsequently sold, claiming that this covenant did not run with the land, sold sand dug from the lot. N.'s executor then brought suit to restrain the last owner, S., from selling this sand, but he was defeated, and he carried the action—*Hodge vs. Sloan*—to the Court of Appeals of New York, where he had the judgment reversed. Judge Danforth, in the opinion, said: "The defendant insists that this covenant is in restraint of trade, and the court below has sustained this view. This conclusion is against our ideas of natural justice, for it takes from one party an advantage which he refused to sell, and secures to the other, without price, a privilege which his grantor was unable to buy. Nor do we think that this denial of private right is required by any rule of public policy. If we assume with defendant that the covenant is in restraint of trade, still it is valid if it imposes no restriction upon one party which is not beneficial to the other, and was induced by a consideration which made it reasonable for the parties to enter into it, or in other words, if it was a proper and useful contract or such as could not be disregarded without injury to a fair contractor."

The future lumber supply of the United States will, according to Gov. Russell Alger, be solved by the Nicaragua

Canal project. The Michigan and Wisconsin pine lands are being rapidly denuded, and but for the high freights by rail the Eastern market would even now be supplied from Washington Territory, where the forests abound in fir of a superior quality as Mr. Alger learns from personal observation. He says: "I think I am a fair judge of timber and I don't hesitate in pronouncing the product of these regions in every way superior to our Northern pine, and other countries recognize the fact. While I was in Tacoma I saw nine vessels, bound for England, Germany and China, loading at the wharves. I know that at the present time," he continued, "it cannot be profitably carried East by rail, because I have figured the matter with the roads touching that district, and it has been found impossible to carry the stuff 2000 miles at anything like a reasonable rate. If the canal is ever built, an enormous lumber traffic by water will surely spring up, and it will possibly come just at the time we need it most."

# CURRENT HARDWARE PRICES.

APRIL 29, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

# THE IRON AGE

THURSDAY, MAY 9, 1889

## New Mechanical Air-Valve Gear.

From the recently issued catalogue of the Rand Drill Company, of New York, we take the accompanying engravings and description of their new mechanical air-valve gear:

Many attempts have been made to provide a positive movement for air-

meet this condition automatic releasing gears have been applied, involving an amount of complexity which cannot commend itself to sound mechanical judgment. The following gear fulfills perfectly the varied requirements imposed by the discharge-valves, and instead of being an added complexity, it actually reduces the number of parts in a marked degree.

steam cylinders are entirely different. Under the dry heat of compressed air slide-valves are very apt to cut and score themselves and their seats, and so become leaky. This requires replaning or boring the seats, which is a machine job and involves expense and delay. Apart from the tendency to cut, such valves are unfavorably situated for tightness at best.

**Fig. 1.**

**Fig. 2.—Vertical Longitudinal Section.**

**NEW MECHANICAL AIR-VALVE GEAR.—RAND DRILL COMPANY.**

valves. The problem, as related to the suction-valves, is a simple one, but as related to the discharge-valves is difficult or solution, and on this account all such plans have been complex and objectionable. The difficulty of the problem arises from the fact that the discharge-valves should not open at a fixed point in the stroke, but at a point depending upon the pressure of the air carried, upon the altitude above sea-level, the barometric pressure and other factors beyond control. To

It retains the poppet-valve, which long experience has demonstrated to be peculiarly adapted to the requirements of air-compressors, for the reason that such valves have little tendency to wear leaky, and, moreover, any slight leak that may develop is easily repaired by hand-grinding at the first convenient shut-down. All experienced compressor-builders know that slide-valves (whether flat or rotating) are not adapted to use under heavy air pressure. The requirements of air and

The flat head of a cylinder, seriously weakened by the cutting of long ports across it, is certain to spring under the alternate application and release of heavy pressure, and with valves extending clear across these springing heads, tightness is impossible. This is a matter of great importance, as tight air-valves are a necessity if good results are to be reached. The discharge-valves may leak seriously, allowing a large percentage of the air to pass back into the cylinder and the loss

be unsuspected. Even the indicator gives no certain indication of this leak, which is the explanation of the fact that compressors with slide-valves do not give the volume of air which is due to their cylinder capacity. As is well known, valves of the ordinary poppet form chatter more or less, and to reduce this as much as possible it is usual to give them a small lift, making up the required area of passage-way by putting in additional valves. If any one valve could be allowed to open widely and freely it would provide greatly increased passage-way, and this would dispense with the necessity for so many valves. This device stops the chattering, and hence allows us to give the valves a full lift and get the full passage-way due to their area, thus making one valve the equivalent of seven or eight of the usual kind.

Fig. 1 illustrates the appearance of an air cylinder with the new movement applied, and Fig. 2 shows the method of its working. The principle of this gear is as simple as its construction. The usual form of valve chatters because the air tries to pull it open while the spring tries to pull it shut, and first one and then the other prevails. This device simply releases the valve from the pressure of the spring while the valve is open. The spring is used to close the valve, and is made strong enough to do this positively, but before the valve opens and while it remains open it is entirely released from the pressure of the spring, and hence it goes wide open and stays there. In Fig. 2 A is a sliding bar, driven by the main steam-valve stem in the class A and B compressors, by the Corliss wrist-plate in the Corliss engine compressors, and by an eccentric in water-power compressors. Arms *a*, *b*, *a'*, *b'* are keyed to the bar. In the position shown, arm *a* has engaged the washer *i* and moved it to the left, away from the nuts *j*, thus releasing valve *g* from the pressure of the spring *c*. Similarly arm *b'*, through rod *e'* and tube *f'*, has released valve *h'* from the pressure of its spring. The two valves are thus at liberty to open wide and stay there. At the proper moment the springs are relaxed, and as the crank passes the center the valves close. The most peculiar and remarkable feature of the device is that it fulfills perfectly the varied requirements of the discharge-valves without any additional mechanism whatever. The movement of the bar A is so timed that the discharge-valve spring is lifted before the valve is ever wanted to open, the pressure of the air upon the valve (aggregating from 500 to 1000 pounds) being ample to hold the valve to its seat. The spring being relaxed, whenever the pressure in the cylinder equals the pressure in the receiver, no matter what that may be, the valve is ready to open and does open widely and freely. The movement of bar A is so timed that the compression of the inlet spring occurs some time before the piston reaches the end of its stroke, consequently when the piston commences its return stroke, the spring being already compressed, the valve is at liberty to go wide open at once, instead of waiting for the slow movement due to an eccentric, as is the case with the absolutely positive movements. As will be seen, the inlet valve is provided with a guard, and, to lessen the clearance which exists between the valve and guard of the usual form, the valve is here made hat-shaped, as will be understood from the illustration. The clearance due to this form of valve is two-tenths of 1 per cent., which is much less than with the usual form of valve with guard, and is believed to be lower than with any form of valve that has been proposed. We also provide the discharge-valve stems with a safeguard to prevent their getting into the cylinder in case of breakage. This is not shown in the cut, owing to the small scale.

## The Illinois Steel Company.

### The Consolidation Effected.

The consolidation of the North Chicago Rolling Mill Company and the Joliet Steel Company, under the name of the Illinois Steel Company, was successfully accomplished last week. The programme laid down in our issue of the 21st of March was carried out in every respect. The stockholders of the three companies met on the 1st inst. and voted in favor of consolidating. Meetings were held on the days following to arrange the details, and finally on the 4th inst. everything essential had been consummated and the organization of the Illinois Steel Company was announced, with the following list of officers:

O. W. Potter, chairman of the Board of Directors and chairman of the Executive Committee; A. J. Leith, president, with his office in New York; W. R. Stirling, first vice-president; E. C. Potter, second vice-president; R. C. Hannah, secretary and treasurer; Y. B. Haagsma, general auditor. The Executive Committee, who are the governing power of the corporation, are composed of O. W. Potter, J. C. Morse, A. J. Leith, W. R. Stirling and E. C. Potter. The Board of Directors consists of O. W. Potter, Nathaniel Thayer, Francis Bartlett, William J. Rotch, H. H. Porter, J. C. Morse, Marshall Field, A. J. Leith, John Crerar, W. R. Stirling and E. C. Potter. H. A. Gray is agent of the Chicago, South Chicago and Union Works. John C. Stirling is agent of the Joliet Works. John C. Parkes is manager of the Chicago and South Chicago Works. Robert Forsyth is manager of the Union Works. H. S. Smith is manager of Joliet Works. Francis Hinton is manager of the Milwaukee Works. Julian L. Yale is general sales and purchasing agent.

The works now in operation are the South Chicago, Milwaukee and Joliet, the latter having been started again on the 1st inst. The North Chicago and Union will not be operated at present. The first of these to be started will be the Union, and hopes are entertained that the rail trade will be brisk enough to take its product in at furthest two months. The Union blast-furnaces are being overhauled, remodeled and thoroughly modernized during this period of idleness. As speedily as possible the policy of the company with regard to undertaking the manufacture of a complete line of structural shapes and other products will be considered and settled by the Board of Directors.

The Illinois Steel Company are capitalized at \$25,000,000. The total annual capacity of their five works as at present constituted is as follows, according to Vice-President E. C. Potter: Pig-iron, 850,000 tons; steel rails, 900,000 tons; structural shapes, 50,000 tons; wire-rods, 50,000 tons; merchant-bars, 60,000 tons; railway splices, 40,000 tons; nails, 15,000 tons. The grand total of these products is 1,965,000 tons. Steel billets are largely made for the open market, but as they are rolled on the rail trains their tonnage is necessarily included in that of steel rails. With respect to tonnage of product the Illinois Steel Company is now the largest steel company in the world. The number of men employed averages about 10,000, but the force will be increased as the demand for iron and steel improves and as additional departments now contemplated are constructed.

The consolidation of these three companies is one of the most remarkable events in our industrial history. Each company was conducting a successful business, each was managed by men of more than ordinary shrewdness in conducting

manufacturing operations on a large scale, and each had reason to look forward to years of prosperity as solidly-established enterprises. But their managers concluded that it would be possible to conduct them even more satisfactorily to their stockholders if united in one concern, and they proceeded to do so. It remains to be seen whether any manufacturing establishments in other parts of the country will follow their example, or whether the founders of the Illinois Steel Company will have accomplished an achievement unique in its character and impossible of imitation.

### Adjustable Clamping-Block.

In our issue of August 23, 1888, we described an adjustable clamping-block made by the Energy Mfg. Company, of Philadelphia. Since then several important changes have been made in the block, as shown by the annexed cut. This block is used for filling under clamps and work when clamping to various machine tools. The top of the block is fitted with a set screw, so that it can be used as an adjustable screw-block when blocking up work, and

Adjustable Clamping Block.

in a number of other ways will be found handy about the shop. The base of the block is taped so that if it is necessary it can be fastened to the machine on which it is used, as on the face-plate of a lathe when used as a block or driver for pulleys, &c. They are made in five sizes, filling under from 2½ inches to 21 inches.

### Cost of Storage-Battery Power.—

The following figures are given out by the Julien Electric Traction Company as actual results attained on the Fourth avenue surface road, New York City, in running cars with storage batteries. A car can run in actual work 57½ miles without recharging. During 40 days that the car in question has been at work neither batteries nor motors have required attention or expense for repair or renewals. The batteries of one car that had been running since September 3, 1888, were examined on the 8th ult. for the first time, and are stated to be in as good condition as when put in. The cost of motive-power is calculated at \$3.10 per car per day of 60 miles. This is the cost of energy at 2 cents per horse-power, at which it is offered to be supplied by the electric companies, and \$700 per annum for maintenance of batteries and motor.

The Governor of Pennsylvania has signed a bill making September 30, Labor Day, a holiday.

**Steel as an Engineering Material.**

While the growing use of steel as an engineering material testifies unmistakably to its superior stability for general purposes, yet the *Engineer* holds that there are situations where it appears to be rejected in favor of iron, and these instances seem lately to have been on the increase in England. The greater liability of steel to corrosion is in many cases the cause of this preference for the older metal, especially in boilers where the feed-water is bad. Much has been said anent Thames mud, but it is doubtful whether it is worse than

meeting just held of the South Staffordshire Institute of Iron and Steel Works Managers. A paper was read by Mr. G. H. Walkeden, entitled "Notes on the Lancashire Boiler," and in the course of discussion this topic of electrolytic action was touched on by Mr. A. E. Tucker, metallurgical chemist, of Smethwick. He knew, he said, of cases in that district in which boiler explosions had been clearly attributed to electrolytic action set up by the combination of iron and steel in the construction of the boiler, and by the presence of brass fittings. This action had sometimes been set up by the use of

**Ashland Blowing Engine.**

The engine of which we herewith present drawings was built by E. P. Allis & Co., of Milwaukee, Wis., for the Hinkle Furnace of the Ashland Iron and Steel Company, of Ashland, Wis. It is one of the finest of its class, and is designated as a "vertical direct-acting type," having steam-cylinder below and air-cylinder above. The steam-cylinder is 34 inches in diameter by 4 feet stroke, and is fitted with a Reynolds Corliss valve gear. The air-cylinder is 78 inches in diameter by 4 feet stroke, and has the Reynolds patent positive-motion air-valve. The two fly-wheels weigh 31 tons, and the total weight of the machine is 92 tons. The speed of the engine is controlled by a fly-ball governor attached to the cut-off cams of the steam-valve, and the speed can be varied from 12 to 50 revolutions by simply turning a hand-wheel, the engine remaining absolutely under control of the governor.

The special feature of the machine is the valve gear of the air-cylinder, which was invented and patented by Edwin Reynolds, superintendent of the Reliance Works of E. P. Allis & Co. In each cylinder head are two rolling valves, each 16 inches in diameter, one being the inlet and the other the discharge. The inlet-valves, shown to the left in Fig. 2, are opened and closed positively by means of a direct connection with a wrist-plate. The discharge-valves shown at the right in the same drawing are closed at the proper time by the same wrist-plate that drives the inlet-valves, but are opened automatically when the air in the cylinder reaches the same pressure as the air in the blast-pipe leading to the furnace. In other words, while the inlet-valve is opened unvaryingly by means of its connection with the wrist-plate, the delivery-valve is so constructed and arranged as to open automatically and instantaneously to its full capacity when the pressure in the air-cylinder is nearly or quite equal to that in the receiver. The construction by which this is accomplished is exceedingly simple, reliable in its action and capable of adjustment to meet desired requirements. The wrist-plate is driven by an eccentric on the main shaft of the machine through suitable connection. The connection between the wrist-plate and the delivery-valve is by means of a rod slotted to receive a pin on the actuating arm of the valve, and is positive in its motion only at such time as the rod is moving toward the cylinder head and acting upon the valve to close it. When the motion of the wrist-plate is reversed the slotted end of the rod permits the reverse motion of the wrist-plate and rod to take place, while the delivery-valve remains closed, being held in that position by a hook or catch until it is automatically released and allowed to open. Attached to the stem of the valve is an arm, provided at its outer end with a pin and block, on which is also attached by pin and rod a weight working in a dash-pot. To a fixed pin is pivoted a hook provided with a tail-piece engaging with the block. The piston-rod of the piston of a small supplemental cylinder is so arranged as to disengage the hook at the proper time to allow the weight to open the delivery-valve. When this valve is closed the piston-rod is free of the hook, and yet so near that a short movement will cause it to bear against and release the hook. The small cylinder is connected by pipe in its top with the receiver or blast-pipe leading to the furnace, while a second pipe connects the other end with the end of the main cylinder, so that on one side of the piston there is always the pressure of the air in the receiver, while on the other side there is whatever pressure there may be in the main air-cylinder.

Fig. 1.—Side Elevation.

**THE ASHLAND BLOWING ENGINE.**

the ingredients of Staffordshire canal water; anyhow, the latter element is a serious nuisance to the steam user. This perhaps is why one sometimes hears of such cases as a Staffordshire steam user paying as much as \$2000 for a boiler 30 feet long by 8 feet, and insisting, as one of his chief conditions, that it should not be made of steel. In many cases, however, steel is doubtless condemned unnecessarily. An iron-master put steel in the bottom of his boilers, and had to have them rebottomed before it had worn three months. He put in iron, and the iron continued very much longer. In a case like that there must, one would think, have been some serious defect somewhere. More often than steam users think, failures in boiler working arise from electrolytic action where various metals are in conjunction. A notable instance of this kind was mentioned at a

tie rods of manganese bronze and phosphor bronze and similar materials. The intention had been to prevent corrosion, but the effect was just the reverse, for the electrolytic action had been very marked at both ends of the tie rods, and the steel plates had been correspondingly corroded at those particular points. Doubtless many instances of the kind adduced by Mr. Tucker could be recorded where the blame rests neither with bad feed-water nor with the quality of steel, but with unsuitable combinations of metals.

Mills for the manufacture of cotton in the Southern States are multiplying rapidly. Within a short time 15 companies have been organized, three of them in Alabama. In several instances capitalists from Philadelphia and New England are concerned.

The action of the mechanism is as follows: As the wrist-plate and rod operating the delivery-valve move toward the head the delivery-valve is closed positively, and as the extreme limit of motion of the wrist-plate is reached the hook is thrown forward, engages with the block and holds the valve closed. As the motion of the wrist-plate and rod is reversed the forked end of the rod slides back upon and independently of the pin on the valve-stem arm, and consequently allows the delivery-valve to remain closed until such time as the pressure in the air-cylinder, and consequent pressure on the under side of the supplemental piston connected with the air-cylinder by a pipe, is sufficient to overcome the pressure on the opposite side of the piston connected with the receiver, when the piston will move forward and its rod will strike against the hook and thereby disengage it from its block. When this takes place the weight instantly opens the delivery-valve to its full extent, and it remains open until again closed by the action of the wrist-plate and its rod on the reverse stroke. It is evident that, if deemed desirable, the receiver pressure on the upper surface of the piston in the supplemental cylinder can be counterbalanced so that the piston will move forward to trip the hook and allow the valve to open before the pressure in the main air-cylinder equals that in the receiver. The complete action of the valves on one end of the air-cylinder may be briefly described as follows: At the beginning of the stroke the delivery-valve is closed and the inlet-valve begins to open, opens very quickly, and remains open until the piston reaches the opposite end of its stroke. Just as the piston begins its return stroke the inlet-valve is closed and is retained against its seat by the receiver-pressure on its back. As the piston moves back the air before it is compressed until it equals the pressure in the receiver, when the piston in the small cylinder moves forward, disengages the hook and permits the opening of the delivery-valve instantly to its full extent. At the time of its opening the delivery-valve is in equilibrium, so that the amount of power required to move it is very small.

The construction of the steam-cylinder valve gear will be understood from the drawing Fig. 3. At 50 revolutions this engine has a capacity of 13,000 cubic feet of air per minute. It is believed that this machine has all the points desirable in a blowing engine—namely, maximum quantity of air with a minimum consumption of steam and a great range of speed with a high economy at any number of revolutions.

**The Duty on Crop Ends.**—In accordance with the recent action of the United States Court for the Southern District of New York in directing a verdict for the plaintiff in the case of *Dana vs. Magone*, the Treasury Department has directed the collector at New York hereafter to assess the duty on steel crop ends, consisting of imported steel rails or ends cut from steel rails in the process of manufacture, and of ends cut from steel blooms, at 45 per cent. ad valorem, instead of at 7½ cent per pound, as has been the practice heretofore.

For many years in war ships no other than the horizontal engine for screw vessels was used, on account of the necessity for the most complete protection involved, and on this account the efficiency of the machinery arrangement was considerably reduced. Within a comparatively few years, however, ingenuity and skill have triumphed over this difficulty, it having been found possible to sufficiently protect the cylinders of vertical engines from danger by projectiles, and this type of en-

gine has in all such cases invariably been thus fitted. The advantages gained by the use of the vertical engine instead of the horizontal are very considerable, the engine working far more smoothly, wearing more evenly, and all parts being much more accessible for inspection.

#### Economics of Coke Manufacture.

Reference has already been made in these columns to the new method of coking introduced by the National Coke and

development of other industrial improvements, difficulties and obstacles were met with that it needed much patience in experimenting to overcome.

The practicability of the process depends simply on the facts that volatile matters are now burned up in coke-making very much in excess of what can be usefully applied in the manufacture of furnace coke, and that increased economy of heat can be effected by covering the charging-hole or top-eye of the coke oven and leading off the waste products of combustion

Fig. 2.—Air-Cylinder Valve Gear.

#### THE ASHLAND BLOWING ENGINE.

Fuel Company, of Chicago; and it is now proposed to give some further details of the results that have been obtained. Mr. R. H. Lewis, the general manager of the Calumet Iron and Steel Works, where these experiments have been tried, says they got from every ton of coal coked 15,000 cubic feet of fuel gas, equal in quality to that from Siemens producers; 3 to 5 gallons of coal oil, which sells in the crude state for creosoting purposes at 10 cents per gallon, and liquors containing ammonia equivalent to about 3 pounds of sulphate. The process used has been known abroad for some years, under Mr. J. Jameson's patents several plants in the North of England having been continuously operated for several years with varying success. In this, however, as in the

by a flue placed about 10 inches above the surface level of the charge of coal and at the back of the oven, or in other words directly opposite the door. Another advantage of this arrangement of flues is that these hot waste gases being conveyed through a large main flue-way running the whole length of the bunch of ovens, considerable of the residual waste heat can be usefully applied in the production of steam or otherwise, and the gases then led, at a temperature of about 400° F., into a tall chimney, by means of which an almost unvarying draft is maintained and the operation of coking thus rendered much more uniform. All admit that in the manufacture of blast-furnace coke there may be no recovery of by-products that involves deterioration in the quality of the

main product. It is for this reason, among others, that none of the many such processes of coke-making in retorts or close ovens has come into general use. The National Coke and Fuel Company's recovery process is, so far as known, the only one permitting of that most essential condition for the production of furnace coke, an intensely high temperature in the interior of the oven.

tillation from its under and inner surface. Clearly in the production of say 15,000 cubic feet of gas per ton of coal coked the average rate of withdrawal from each oven will be only about 84 cubic feet per minute. It is this, together with the fact that exhaustion equal to about 8 inches head of water must be maintained in the passages immediately beneath the oven floor, which gave rise at several places

18 months, and now the patents on all construction improvements as well as those covering the principle or groundwork of the process have been secured by this company, in which several well-known Chicago men are largely interested. Experiments have been instituted directed to the separate collection of the richest portions of the fuel gas and to their further enrichment by the aid of recovered oil or less valuable crude petroleum and the application of heat now wasted at the ovens. The company are advised by an eminent gas engineer that this gas thus enriched could be easily fitted for illuminating purposes. What may be their immediate intention in regard to the application of this process we do not know; but nothing can be more clear and satisfactory than the great benefits which will ultimately accrue to the country from the universal application of such economic improvements.

Fig. 3.—Steam-Cylinder Valve Gear.

#### THE ASHLAND BLOWING ENGINE.

This method consists in the withdrawal through a hollow floor, by gentle exhaustion, of a certain proportion of the volatile matters distilled from the coal in an ordinary beehive oven, advantage being taken of the fact that soon after an oven load of coal is lighted on top in the ordinary way a pasty seal of melted and decomposing coal is pressed around the sides and on the upper surface of the charge. This "seal" in the progress of the burning advances inward toward the center and downward toward the bottom of the charge or to the surface of the oven floor. Its existence permits of the continued exhaustion of the first products of dis-

to partial failures and to disappointing results with this process. It had to be discovered by tedious and costly experiments made near Durham, England, that the access of very little air to the hot gases beneath the oven floor was fatal to good results; that the means which were in the first relied on to prevent such access yielded after a time to the deteriorating influence of sudden and violent changes of temperature, and that special methods had to be devised and proved for securing not temporary, but permanent, immunity from leakage.

The tests made by the National Coke and Fuel Company have extended over

#### Damages for Insufficient Car Service.

At Pittsburgh last week Riddle, Dean & Co. brought suit in the United States Court, under the Interstate Commerce act, against the New York, Lake Erie and Western Railway Company. The plaintiffs are agents for the sale of coal on commission for mines near Pittsburgh. In November, 1887, they claim they received orders from Cincinnati for coal, and placed the order with mines on the Pittsburgh, Chartiers and Youghioghenny Railroad, a branch of the Pittsburgh and Lake Erie. The latter road connects with the New York, Pennsylvania and Ohio, which is operated by the defendant company, at Youngstown. On September 26, 1887, a coal tariff was issued from the mines of the Pittsburgh, Chartiers and Youghioghenny and Pittsburgh, McKeesport and Youghioghenny railroads to points on the New York, Pennsylvania and Ohio, including Cincinnati, at \$1.10 per ton. Acting under the tariff the plaintiffs gave an order to the railroad company for five cars per day. At the same time the Lake Shore mines, on the Pittsburgh, McKeesport and Youghioghenny Railroad, gave an order for from five to ten cars per day with which to supply an order from Cincinnati. A few days later the railroad company issued an order to stop all cars *en route* and to load no more with coal for Cincinnati. On January 3, 1888, the company withdrew the rates to Cincinnati on coal and refused cars for there. The order of the Lake Shore mines, however, was filled. The plaintiffs claim damages by reason of the treatment they received from the New York, Lake Erie and Western Railway Company to the extent of \$10,290, the amount of loss on that contract. The case was before the Interstate Commerce Commission, but was decided against the plaintiffs, who have now brought it before the United States Court.

Congressman Springer, the chairman of the House Committee on Territories, is elated about Oklahoma. He says it is a greater event than the California gold discovery, and that in ten years Oklahoma will be as popular as Kansas. He believes it will settle the Indian question. The land not required for the Indian will be occupied by white men, and they will become his co-workers in the production of wealth and the development of the resources of the country. Mr. Springer said he hoped that within a few weeks or months the Cherokee outlet, containing over 6,000,000 acres, would also be opened for settlement, while that part of the Seminole and Creek purchase west of the 98th meridian and north of the Canadian River, containing about 3,000,000 acres, would also be opened at an early day. He believed that Congress would at once pass a territorial bill for Oklahoma.

### The Newport News Dry-Dock.

The formal opening of the great dry-dock at Newport News a few days ago is regarded as the initial step in a comprehensive scheme for building iron steamships on Southern soil. This dock is the largest in the country, the length on top being 600 feet. At the Portsmouth Navy Yard there is a Government dock 500 feet long, while the one that is being built at the Brooklyn Navy Yard is about the same length as the one at Portsmouth. The Chesapeake Dry Dock and Construction Company, who have constructed the immense dock, expect, on account of its vast dimensions, to secure the docking trade of all the ocean steamship lines. The cost of the dock is \$525,000.

The dimensions are as follows: Six hundred and thirty feet long from head to outer sill, 130 feet wide at top and 50 feet at the bottom, and 33 feet deep, with a slope in the bottom of 24 inches to the 560 feet. The approach to the dock is piling, 250 feet long and 150 feet wide, while on each side piers 80 feet wide afford ample wharf room. The caisson is an iron structure 96 feet long on top, 50 feet at bottom and 33 feet deep. The dock is supplied with two centrifugal pumps of a capacity of 40,000 gallons per minute, each of which empties it in 1 hour and 36 minutes. The combined power of the two engines is 500 horsepower. At high tide the dock contains 8,500,000 gallons of water, and at a recent trial with two pumps was emptied in 1 hour and 37 minutes, which is equal to each pump throwing about 44,000 gallons of water a minute. Besides docking and repairing ships, the company are preparing to build iron hulls of the largest dimensions, and to that end have already placed alongside the dry-dock an extensive plant of machinery, to which additions will be made from time to time as the magnitude of the work increases.

Sinking shafts in soft earth or quicksands is a difficulty which has been overcome by the Poetsch Sooyamith Freezing Company, and an operation of this kind in the collieries at Wyoming, Pa., is watched with special interest. Two shafts are to be put down by different methods—one by the pneumatic system and the other by freezing. The earth through which the shaft is to be sunk is of a soft nature, and much of it has to be driven through a bed of quicksand. In the new system of freezing iron pipes are driven into the earth to be excavated, and through these a cold solution is circulated, causing the sand and dirt to freeze solidly. It can then be dug by the workmen without any attendant danger, and is forced by means of compressed air to the surface. The size of the shaft is 25 x 25 feet, and it will be sunk in this manner 105 feet before rock is reached.

A little English road, the Lynton and Lynmouth, which is expected to be opened early in July, will probably have the steepest gradients of any in the world, the inclination being 1 in 14 throughout its short length of 300 yards. Starting from the esplanade at Lynmouth, the carriages will ascend a vertical height of nearly 500 feet in one minute. The motive-power will be water, conveyed in a line of pipes nearly 1 mile from the West Lynn River. The carriages will run on steel rails, and there will always be an ascending and descending carriage, the two being connected by two steel wire ropes, so that when both carriages are empty, or when both are equally loaded, one balances the other. When the ascending load is heavier than the descending one the difference will be made up with water, let into the tank be-

neath the descending carriage. The carriages are fitted with eight brake blocks, which may be instantly and automatically applied to grip the rails, which latter are bolted to the slate rock through which the cutting is made. This method of counterbalancing the weight of the ascending carriage by means of water admitted to the descending carriage was, if we remember rightly, first employed by Fulton. Plans have also been prepared for a similarly operated road in the Catskills.

### The Roberts Tuyere Stock.

The main difficulty that has been experienced with existing tuyere stocks in which one section is movable has been the great weight of the movable part and consequent inconvenience in handling. Frank C. Roberts, Philadelphia, has designed a tuyere stock with a view to avoid

access to the tuyere opening, a rope is passed through lugs N and O, the blow-pipe released as before and the key P removed. This permits the movable section C of the stock to revolve on the center R to the position shown by the dotted lines. Of course, no claim to originality is made by Mr. Roberts for the ball joints and side suspension bars, these being used in other designs for tuyere stocks.

### Sodium Manufacture in England.

The Alkaline Reduction Syndicate, Limited, says the *Chemical Trades' Journal*, have leased ten acres of land belonging to Charles Tennant & Partners, chemical manufacturers at Hebburn, and adjoining the Tharsis Copper Works at the same place, for the purpose of producing metallic sodium by a process patented by Captain Cunningham. The alkaline syndicate also propose treating certain refractory

THE ROBERTS TUYERE STOCK.

this difficulty, the object being accomplished by making the movable section short in length and, as a result, light in weight. The full lines in the accompanying illustration show the stock when connected to the furnace, while the dotted lines show the position of the movable section when disconnected to allow free access to the tuyere opening. The stock proper is divided into two parts, A, B, the lower section, B, being suspended from A by side bars, C. Ball joints are provided at D and E. The seating of these joints is adjusted by means of keys, F G. The blow-pipe X is brought to its seat in the tuyere by means of the bail H and set-screw I; the operation of the latter causing the movable section B of the stock to turn on the center J of the ball joint D. The length of the blow-pipe is adjusted in the ordinary manner by means of the screw thread K working in the socket L.

When it becomes necessary to replace a tuyere, the blow-pipe is disconnected by knocking out keys G, loosening keys F, raising the adjusting bail H to the seat M and turning the movable section B on the center J. The tuyere may then be taken out. When it is desirable to obtain free

metalliferous ores, and have already commenced the construction of their works, which will be on a moderate scale at first, but which the firm expect will ultimately attain very considerable dimensions. Captain Cunningham and his son are to be the chief engineers. The metallic sodium produced by the syndicate at Hebburn is to be sent to Wallsend, where it will be used by the Alliance Aluminium Company—who have made arrangements for erecting large works there—in the manufacture of the metal aluminium on a very large scale. The object of the Alkaline Reduction Syndicate at Hebburn and the Alliance Company at Wallsend is to produce aluminium by the new and extremely cheap process. In the production of sodium the syndicate have so far conducted their work in an experimental manner, and the experiments are now to be put to a practical test by erecting works on a manufacturing scale. If the test is successful, then large works will be built at Hebburn for the production of sodium to be supplied to the aluminium company at Wallsend. The Hebburn syndicate and the Wallsend company are separate and distinct firms, but each is composed of well-known and influential capitalists.

### The Wells Light.

Although this lamp was only put on the market last season, it has been widely adopted in England, and is now being introduced into this country by Wallwork & Wells, whose temporary address is *The Iron Age*. There are over 200 in use on the Manchester Ship Canal, and the contractor states that if it had not been for this portable light night work could not have been carried on as effectually as it has been. It is especially adapted for lighting railway work, bridge buildings, coal wharves, docks, foundries, &c. We illustrate two of the several forms made—the portable, and that arranged either for heating or lighting.

The tank is made of the best steel boiler plate and will stand rough usage. By means of a small hand-pump screwed into the top, and which can be quickly taken out for the renewal of leathers, &c., oil is

ers with oil led through suitable pipes. The necessary pressure is obtained by connecting the tank with the town's water-supply. The water can be regulated to any pressure by a reducer, and the only expense for driving is 1 gallon of water to 1 gallon of oil. When the water has pushed all the oil out of the tank, as shown by the glass gauge, the water is drawn off and the tank again filled with oil. The lamp burns a cheap creosote oil, obtained in the distillation of coal tar, and which costs in England 2d or 3d per gallon.

### Maintenance of Steamship Lines.

One of our commercial contemporaries has a plausible argument favoring special measures by Congress, or at least the Post-office Department, for the permanent establishment of steamship communication, under the American flag, between

purpose of building up the merchant marine, as may be gathered from the letter of a member of Parliament recently published in the *London Times*, in which he says, in replying to a criticism that England was losing £1000 a day by its ocean mail service: "As a matter of fact these subsidies are not paid to make up a deficiency in the postal accounts, but in order to keep up the character of our merchant fleet." The debates in Parliament and official reports are crowded with similar testimony. According to the report of the British Postmaster-General for the year 1885, the total amount paid that year for subsidies with ocean steamship lines amounted to £774,626, equal to \$3,870,000, but by reference to the detailed statement of the specific sums of which this total is made up it will be found that only about one-half is paid to lines running to British colonies, and that the other half is for steamers

Fig. 1.—Portable.

Fig. 2.—For Heating or Lighting.

### THE WELLS LIGHT.

pumped into the tank from a bucket or cask until the air already in the tank is compressed to about 25 pounds pressure. The burner is then heated by burning a little oily waste in the cup. The valve being opened, the oil is forced up by the air pressure into the heated burner, and being converted into gas, issues from the jet and burns as a large brilliant flame. The heat of this flame passing through the generating tubes continuously turns the fresh ascending oil into gas. The lamp is continuous in operation, as the oil can be pumped into the tank while the light is burning. When charged with air, at 25 pounds pressure, the lamp will burn for four or five hours, or until the pressure is reduced to 8 pounds, without regulating the oil-tap feed. The falling pressure does not diminish the power of the flame. The great difference between this lamp and those of the Lucigen class is that it requires no outside connections or continuous motive power, such as air or steam; and as the oil is driven out and burned as a gas, and not as a spray, there is no loss of oil when the flame is deflected by wind. When the light is used in a foundry or large works, one tank supplies all the burn-

ports in the United States and important foreign markets. It says:

It is useless to attempt to disguise the fact that the British Government not only pays liberal mail subsidies, but the amount is usually fixed far in excess of any reasonable compensation for the mere transportation of a few bags of mail matter from one port to another, and this is done with the avowed object not only of transporting the mail, but of affording such compensation as will insure the maintaining of the service against any foreign competitor. It is by this means that a trade is built up that in time renders the enterprise so far independent of Government aid that a reduction of the subsidy can be submitted to without crippling the service or impairing the profits which the shareholders have previously received and part of which has been drawn direct from the public purse. The fact is that, as an illustration of success, the policy of the British Government in this respect is unanswerable, and until we follow it our mercantile marine will remain in the same humiliating position that it now occupies. Further than this, the English themselves openly admit that these subsidies are for the

trading with foreign countries. When Louis Napoleon sought to establish a line of steamers trading with India and China, he first of all granted the *Messageries Impériales*, as it was then known, a subsidy that enabled it to compete successfully with the Peninsular and Oriental Company, that up to that time had enjoyed a monopoly of the Eastern traffic and established the large and prosperous business that is now carried on by the *Messageries Maritimes*. At one time the English Government paid the Peninsular and Oriental over £400,000 per annum in order to sustain it against the competition that it had to face. These heavy subsidies not only developed a trade that since then has supported several lines of steamers, but in return brought thousands of pounds in trade to British ports.

It is stated that there is 20 per cent. less surplus of iron ore at Lake Erie ports this year than last. It is learned that on May 1, 1889, there were 558,753 gross tons on dock, while on May 1, 1888, there were 703,720 tons. The winter shipments were 1,289,802 tons, or over 50 per cent. greater than during the winter of 1887-88.

## The Paris Exposition.

(From a Special Correspondent.)

The eleven years since 1878 have not been lost on the French people, and the exhibition about to be opened will show wonderful progress in all branches of engineering and mechanical works. While retaining the finish and perfection of detail for which they have always been noted, their ambition and their daring, which have been quite as prominent characteristics, have been turned into industrial channels. Having renounced, at least for the present, the hope of military renown, they are striving to win distinction in the peaceful rivalry of industrial progress. There is a good deal of political feeling, too, underlying their interest in this exposition. They desire to show the progress their country is making as a republic, and that under such a government a Frenchman can have quite as much to gratify his national pride as under an empire or a monarchy. They are, therefore, determined to eclipse all previous exhibitions. The Eiffel Tower is nearly twice as high as any other structure in the world. Their machinery hall is the largest room in the world without a pillar. Their buildings are all not merely houses to contain the exhibits, but beautiful architectural works, ornamented in the most lavish manner with mosaics, statuary, stained glass, paintings and decorations of every kind. The regulation of the exhibits, too, is carried further than at any previous exhibition, giving much better classification and an appearance of uniformity and symmetry that adds immensely to the general effect. This is, of course, only true in part of the foreign sections.

### THE MACHINERY DEPARTMENT.

In the machinery department things are in a more backward condition than in the industrial section, and it is probable that many exhibits will be incomplete on the day of opening. The blame for this must be borne in part by the management of the exhibition, which was very backward in its work on the building, and partly by exhibitors and their agents. Some important exhibits stand to-day with their boxes unopened, neither exhibitor nor agent having put in an appearance. An order has been issued by the French authorities that all boxes must be removed, and the officers are to-day engaged in doing this when the exhibitors or their agents are not here.

The two lines of shafting running through the American machinery section are driven by two distinct types of engine standing opposite one another, so that the contrast between them is sharply brought out. One is the Straight-Line engine from Syracuse, N. Y., the other built by C. H. Brown & Co., Fitchburg, Mass. They are as different as possible in size and appearance, though both of equal power. They are distinctively American in type. The Brown engine is connected with the shaft by a 20-inch belt, made by the American Leather Link Belt Company, designed to transmit 100 horse-power. This was the first main driving belt in position in Machinery Hall, and attracts much attention. Edison's electrical exhibit is the most prominent and occupies by far the largest space of any in the American section. Among the subjects shown the most prominent are electric lighting, ore separating, electric subways and the phonograph and graphophone. The Thomson-Houston International Company and the Heisler Electric Light Company have also considerable exhibits.

J. A. Fay & Co. have a large and well-arranged exhibit of 27 of their wood-working machines, to be driven by a special engine, with which they are connected by underground shafting. All of the machinery is to be shown doing work. Near them

is an exhibit of the Otis gas engine. The Ingersoll Rock Drill Company will show an air-compressor and other machinery. An important exhibit will be made by the Stiles & Parker Press Company. The American Screw Company will show their new machinery for rolling screws, and it is understood that they will make screws. The Simonds rolling machine will also be in operation. Brown & Sharpe Mfg. Company have a fine line of their machine tools.

In the allotment of space in Machinery Hall the United States has fared better than Great Britain, but in the parts of the exposition devoted to diverse products, called

### THE INDUSTRIAL SECTIONS.

England and her colonies were more generously treated than America. But the United States cannot complain. When William C. Gunnell, Chief of Installation, finished his work at the New York office of the commission and came to Paris to superintend the placing of exhibits, he found that the applications for space from American manufacturers, had they been granted, would have required more than three times the area of floor and wall space allotted to America, and that the work of cutting down and weeding out necessary to get the largest number of firms and best variety of goods in the limited space greatly improves the character and appearance of the United States section. When manufacturers learned how scarce space was and how fortunate they were in getting any reasonable amount, they took more pains and spent more money to fill that space creditably.

The industrial section, which is in the east wing of the main building, and which has for its neighbors Spain, Portugal, Greece, Italy and Sweden, is just now the scene of prodigious work. The chief of the section and a corps of French laborers work late every night, and many of the exhibitors and agents do the same, filling the show-cases and preparing for May 6, the opening day, when the President of the Republic will visit this section. Captain Cochrane and a detachment of marines from Brooklyn Navy Yard arrived a few days ago, and are quartered at the French military school near the exposition grounds. The marines do guard duty day and night in the American section.

The principal exhibits now in place are those of L. & I. J. White, of Buffalo, N. Y., whose case of edge-tools is surmounted with a buffalo's head; A. G. Peck & Co., of Cohoes, N. Y., who have a tall, pyramid-shaped case covered with bright axes, hatchets and picks; J. R. Torrey Razor Company, of Worcester, Mass., who display samples of razor-strops in a large show-case; the American Bit Brace Company, of Buffalo, who have two cases filled with bit, speed and corner braces in many styles, and the Hartford Woven Wire Mattress Company, of Hartford, Conn., who show specimens of wire-weaving. The Enterprise Mfg. Company, of Columbiana, Ohio, have one of their small feed-mills, so constructed as to show the interior mechanism, and the firm of William H. Doppe & Son, of Buffalo, exhibit steam-jacketed kettles for soap, lard and candy-makers, and a section of a kettle showing the hollow casting of the sides.

Messrs. Clark & Wise Company, of Chicago, have built a pyramid of axle grease in various-sized packages, and the Miller Lock Company, of Philadelphia, have put up a pyramid of tin money or bond boxes, showing their keyless locks and their improved gun-metal padlocks. The lower box on which the pyramid stands is large enough to hold several bushels of collaterals.

E. L. Gaylord, of Bridgeport, Conn., has set up a line of foot-power miter-

cutters and planes, used principally by picture-frame manufactures, and Sidney Shepard & Co., of Buffalo, have made a neat little exhibit of hardware specialties. The John C. Jewett Mfg. Company, of the same city, show a handsome refrigerator of quartered oak (which will be used during the exposition by the juries on butter and dairy products) and a fine sample of their New Era water-coolers.

J. E. Smith & Sons, of Buffalo, show a full line of hand and steam power meat choppers.

The Mauris Machine Company, of Philadelphia, formerly the Teal Hoist Company, have furnished for construction purposes and for exhibit one of their patent portable hoists, and Tower & Lyon, of New York, have furnished the Chief of Machinery, Thomas R. Pickering, with a full line of their Stephens patent vises.

George M. Bailey, of Buffalo, has a large space in the industrial section for a collective exhibit of American specialties, and among the firms there represented are Bailey, Farrell & Co., of Pittsburgh, Pa., patent cartridge loaders; George N. Pierce & Co., of Buffalo, children's tricycles and bird cages; the Standard Target Company, of Cleveland, targets and traps; J. D. C. Knapp, of Minneapolis, Minn., patent vaporizers; A. H. Reid, of Philadelphia, the Lightning bit braces; N. A. Osgood, Battle Creek, Mich., a portable boat for tourists' use; Adam Reid, of Buffalo, a combination bake oven for restaurants, &c.

A. E. Foote, of Philadelphia, has a large space devoted to a complete collection of the minerals of the United States. Tiffany & Co., of New York, and the Meriden Britannia Company, of Meriden, Conn., who have the largest space in this section, will exceed all their previous efforts in the elegance and richness of their displays. In the Tiffany space is a fine Herring safe, which will be used by the jewelers and will also be an exhibit.

The Yale & Towne Mfg. Company, of Stamford, Conn., have built a village post-office in front of the office of the United States Commission, on the main aisle, and it will be used by all the Americans connected with the exposition. Near it is the large show-case of the Winchester Repeating Arms Company, of New Haven, Conn., and the space occupied by the United States Government exhibit of military and naval uniforms, meteorological instruments and geographical and geological maps and apparatus used in the departments at Washington.

The Enterprise Mfg. Company, of Philadelphia, show a full line of their hardware specialties in a large space.

Healey & Co., of New York, are among the largest exhibitors of carriages and sleighs in the whole exposition.

The exhibit of type-writers is an important one, the Hammond, Remington and Caligraph companies striving to outdo each other in the elegance of fittings and decorations. The space for these machines is next to that set aside for electrical supplies, where the first Edison phonograph will be shown. The principal exhibits here are of the Okonite Company, of New York, submarine cables and insulated wire; the Thomson-Houston Electric Company, of Boston, dynamos, electrical welding machines and electrical supplies; the Western Electric Company, Chicago and New York, electrical supplies; the American Bell Telephone Company, of New York, long-distance telephones; and the Commercial Cable Company, who show not only samples of their submarine cables, but a beautiful model of their new cable-repair steamer, the Mackay-Bennett.

The Russia Cement Company, Gloucester, Mass., show fish glues and by-products, and George Upton, of Boston, has a large exhibit of glue and sand-paper. Near his space is that of the Richmond

Cedar Works, of Richmond, Va., with a novel and picturesque exhibit of well-buckets, tubs, pails and cedar chests.

The Gorham Mfg. Company, of New York, have a large space fronting on the main aisle and rotunda, filled with silverware in rich and new patterns. On the opposite side of the rotunda are the pretty displays of the Rookwood Pottery Company, of Cincinnati, and of cut-glassware from the works of T. G. Hawkes, Corning, N. Y. These two exhibits are in charge of Davis, Collamore & Co., Limited, of New York. James G. Wilson, of New York, shows venetian blinds and rolling shutters.

Later, by cable, May 8.—At the opening the American sections made a good showing. They are more nearly ready than the French but are not so far advanced as the English exhibitors.

## THE WEEK.

The deplorable accident on the Grand Trunk Railway last week was caused by a broken axle of the engine. An expert was called in to help the jury in its examination.

The recent seizure of Canadian vessels in Behring Sea by the United States authorities for alleged trespass was the occasion of an animated debate in the Parliament at Ottawa, 26th ult., in the course of which Sir John Macdonald explained that it was an international grievance, other vessels than Canadian having suffered damages. For this reason it was not like the fisheries question.

Bishop Potter declares that Plutocracy has no place in the Republic as founded by the fathers, and that now "merchant-able ideas rule the hour."

An effort in the Canadian Parliament to remove the duty of \$2 on saw-logs was defeated, 54 to 90.

United States Consul-General Waller at London received a grand ovation in retiring from his official position. A banquet in his honor, at which Sir John Puleston, M.P., presided, was attended by Col. F. D. Grant, United States Minister to Austria, at least a dozen representatives of consular offices, besides members of Parliament and others variously distinguished, who united in presenting a costly silver cup of an artistic design showing the arms of England and the United States intertwined.

The Philadelphia committee of merchants who have been inquiring into the causes of the diversion of Western freights from that city in favor of Baltimore claim to have discovered that railroads discriminate against Philadelphia to the extent of \$1.87 per ton. The *Record* says: "While the rescuer of the Danmark was at this port several large lots of freight were offered her. One firm asked the Atlantic Transportation Line, the owners of the Missouri, for rates from this city to London. Twenty-two shillings and a half (about \$5.62) a ton, was the answer. At the same time the firm was told that if it would send its goods to Baltimore by water or rail they would be carried from that port to London for 17 1/2 shillings (\$4.37). This was a rate equally prohibitory with that demanded from this port, as freight cannot be carried from here to Baltimore for less than the difference between the two rates." The inducements controlling the action of the railroad in this matter are supposed to be very powerful.

The office of the President of the Board of Health has been filled by the appointment of Chas. G. Wilson, to succeed Mr. Bayles. The *New York Times*, which has long been the stanch advocate of reform

in the manner of official appointments, is pleased to remark: "There is no office for which special qualifications should have been more sedulously sought than that of President of the Board of Health. Under Mr. Bayles the department has been raised out of the mire of politics and has won the confidence of the community. It was of the utmost importance to maintain it in that position. Of the character and general capabilities of Mr. Charles G. Wilson we know little more than is implied in the fact that he is President of the Consolidated Exchange, familiarly known on the Street as the 'big bucket-shop,' but there is not the least reason for supposing that he has any qualifications for the place to which he has been appointed."

Consul Smithers, at Tientsin, reports that the opposition of the Chinese Government to railroad extension has at last been overcome, and China may now be said to have fairly entered upon a career of railroad construction.

The independent oil refineries are said to hold the key to the situation in the Lima oil fields. It is also affirmed that the Lima product makes an excellent illuminant.

Failures in the Boston leather trade since January 1 exceed \$1,500,000, and are attributed to "carrying too large stocks in an unprofitable time and in failing to realize on them until prices had receded so far as to wipe out what capital the concerns possessed." The business is being concentrated in fewer and stronger hands.

A fight against machinery used by shoe manufacturers in the Eastern States has been renewed by the Lasters' Union, but realizing the fact that resistance is hopeless, the object now is to form some plan or agreement by which they may share the benefits derived from the introduction of machinery, either by owning stock in last-machine companies or sharing in the royalty paid for the use of machines. The lasters feel that no association is strong enough to curb the progressive spirit of the centennial year.

The centennial train from New Orleans, with troops on board, made the trip to New York in two days—the fastest time on record.

The Boston superintendent of schools, Edwin R. Scovier, recommends the establishment of a mechanic arts high school, and the project is well received by the Boston press.

The trades school at Cleveland, Ohio, proposed by the Builders' and Dealers' Exchange will be started at once in three branches—namely, plumbing, carpentry and masonry, and preparations are making for the erection of a suitable building. The school will be in session in the evening and open only to boys apprenticed to the trades. The term is for five months, and the tuition will cost about \$35. At the close of the term the scholars will be graduated and become then what are termed "juniors," receiving about \$1.25 or \$1.50 per day. They will become journeymen when their "bosses" think they are capable. The instruction will be of a very practical character. The pupils will be expected to do actual carpenter, plumbing and masonry work and to understand the theory of their work. The plumber apprentices will be required not only to point out the defects of a poor system of sewerage but to describe a good one.

The controversy over the liability to duty of foreign-built cars belonging to Canadian railroads used in the transportation of goods between points in the United States via Canadian territory which is now pending before Assistant Secretary Tichenor was to have a hearing

May 8. If the Treasury Department should adopt an aggressive policy Canada would at once retaliate by levying duty upon or seizing cars built in the United States whenever they enter Canadian territory. This would practically nullify Sections 3005 and 3006 of the Revised Statutes, permitting the transportation in bond of imported merchandise to Canada and Mexico and of all goods between ports of the United States via Canadian or Mexican territory, and would be equivalent, under the present conditions of railroad management, to such a declaration of non-intercourse with Canada as President Cleveland asked Congress to authorize him to declare, which authority Congress declined to vest in the President of the United States.

The Northern Pacific Railroad, by assuming the management of the Wisconsin Central, acquires a line of its own extending from Chicago through to Tacoma. This is by far the longest line in the world under one management.

Acting Secretary Tichenor has informed a correspondent that cutlery tools sent to Montreal for repairs are properly subject to duty on their reimportation into the United States.

James W. Romeyn, consul at Valparaiso, reporting to the Department of State upon the trade and commerce of Chili, comments upon the fact that while imports into Chili in 1887 amounted to \$48,630,000, but \$3,200,000 came from the United States, and that while 15,000 vessels entered and cleared at Chilean ports, the American flag waved over only 221 of them.

The amount of capital invested in the United States in the rubber business is \$25,000,000. There are made every day an average of 150,000 pairs of rubber shoes, or 40,000,000 pairs a year.

Wm. H. T. Hughes, an enthusiast on the subject of extending our export markets in South America as a means of relieving the domestic market of surplus products, contends that we must have ships flying the American colors equal to those of all competitors, and to do this Government subsidies are indispensable. Mr. Hughes says: "We cannot compete with the Europeans, not as it is commonly supposed because it costs us more to build the ships or to run them; no, that is not the main difficulty. The true, the real difficulty lies in that the European lines are subsidized. I am to-day running American steamships in competition with a line subsidized by the Spanish Government, and unless our steamship lines are placed on the same footing competition is out of the question. Why cannot our Government adopt the same policy pursued by the English, the French and the Germans, and subsidize such steamers as may be built in conformity with the requirements necessary to turn them into commerce destroyers in case of emergency? Would this not be a more economical policy than the building and maintaining of a large fleet of special cruisers?"

Governor Washburne, of Minnesota, is of the opinion that the two railroad lines from that State to Sault Ste. Marie, where they will connect with the Canadian Pacific, are destined to do a large freighting business with the Northwest.

On account of the scarcity of glass-blowers in this country manufacturers are attempting to supply themselves from abroad without previous contract. A number have been obtained in this way. At a meeting of the Glass-blowers' Association in Pittsburgh a member from Baltimore announced that two factories in that city are now idle because they cannot get enough blowers to operate

the works. President Campbell said he did not know of any idle glass-blowers in the country that wanted work and were not engaged. The report published that there are 1040 pots in operation and 252 idle may be correct; but that does not indicate that there are idle workmen. Many of these pots, he said, are idle because there are not enough experienced men to operate them, and some of them are not in operation because the works have been burned down.

John Hicks, the new Minister to Peru, sailed on the City of Para for his new station at Lima.

According to a Paris paper Edison has combined the phonograph with the clock in a most ingenious manner. Instead of striking the hour the clock calls out in well-modulated tones, "Dinner time," "One o'clock," "Two o'clock," etc. Workmen will be particularly pleased with a clock that tells them audibly that it's "time to quit."

The building boom in Brooklyn last month was unprecedented. The proposed improvements for which permits were issued will cost upward of \$4,000,000.

The new court-house at Pottsville, Pa., will cost \$200,000, and have walls combining stone, pressed brick, terra-cotta and galvanized iron, with copper and iron cornice and iron beams throughout.

The Post-office Department at Washington will hereafter be closed on Sunday.

At the first annual dinner of the Spanish-American Commercial Union, held in this city last week, J. M. Ceballos presiding, the Secretary of the Interior, John W. Noble, said that it devolved on the merchants of New York City to open up the trade that was awaiting development between the two Americas—North and South. A line of steamships should be established between the United States and the Southern part of the American continent, a rapid, reliable means of communication.

Referring to the material progress of the American people during the past century, the president of Cornell University, in a speech at Pittsburgh, said: "Within this hundred years how has civilization been transformed! When Washington took the oath of office, Watt had just produced that most wonderful of inventions, which not only, as Lord Jeffrey said, could 'draw out without breaking a thread as fine as a gossamer, and lift a ship of war like a bauble in the air,' but was to thrust its myriad arms into the varied activity of life, and so usurp the control of all the industries of the world. George Stephenson, a boy of 8, was learning to read at a night-school in Northumberland, little dreaming at that time of the curious machine with which, just 25 years later, he was to astonish the world by drawing the first train of railway cars at the rate of four miles an hour. Arkwright had, three years before, been knighted by George III for his invention of the spinning-jenny, and Crompton was just reaping the first fruits of his new invention of the power loom. This series of inventions, unparalleled in the history of industry, was just ushering in a new era of material development."

Twenty-two States participating in the Washington centennial were represented by their governors. Since the Yorktown celebration there has never been seen so large an assemblage of American war vessels as was grouped in New York Harbor on the day of the naval parade, April 29. In all there were 11 war ships and four revenue cutters.

Manager Hain, of the Manhattan Elevated Railway, has said that about 2,346,000 fares were taken during the three days

of the Centennial. This is an average of 782,000 a day, and specifically, Monday, 765,000; Tuesday, 825,000; and Wednesday, 756,000. Estimated in dollars the returns were \$117,800. Over 607,000 persons crossed the Brooklyn bridge and 642,000 by the Brooklyn ferries. Altogether, according to the most careful estimates, about 1,800,000 people visited the city. The industrial parade was nearly six hours in passing a given point.

The consolidated gas works in St. Louis will represent an investment of \$9,000,000, for which bonds and stock will be issued to the extent of \$12,500,000.

Vancouver, B. C., the Western terminus of the Canadian Pacific Railway, is a thriving city of 13,000 inhabitants.

It is estimated that the money cost of the celebration in this city was over \$2,000,000. The Centennial Committee disbursed about \$400,000 and the Army Committee from \$100,000 to \$120,000. The State and city appropriations amounted to \$225,000, of which \$125,000 was for the expenses of the National Guard. The cost of the 20 floats furnished directly by the Artists' Committee was \$14,000. The 40 floats supplied by societies and trades cost \$27,000.

The inventor of the Hotchkiss gun, who died in Paris not long ago, left an estate valued at \$12,000,000, which is now disputed by the heirs. The question of domicile, on which the division depends, is the point at issue.

Sir Julian Pauncefote, the new British Minister at Washington, in his formal presentation to the President, said his "utmost endeavors will be devoted to the object which Her Majesty and her people have so much at heart, the maintenance of the relations of peace and friendship which happily subsist between Great Britain and the United States, and the strengthening, if possible, of the many ties which unite these two great English-speaking countries."

American legations in foreign countries will hereafter be augmented by the assignment of a military *attaché*, whose duty will be to make reports upon all military operations, experimental and otherwise, means of defense of the country in which they are residing, military inventions, and in fact upon all military subjects in which this country has any interest.

A prominent banker in Texas, now visiting New York, says the census of 1890 will show that his State has a population of 3,000,000. "The resources of our State are unlimited. They call us a prairie State—yet we have 25,000,000 acres of virgin pine forest. We are a cattle-raising State and a wool-raising State, and still we raise more cotton than any other State. Recent investigations show that we have iron in large quantities in our hills. The hematite ores in the Jefferson and Rusk districts are just being developed, and in the Llano iron district magnetic and specular ores have been discovered assaying 60 to 70 per cent. in large quantities, along with fine beds of manganese."

The stream of immigration across the continent to Washington and Oregon shows no signs of diminishing, and promises to continue all summer.

The Dominion Parliament during the session ended 1st inst. devoted much attention to the subject of steamship subsidies. Between British Columbia ports and China and Japan an improved steamship service was provided for, the Government obtaining from Parliament power to give a subsidy of \$75,000 yearly for a monthly service and of \$125,000 yearly for a fortnightly service, the British Gov-

ernment supplementing these subventions with grants according to the frequency of the voyages. The service to England and Australia was not provided for.

One of the local passenger railways in Philadelphia is having six storage battery electric cars built, the largest to be equipped with two motors of 10 horsepower each, and to be eight-wheeled.

The cotton manufacturers and cotton planters of the South are thoroughly aroused in their opposition to the Jute Trust. The Southern Manufacturers' Association permanently organized in Augusta 1st inst., with H. H. Hickman, of that city, president, and by invitation the Farmers' Alliance, of Georgia and South Carolina, shared in the proceedings. About 50 mills in Georgia and neighboring States were represented, and Augusta was selected as the central headquarters. Contracts were made with the mills for 2,000,000 yards of cotton bagging, to be delivered on August 1.

The competition of the Lake Superior routes with Chicago excites much interest in the West. There is nothing new in the fact that the routes recently opened via Duluth and other Lake Superior ports tap the Northwestern wheat fields, but the importance of changes thus made in the currents of traffic has not been fully comprehended.

The weight and bulk of the gold and silver coin now held by the United States Treasury forms the subject of inquiry by a correspondent of a mathematical turn of mind, and he finds that the weight of the gold is 601 tons of 2000 pounds, and the silver 8009 tons. Packing it along the highway as cord-wood is packed, the gold would make a barricade 4 feet high and 4 feet thick for a distance of 335 feet, and the silver, if similarly packed, would extend 4248 feet, or five-sixths of a mile. If packed in carts, 1 ton to each cart, the procession would be nearly 33 miles long, of which distance the gold-bearing carts would cover 2½ miles and the silver a fraction over 30½ miles.

Major G. J. Lydecker, Corps of Engineers, who was charged with the supervision of work on the Washington Aqueduct tunnel, but failed to detect and correct the shams that were practiced by the contractors, was heavily fined and reprimanded under a decision of the court-martial which had jurisdiction in his case. The President, in approving of the sentence, says the failure of duty is "a discredit to the engineering profession," and entirely inadmissible.

Under the auspices of the French Government a company propose to build a railroad from the new port of Tien-yen, in Tonquin, and along a tributary of the Canton River, opening a territory inhabited by 120,000,000 people, substituting modern means of transportation for caravans and junks.

Real-estate dealers in New York notice a growing disposition on the part of leading business men in the West and South to fix their domicile in this city. For this and other reasons values are firmly held. During the four months ending May 1 \$25,000,000 more of property changed hands in the city and county of New York than during the corresponding months of 1888. Allowing for dullness during the summer solstice, the real-estate market will show a total of transactions for the year 1889 surpassing \$300,000,000—an unprecedented figure. New York has erected during the past four months \$10,000,000 of buildings in excess of the figures for last year.

The Argentine Republic, it is expected, will receive by immigration this year an accession of 370,000 to its population, principally from Italy.

## MANUFACTURING.

## Iron and Steel.

McKeefrey & Hofins, who are operating the Grafton Furnace, at Leetonia, Ohio, were compelled to bank one of the stacks last week on account of a strike of the iron-carriers for more wages, which was refused by the firm. They inform us that they expect to secure new workmen, and will likely put the stack in blast again this week.

On Saturday, the 27th ult., the management of the Jefferson Iron Works, of Steubenville, Ohio, notified all the nailers in their employ operating cold-nail machines that after that date their services would not be required. This action caused about 40 nail machines to be thrown idle. On the following Monday pickled iron was introduced and a portion of the discharged nailers were re-employed, each one to run eight machines.

On Saturday, the 27th ult., the Bellaire Iron Works, of Bellaire, Ohio, arranged a wages scale with their nailers by which the nail factory of the firm, which has been idle for some months, will resume operations in a few days. The scale of wages adopted will be based on the 16-cent card less 38 per cent. on nails  $1\frac{1}{4}$  inches long and under, and  $12\frac{1}{2}$  per cent. deduction from the 16-cent card on all nails over that length. The usual  $12\frac{1}{2}$  per cent. for self-feeders will be taken off before the reductions mentioned are made. No pickled plate will be used. The Laughlin Nail Company, of Wheeling, W. Va., whose factory is located at Martin's Ferry, Ohio, have also notified their nailers that they will have to work on a scale of wages similar to that adopted at Bellaire. It is probable that the men will accept. It is expected that similar action will be taken by every nail concern in the Ohio Valley.

The puddling department of the American Iron and Steel Works of Jones & Laughlins, Limited, at Pittsburgh, is idle because the main shaft of the Corliss engine in it broke last week.

A Sheffield, Ala., dispatch states that the Sheffield and Birmingham Coal, Iron and Railway Company have sold their railroad, extending from Sheffield, Ala., to Jasper, Ala., 87 miles, to Alfred Parrish, of Philadelphia, Pa. Mr. Parrish has named the road the Birmingham, Sheffield and Tennessee River Railway. The three new coke blast-furnaces and the coke ovens, coal mines, &c., on the line of this road, which are owned by the Sheffield and Birmingham Coal, Iron and Railway Company, will continue to be operated by the latter company.

Oliver Bros. & Phillips and the Republic Iron Works, Limited, of Pittsburgh, recently closed the purchase of a large block of territory in the Bellevernon natural gas field, including a well flowing at heavy pressure, and will immediately proceed with the construction of a pipe line to connect their works therewith. The work will be pushed forward to completion as rapidly as possible. Both concerns are now supplied by the Philadelphia Company's line.

The plant of the Cherry Valley Iron Company, at Leetonia, Ohio, resumed operations on April 15 and continued in operation until the 25th, when it closed down in all departments. It is not known when operations will be resumed again.

Adolph Pluemer has been appointed receiver of the Etna Iron Works, of Iron-ton, Ohio, on application of Albert W. Osler and himself. Bond has been fixed at \$25,000, signed by Adolph Pluemer,

Lipman Levy, Herman C. Besuden and John C. Davis. The corporation has not paid the expected 6 per cent. dividend within the last few years, and therefore any one of the last stockholders has the right to pray for a receiver, which prayer was promptly granted in this case.

The entire plant of Brown, Bonnell & Co., at Youngstown, Ohio, closed down last week for a short period for the purpose of making necessary repairs. As soon as these are completed the finishing department will be started up, while the puddling department will be allowed to remain idle until the surplus stock of puddled iron is worked up.

Furnace No. 2, of the Glendon Iron Company, at Easton, Pa., has been blown out for the purpose of being extensively repaired. Furnace No. 3, which has recently been overhauled, has resumed blast.

At the plant of the Bethlehem Iron Company, at Bethlehem, Pa., the largest steam hammer in the world is being set up and two 80-foot annealing furnaces are being erected at the ordnance works.

At the McDonald Rolling Mills, St. Louis, a 3-ton Morgan hammer has been placed in position. Under a pressure of 80 pounds it is capable of giving a blow of 36 tons. It has a 5-foot stroke, and the face room or die is 24 x 14 inches.

From a recent issue of the Reading, Pa., *Times* we take the following: "The P. and R. rail-mill in the northern section of the city has been leased by a party of New York capitalists, who will start the mill as soon as possible and manufacture steel tools. They have a new process of manufacturing steel, and after a number of improvements have been made the mill will be started."

The blast-furnace, engines and other property of the old Duluth Iron Company, at Duluth, Minn., have been sold to satisfy a judgment of \$130,000. In 1883 Walter Mann, of St. Paul, the trustee of the property, purchased 100 \$1000 shares of stock, and when the company stopped business a mortgage and trust were executed to him to make good his interest in the concern. There were no bidders for the property besides Mr. Mann.

The situation of affairs at the works of the Allegheny Bessemer Steel Company, at Duquesne, Pa., where a strike has been in progress for several weeks, is unchanged, but from present appearances a settlement is very near.

The Sharon Iron Company, of Sharon, Pa., are putting in a new battery of boilers. They are also making preparations for erecting a gas furnace for the guide mill. The building of this furnace will equip all their finishing mills with gas furnaces.

The plant of the Western Nail Company, at Belleville, Ill., will be offered for sale on Saturday, the 25th inst., at the court-house at that place.

To supply their hoop-iron trade, P. L. Kimberly & Co., Limited, of Sharon, Pa., have decided to add a new 7-inch train to their plant.

The Meriden Malleable Iron Company, one of the big concerns of Meriden, Conn., is financially embarrassed, owing to several recent failures of Western houses whose notes the company held. The employees in the iron and brass foundries were informed that their services would not be required until further notice. About 250 men are thrown out of work. The gentlemen connected with the firm are all men of integrity, and the company have nothing to conceal. At a meeting of the

directors and prominent stockholders the management presented a statement showing liabilities \$180,000 and assets \$280,000. The only embarrassment was from a lack of ready cash to meet notes, of which \$12,000 has recently come back unpaid owing to the failure of heavy creditors. The assets consist largely of fine buildings built some years ago.

The new charcoal blast-furnace of the Mont Alto Iron Company, at Mont Alto, Pa., was destroyed by fire 80th ult. The furnace was entirely new and had been put into operation only two weeks ago.

Col. Enoch Ensley has purchased the Sheffield Furnace, at Sheffield, Ala., and will put it in blast as early as practicable. The price paid has not been made public. The stack is 75 x 17 feet and was completed and made a run in 1888. The Lady Ensley Furnace at Sheffield, also owned by Colonel Ensley, was started for the first time on April 22. This stack is also 75 x 17 feet. Both furnaces will be supplied by ore from the Ensley mines at Russellville, Franklin County.

Thomas H. Hays, 155 Third avenue, Louisville, Ky., desires to be placed in communication with parties owning a blast-furnace plant capable of producing 75 to 100 tons who are willing to move it to a locality where good coking coal and brown hematite ore are available, within a short distance of a railroad.

The Warren Furnace, at Hackettstown, N. J., is to be blown out on account of the dull state of the iron market. The company have a considerable quantity of iron on hand.

The Susquehanna Rolling Mill, at Columbia, Pa., whose puddlers have been on strike for the last six weeks, partially resumed work on Monday with new hands. The old men were offered places, but refused. The company expect to have the mill running full in two weeks.

Contracts have been let for the building of a furnace at Fort Payne, Ala., by the Fort Payne Coal and Iron Company.

Singer, Nimick & Co., of Pittsburgh, are putting in a Boulton apparatus for making solid-steel ingots, manufactured by the Solid Ingot Company, of Newark, N. J. The apparatus has been in use since December, 1887, at the West Bergen Steel Works of Spaulding & Jennings.

Under the management of H. E. Burt, Minneapolis Furnace, at Black River Falls, has been doing some excellent work. In April in ten days it produced 706 tons, or 70.6 tons per day. For this period the yield of the ores was 52.1 per cent. The consumption of fuel was 1775 pounds of charcoal, braise included, per ton of product, the average limestone charge per ton of output being 290 pounds. The blast temperature averaged 1600°. The furnace went into blast on December 5, 1887, its actual run being 447 days 10 hours. It is estimated that it will run six or eight months longer. Considering the fact that the furnace is only 55 feet high, with 11-foot bosh, its record certainly ranks among the very best.

Carnegie Bros. & Co., Limited, of Pittsburgh, have commenced suit in the courts at Columbus, Ohio, against the Columbus and Eastern Railroad Company to collect the sum of \$65,022.81 claimed to be due for rails and other materials furnished. They ask interest on the sum of \$51,061.37 from March 1, 1889.

The Scranton Steel Company, Scranton, Pa., running only 47 shifts with two of ten converters, made in April 18,303 gross tons of ingots and 15,879 gross tons of

rails. The same company, running only 42 shifts, made 17,086 tons of ingots in March.

The plant of the Newport Iron and Steel Works, at Newport, Ky., was sold at sheriff's sale on the 4th inst. to John W. Schneider, who is supposed to have made the purchase in the interest of sureties for \$100,000 indebtedness of the concern.

#### Machinery.

The National Switch and Signal Company, a recently incorporated company, have leased the buildings formerly occupied by the Iowa Barb Wire Company, South Easton, Pa., and will shortly begin the manufacture of their patent switch system. A switch of the kind the company are to manufacture is in service at the intersection of the Lehigh Valley's Roselle Branch. Another is ready to be put in at Packerton, and a third is to go in at the cotton factory at South Easton. W. A. Wilbur, of South Bethlehem; Richard Caffrey, of White Haven, and W. F. Pascoe, of South Easton, are among the directors of the company.

The Union Switch and Signal Company, of Pittsburgh, have greatly improved their facilities for capacity at their works at Swissvale, and are employing 200 hands in the shops, in addition to about the same number on the road erecting plants. The most recent, and probably the largest, pneumatic plant of this kind ever ordered is now being built by this company for use at the Union Depot and yards at Kansas City, Mo. It will be ready for operation in about 90 days.

The Machinists' Supply Company have removed to 167 and 169 Lake street, Chicago, to secure more room for their growing business. They carry a full stock of machinists' tools, lathes, drills, &c., and their enlarged quarters will enable them to handle a much greater variety of such goods than they were able to keep in their former location.

The Altoona Mfg. Company, of Altoona, Pa., are putting in two 48-inch x 25-foot boilers, and two 100 horse-power rope-hauling engines for the New York and Cleveland Gas-Coal Company, at Turtle Creek, Pa.

Increased business and the necessity of more ample accommodations have caused B. F. Sturtevant, manufacturer of blowers, heating apparatus, engines, &c., to move his New York branch office to No. 91 Liberty street, where he will be better able to meet the trade. He has also recently established a branch at Portland, Ore., under the management of O. C. Gove, who will handle the rapidly-increasing trade of the Pacific Coast.

The Trenton Iron Company, at Trenton, N. J., are so crowded with orders for their locked wire rope that they are building a second machine. They have also added recently a large machine shop to their plant.

Bids were opened at the Navy Department on the 1st inst. for supplying the machinery of the battle-ship Texas, now building at the Norfolk Navy Yard. The bids were: Richmond Locomotive and Machine Works, \$634,000; N. F. Palmer, Jr., & Co., of New York (Quintard Iron Works), \$682,500; Southwark Foundry and Machine Company, of Philadelphia, \$645,800; Charles Reeder & Sons, Baltimore, \$718,900. The I. P. Morris Company, of Philadelphia, put in a bid of \$694,750 for constructing the machinery according to the Department designs but with their own modifications.

T. William Harris & Co., of 44 Broadway, New York, have the contract for the construction of the Eleventh Ward Street Railway in Syracuse, N. Y. They

have a large force of men, and the work is being rapidly pushed forward.

The Buffalo Steam Pump Company, Buffalo, N. Y., have opened an office in the Commerce Building, St. Louis, Mo. Theodore Allen, Mem. Am. Soc. C. E., has been appointed manager, and will have charge of the territory south of the Missouri line and west of the Ohio line to the Pacific Coast.

Among the recent sales of the Curtis Regulator Company is an 8-inch steam separator for the Tremont Nail Company, of West Wareham, Mass. This is the third large separator they have furnished for these works. They are also making a 10-inch separator for the Alexandria Bay and Thousand Islands Steamboat Company, Carthage, N. Y. Each separator is provided with a balance-trap that automatically delivers the condensation into the hot well.

The Brown & Sharpe Mfg. Company and Darling, Brown & Sharpe have recently issued in pocket size a very complete illustrated catalogue showing the apparatus manufactured by them. The first portion of the book is devoted to the Brown & Sharpe line of milling machines, grinding machines, automatic gear cutters, engine and hand lathes and milling cutters, and also calipers and gauges, for which this firm have earned such a widespread reputation. The Darling, Brown & Sharpe portion of the catalogue shows graduated scales of improved form, gauges and calipers of various kinds. A copy of this catalogue will be furnished on application, and will be found to contain much matter of interest in addition to the descriptions and illustrations of the tools manufactured.

J. A. & S. F. Dunkle, of Steelton, Pa., and J. B. Ewing, of Harrisburg, Pa., have bought the entire plant and goodwill of the Star Steam Heater Company, of Mount Joy, Pa., including the exclusive control of the patents. Large and commodious shops will at once be built at East End, Harrisburg, Pa., according to new plans especially adapted for their business. Three departments—viz., boiler-making, machine and foundry—will be fully fitted out with the best machinery. It is expected that the shops will be completed some time during July, when they will immediately be occupied. Meanwhile operations have begun in the old shops in Mount Joy, where work is being pushed to its utmost to supply the demand. The address of the firm is Star Steam Heater Company, Harrisburg, Pa., or until after August 1 Mount Joy, Pa. H. H. Lindemuth, the patentee, has connected himself with the new firm and will give the boilers his personal supervision.

The Thomson-Houston Company, of Boston, have been obliged to greatly increase their facilities in order to handle their rapidly-growing business in electric railways. In addition to the large contracts closed some time ago they have lately obtained the following: Lynn and Boston Railroad Company, from Central Square to Nahant House, Nahant, 4300 feet of track; Newburyport and Amesbury Horse Railway Company, Newburyport, Mass., a line about 6 miles in length, and made up almost entirely of curves and grades, the maximum being 10 per cent.; the Newton Circuit line, Newton, Mass., 8 miles in length, from Newton to Watertown; the Plymouth and Kingston Railway Company, Plymouth, Mass., 4 miles in length, from Chiltonville through Plymouth to Kingston; Quincy Street Railway, Quincy, Mass., 5 miles in length, from Quincy through Wollaston Heights and Atlantic to the Neponset River. The company have also constructed a track of about 1 mile for the Hillside Coal Company, at Scranton, Pa., on which a 40-horse-power

electric motor is used for carrying coal, capable of carrying about 20 cars loaded with 1 ton each. These roads will use altogether some 22 motors. Orders have also been received for new cars from many of the roads already in operation. Work is progressing rapidly on all the roads which the company have under contract, and it is expected that very soon some of them will be put into operation.

#### Hardware.

A charter was filed in the Recorder's office at Pittsburgh last week for the Pittsburgh Electric Scale Company. The capital stock of the company is \$10,000, divided into 100 shares at \$100 per share. The directors are M. W. Rankin, John W. Nevin, Charles E. Billin, W. F. Bickel, I. S. Reymer, R. B. Petty and F. G. Paulson.

E. C. Atkins & Co., Indianapolis, Ind., write, under date of 3d inst., that business in their circular and band saw departments is good, being considerably behind in their orders. They also advise us that they have just established an agency at Minneapolis, Minn., with repair works, and purpose to carry a full stock of saws, and later to do an extensive business there in mill supplies.

The Maryland Tack Company, Baltimore, Md., are reported to be meeting with good success under the new organization. Their larger plant, modern and extended facilities, additional machinery already in and arriving and improved methods of manufacture are all due to as putting them in a position to make with advantage an excellent quality of goods.

The Akron Hardware Company, Akron, Ohio, have been reorganized, and, we are advised, with increased capacity. They manufacture a line of metal and glass rosettes, crystal and metal front hubbands, steel-mouth, hand-forged bridlebits in a variety of finishes, whip sockets, spurs, buggy seat handles and a line of saddlery specialties.

A recent issue of the *British Ironmonger* contains the following reference to the business of A. J. Jordan, St. Louis and Sheffield, an enterprise of exceptional interest, as that of an American manufacturer making his goods in England:

Mr. A. J. Jordan is well employed in his specialties of fine pocket cutlery, of which increasing consignments are being made to the United States. The tendency is decidedly in favor of the highest qualities, the plainer descriptions, such as a good, plain pocket-knife, with a serviceable blade and cheap handle, being less inquired after by Mr. Jordan's American customers. He is also meeting a growing demand in the States for his fine Sheffield razors, put up in cases, while on the other hand his English trade for the American Star safety razor is also well maintained. The United States demand for Mr. Jordan's specialties in fine case goods, such as ladies' companions, caskets and similar goods, is very active. Recently Mr. Jordan completed for private presentation a case of carvers deserving of more than passing notice. A feature in this instance was the mother-of-pearl handle of the carver, which was made of one of the largest pieces of mother-of-pearl that has been dealt with in Sheffield. Indeed, those who saw the mother-of-pearl declared that if the country had been searched through there could not be found another piece to equal it.

Raymond Lead Company, Chicago, Ill., have added to their other departments the manufacture of a line of mixed metals, including babbitt, solder, electrotype, stereotype and type metals, ingot brass of all grades, and a variety of special mixtures. For the accommodation and successful handling of this undertaking they have enlarged their facilities and added new machinery of the latest improved pattern, which gives them a very complete plant. This department will be under the personal control of Frank R. Cargill, former manager of the mixed metal department of E. W. Blatchford & Co.

The Chicago editorial and business offices of *The Iron Age* have been removed from 95 and 97 Washington street to 59 Dearborn street.

## The Duty on Mexican Lead-Silver Ores.

In a week from now a very important hearing will take place at the Treasury Department in Washington on the admission free of duty of the lead contents of foreign silver ores. Great interests are likely to be arrayed on both sides of the question, the decision of which will have a direct effect upon the markets of the base metal. In fact, the price of lead has already stiffened.

A brief review of the leading features of our lead-smelting industry will be necessary to point out in which manner different interests are affected by a possible change in the present ruling. The lead-mining industry is generally classed in two great groups, that of the Missouri and Kansas, making a product practically free from silver, and that of the Rocky Mountains, closely allied with silver mining and extraction. The first, which turns out annually from 25,000 to 30,000 tons of metal, is not directly interested, except to the extent to which a lessening of imports is likely to create higher prices.

In the Rocky Mountains the interests are more complex. We have first the owners of the lead mines and the communities dependent upon them. Then a certain large number of silver mines, large and small. A third interest are the smelters, and a fourth the desilverizers and refiners. Back of them all are the railroad companies, some of whose directors are also individually identified with smelting or desilverizing enterprises. The owners of lead mines throughout the Rocky Mountains are, of course, very anxious that the free importation of lead in ores should stop. The position of the others mentioned is dependent upon their location geographically. American silver ores are purchased in large quantities by the lead smelters in the Rocky Mountains, to be treated together with the lead-bearing ores. The base metal is merely, so far as the metallurgical operation is concerned, a carrier of the precious metal. The silver in the ore alloys with the lead and is thus extracted cheaply and completely, where other methods would not answer so well. On the whole, the quantity of the "dry" ores not containing lead is in excessive supply, so that the majority of the smelters are eager competitors for lead ores. The result is that the price paid for the base metal in the ore is very close to what it will fetch in the market, adding freights and allowances for waste, &c. The profits of the smelters must therefore come from the "dry" ores. If the lead market is low or is largely supplied

from any locality too far distant from them as a possible source of supply, then the amount of lead ore offered to them must decrease. The smelters of that particular locality must either pay relatively high prices for the lead in the ore, as compared with what they can get for it when they have run it into bars, or they must restrict their operations and squeeze the miners of dry ore harder. The owners of silver mines which yield these "dry" ores are, of course, directly affected by whatever benefits the interests of their local smelters. Within this category come the entire lead and silver mining and smelting interests of Montana, Idaho, Colorado and Utah.

In the Southwest the situation is different. The lead-mining interests of Arizona and New Mexico thus far are unimportant. The smelting interests, relatively greater, are based very largely upon the imports of Mexican ores. They come in under the present interpretation of the law which classifies as a silver ore, free of duty, any ore the chief component of value of which is silver, no matter how much lead it may contain. These interests will be found very vigorous opponents of any change, and are likely to have the sympathy and support of the silver miners in New Mexico and Arizona who are their customers.

A third group of interests is represented by the lead desilverizers at Omaha, Kansas City, Aurora, Ill., and St. Louis. All of them are to a greater or less degree smelters of ore also. Two of them handle a very considerable quantity of Mexican ore, and, that part of their business preponderating, may be found in the ranks of the opponents of any change. One of them, besides, is identified with the National Lead Trust, which embraces about 60 per cent. of the whole production of white lead. With them cheap raw material may prove a potent reason for an attitude of opposition. It is likely, too, that manufacturers of sheet lead, pipe and shot will incline in the same direction.

A very powerful interest sharply divided will be the railroads. Those which penetrate from Missouri River points into Montana, Idaho, Colorado and Utah will vigorously demand justice, among them being the Northern Pacific, Manitoba, Union Pacific, Central Pacific and Chicago, Burlington and Quincy, the directors of some of them being personally interested in the industry. The Mexican roads and those American lines having a greater or less identity of interests with them will be arrayed on the other side.

We may finally note that a small group of men will watch the proceedings with the keen expectation which grows out of the hope of getting out of a very bad bargain scared but unscathed. We allude to the bankers and dealers who had confidence enough in the genius of the fallen lead king to advance 4 cents on upward of 12,000 tons of lead. The metal has hung about 3.75 cents ever since the collapse, so that they seemed hopelessly stranded. If the importation, free of duty, of lead in Mexican silver-lead ores can be stopped they may expect to recover their advances and possibly secure fair interest, too.

There are strong forces arrayed on both sides of the question, and whatever merits

there are in it, pro and con, will probably be brought out. The weight of influence appears to be with those who claim that it is unfair to call a 50 per cent. lead ore a silver ore because it happens to carry also 50 ounces, or 0.16 per cent., of silver. One point may be touched upon during the hearing, and that is to what extent fraud has entered into this business. It is charged that in Mexican sampling works enough rich silver ore is added to lead ores deficient in the precious metal to carry them up to the requirements. How easy such doctoring would be, and how difficult of detection, may be easily appreciated.

## Trusts in Canada.

The popular voice clamors against so-called trust combinations among tradesmen, and in the case of the Sugar Trust the courts have branded it with the stamp of illegality. Yet so far it would appear that no effective measures can be devised to suppress an evil pregnant with the worst possibilities. While the whole subject thus seems to remain in abeyance so far as concerns the United States, we may obtain a more complete appreciation of the deplorable consequences which befall a community—the helpless humiliation and enslavement which may be entailed through the prevalence of trust organizations—by turning on the side-lights. To do this we need not go further than the neighboring Dominion of Canada. There trusts are experienced in their most aggravated features, so that as a matter of fact a man's dead body cannot be decently interred until the survivors have paid blood-money to the undertakers' trusts, who dictate the terms upon which this privilege may be granted. Neither can he have coal to keep himself from freezing, nor salt, nor provisions and food for his subsistence until he has paid the precise amount of tribute agreed upon by the ring who corner the entire available supplies of these classes of merchandise. At last there is a popular revolt against these exactions, and from the tone of the recent debates in Parliament it would appear that the general sentiment is almost unanimous in favoring a bill for their suppression, introduced by N. Clarke Wallace, M.P. It was ascertained, however, before the adjournment last week that an obstruction existed of a formidable character. From some source it was plainly intimated that there could be no further "contributions to the election funds" if the bill was permitted to pass.

The bill provided, among other things, heavy penalties against every person who agrees or arranges with any other person or with any railway or transportation company unlawfully to limit the facilities for transporting, producing, manufacturing or dealing in any commodity which may be a subject of trade and commerce, or to restrain or injure trade or commerce in relation to any such article or commodity. The bill was finally shelved in the Committee on Banking and Commerce.

The circumstances provoking legislation of this character may be gathered from one of the speeches directed against combinations in restraint of trade. It was stated that in Ottawa, the capital city, three men controlled the entire business of importing or selling coal. In Toronto a similar combination existed, which placed

dealers under surveillance and required oaths of fidelity from all in their employ. In cases where the Dominion or the local Government or charitable or public institutions asked for tenders for the supply of coal, the coal ring decided what price should be demanded, and they put up at auction to the members the privilege of supplying the coal at those prices. In some instances as much as \$1500 was paid as a bonus for the privilege thus secured.

Again, the wholesale grocers' guild agreed with the sugar refiners that the latter should sell their product to members of the guild at an advantage as compared with all others, the prices to retailers being definitely fixed. This arrangement proved to be so satisfactory that the guild extended the combination in other directions, securing large profits from the sale of tobacco, starch, &c., and excluding others from all participation, except at advanced prices. Manufacturers of binders' twine in like manner formed a combination to regulate prices and output, advancing prices 50 per cent. as compared with last year. Respecting the coffin business, Mr. Wallace made the following extraordinary statement: "The coffin-makers and manufacturers of coffin supplies had undertaken to sell to none but members of the Undertakers' Association. In order to become a member of the Undertakers' Association, a man had to get the consent of three out of four of the nearest undertakers living to him; of course in a small town that was impossible. The result was, as we have evidence before the committee to prove, that they became a close corporation and nobody could enter the business. Their freedom was interfered with and they could not enter into the business of undertaking, because the manufacturers of coffins and of coffin-makers' supplies were prevented from selling them goods." The trust problem is enviroined with difficulties, as abundantly demonstrated both in the Dominion and in the United States, in New York City as well as in Congress. In Europe it is no nearer a solution. But there are limits beyond which "legalized robbery" will not be permitted.

"It is an ill wind that blows nobody good," and the adage is being exemplified in the present era of depression in the iron trade. Those who are building new blast-furnaces, rolling-mills and steel-works have struck a most fortunate season for pushing their undertakings. They will be able to erect their buildings and install their machinery at perhaps a lower cost than ever before in the history of this country. Some of the contracts of this character which have recently come under our notice have been placed at marvelously low prices. This applies no less to brick and other building material than to the part of the structure into which iron and steel enter. The depression of prices appears to be universal. With respect to machinery a given plant may absorb as much capital as ever, but the character of the equipment will be of the most advanced type and will embrace appliances and labor-saving devices which but a short time since would have required the investment of a much larger amount of money. It is a good time to build new works, to improve old ones and to expand generally in directions and in localities in which a reasonable hope of a more pros-

perous future affords a basis for such operations. The time will come, and it may be soon at hand, when the facilities of production will again be taxed to meet the requirements of our growing country. The use of iron and steel is not going out of fashion, and there may be room early in the future for new works even in the branches of the trade which are now most seriously depressed and are suffering from what we so naturally term overproduction.

#### The New Silver Coinage and Recoinage in China.

Should all the governments that have been invited attend the same, the congress of all American nations will assemble at Washington in October next, and among the common measures proposed the one of an international silver coin is likely to be adopted. The question will then arise what silver dollar and fractional coin will best recommend itself not only for circulation in the New World, but also for trade purposes in East India, Japan and China, in view of the rapidly-growing commerce between the American West Coast and Asiatic countries named. The Mexican dollar has for more than 60 years been the universally accepted and most popular silver coin in this American Asiatic traffic, because of its reliableness and uniformity. It is bought and sold in the London market in enormous amounts for shipment to the far East, and untold millions of it circulate in China in a disfigured state, being stamped with Chinese characters, both Government and private. Now, however, the Chinese themselves begin to look upon the Mexican dollar with less favor, even in its untarnished condition as it emanates from the Mexican mint, because of its clumsy appearance. They have been studying this monetary question all the more seriously and thoroughly for a year past, as they want to make a change, and a general reform of their system of coin circulation has been resolved upon. They have adopted a silver dollar and fractional coin of their own, beginning with the Kwang-tung province, which is to be the first to receive a sufficient supply.

A large mint has been ordered from Ralph Heaton & Sons, Birmingham, England, and erected at Canton, where, with 90 coinage stamping-presses in operation, it is at present turning out daily 2,700,000 "cash" pieces, together with silver coin for the province named. The so-called "cash," or "li," as this brass coin is called in China, is being turned out to take the place of the old cast "cash," now being withdrawn from circulation, 1000 cash representing a silver dollar, and each being perforated—like the old—with a square hole. This new coin is of a better composition and superior impression, elegant in appearance, and resembling the new "papeques" which France is coining for Cochin China.

The new Chinese dollar has also taken the place of the new "piastre du commerce" which France has coined for Indo-China for a model, and has nearly the same weight; it weighs 27.27 grams, while the Franco-Asiatic dollar weighs 27.21. The Chinese dollar bears on one side the image of the dragon, and on the reverse Chinese characters encircled by the English words: "Kwang-tung Province, 7 mace and 3 candareens." The weight corresponds to

420.88 grains. The fractional coin is of the same standard, thus:

	Grains.
1 dollar, 7 mace, 3 candareens	= 27.27
1/2 " " " " " "	= 13.63
20 cents, 1 " " " "	= 5.46
10 " " " " " "	= 2.73

The new coin compares with others as follows:

	Grains.	Fine.	Grains fine.
Chinese dollar	420.88	0.900	378.8
Old Mexican dollar	415.68	0.901	374.5
New Mexican dollar	415.68	0.902 1/2	375.2
Old Japanese yen	420	0.900	378.2
New Japanese yen	418	0.900	374.4
Hong-Kong dollar	418	0.900	374.4
Franco-Asiatic	420	0.900	378.4

While the disfigured Mexican dollars are to be demonetized and recoined, the question will arise what amount of silver China will have to buy in the world's markets to complete her monetary system, and when the Chinese demand will have to be filled. At this point all remains uncertain. The coinage of a fractional coin of the same standard with the dollar itself is a novel and commendable feature, and in this respect nearly all nations have sinned hitherto, in spite of the fact that a base fractional silver coin is acknowledged to be a nuisance by all. If the new international silver dollar to be adopted by the congress of all American nations were to be made to conform to the Chinese standard and weight, and thus be capable of filling in Pacific intercourse the rank which the Mexican dollar has occupied and still holds to a certain extent, there would be the practical advantage, not to be underrated, of having a coin available for an enormous circulation in and out of the New World. There would be a market for it in New York, London and the Asiatic money centers.

#### Low-Grade Pig-Iron in Foundries.

It is interesting to note the change which the progress of the times is making in the pig-iron trade. One of the most remarkable is the utilization of low grades for foundry purposes. But a few years since it was a serious problem with the owners of a blast-furnace remote from rolling-mills what to do with the pig not classed as foundry iron which they would at times unavoidably produce. Mill or gray forge and mottled iron were scornfully rejected by the vast majority of foundrymen, because castings for general uses could not be made from those grades, which therefore had to be shipped long distances to rolling-mills or pipe foundries and seldom realized cost to the makers. This feature of the pig-iron trade was a hindrance to the development of the blast-furnace industry *per se* at such locations as Chicago, for instance, where the conditions have been constantly growing more favorable for the manufacture every year. A limited quantity of low-grade pig-iron could, of course, be absorbed by the local demand, but a very slight excess produced a glut which had to be worked off at considerable trouble. It was supposed that this condition of affairs would only be remedied by the establishment of pipe-works or rolling-mills in the vicinity of the furnaces. But the problem has been solved and a remedy found, and of late the demand from foundrymen has run so heavily to low-grade and consequently cheap pig-iron that the distinction which once existed between it and the so-called foundry grades bids fair to be almost obliterated. There are many Western furnaces which

now have on their books orders from foundrymen exclusively, covering their entire production of mill iron for months, while their foundry iron is neglected. This is, of course, due to the widespread use of ferro-silicon or high-silicon pig-iron as a mixture with the cheap low-grade iron, by which castings of as good quality are produced as if made from strictly foundry pig-iron. Even the mottled irons of the South, which have invariably been sold below cost to get them out of the way, are being hunted up, so far as such a phrase is applicable in the present depressed condition of the iron trade generally. Western consumers are seeking them because they know now how to use them to advantage in making a cheap mixture and yet secure castings that will prove satisfactory for the purposes intended. The innovation which has thus been made in foundry practice is an inestimable boon to furnacemen. It is not only very important to owners of furnaces located far from rolling-mills and pipe-works, but it seems to have developed just at the right time to open a new channel for the consumption of grades of pig-iron which would otherwise have heavily depreciated in value through the continuous displacement of puddled iron by steel.

The action of the anthracite coal roads in reducing the rates of anthracite coal to the mills and furnaces of their section, the Pittsburgh *Dispatch* remarks, looks like a practical confession of the assertion that the burden of excessive railroad rates levied upon the iron industry of Eastern Pennsylvania by the anthracite pool has been the cause of the failures in that industry.

#### The Blast-Furnaces on May 1.

The long-continued depression in the iron trade has at last begun to tell on the quantity being currently produced, a decline in the capacity of the coke and anthracite furnaces of over 4000 tons a week having taken place in April, in spite of the fact that three new furnaces made their first cast of iron in Alabama during the month. A further decline, notably in the anthracite furnaces, may be looked forward to as the result of the leveling down of prices at tidewater markets to the parity of Western values. It is probably not known generally that there are actually a number of furnaces still in blast east of the Alleghany Mountains whose monthly product ranges between 500 and 1000 tons, or less than any modern stack makes in a week. The majority of these antiquated plants must go and are likely to stop very soon.

On the 1st of the current month the status of the anthracite furnaces was as follows:

Anthracite Furnaces May 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	24	12	3,917	12	3,841
New Jersey.....	14	5	2,061	9	3,410
Spiegel.....	3	3	218	0	0
Pennsylvania:					
Lehigh Valley....	46	23	8,460	23	8,063
Spiegel.....	1	1	75	0	0
Schuylkill Valley..	32	19	6,882	13	3,841
U. S. Susquehanna Valley.....	17	9	3,184	8	1,293
Lebanon Valley....	16	13	6,498	3	1,233
L. S. Susquehanna Valley.....	21	10	4,020	11	2,788
Total.....	174	95	35,315	79	24,019

For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
May 1.....	85	35,315
April 1.....	102	37,977
March 1.....	103	37,967
February 1.....	107	39,187
January 1, 1899.....	107	38,728
December 1, 1898.....	99	34,879
November 1.....	95	33,645
October 1.....	95	33,728
September 1.....	92	33,541
August 1.....	93	33,807
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,008
April 1.....	94	30,496

Crown Point has been added to the furnaces at work in New York, having blown in on Bessemer on the 23d ult. In New Jersey the same five furnaces are running. Warren, however, as we are officially informed, will blow out on the 1st of June. In the Schuylkill Valley current capacity has been lessened by the stoppage of No. 1 Phoenix and Brooke No. 3 for repairs, and the blowing out of the two Reading stacks. One of the producers of the valley writes that he does not expect to blow in again in competition with Southern manufacturers until costs have been radically reduced. He states that it is a question of being able to make iron at \$18.50 per ton or abandon the business. In the Lehigh Valley the Allentown Iron Works are running only one furnace, but Bethlehem is now producing with three.

Danville, in the Upper Susquehanna, was banked on the 4th, and Irondale stopped on the 2d ult.; still, the large product of the five Lackawanna stacks went far toward compensating for this falling off, the April output having been 14,803 tons, against 16,138 tons in March for the same district. While we need note no changes in the Lower Susquehanna district, we may report an increase in the Lebanon Valley, through the blowing in of the second Bird Coleman early in April.

The month opened with the following capacity working:

Coke Furnaces May 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	3	1	1,127	2	2,350
Pennsylvania:					
Pittsburgh district.....	18	17	30,557	1	800
Spiegel.....	1	1	539	0	0
Shenango Valley.....	19	16	11,233	3	1,706
Junata and Conemaugh Valley.....	18	12	5,890	6	2,150
Spiegel.....	1	0	0	1	430
Youghl. Valley.....	5	4	1,622	1	790
Miscellaneous.....	4	4	2,336	0	0
Maryland.....	1	1	179	0	0
West Virginia.....	6	3	2,418	3	498
Ohio:					
Mahoning Valley..	14	11	8,413	3	2,025
Central and Northern.....	16	11	7,956	5	3,514
Hooking Valley....	14	4	1,299	10	3,345
Hanging Rock.....	13	8	1,320	5	1,210
Indiana.....	12	1	235	1	154
Illinois.....	12	7	8,070	5	3,925
Spiegel.....	1	1	468	0	0
Wisconsin.....	4	2	823	2	850
Missouri.....	6	2	1,094	4	2,218
Colorado.....	2	1	490	1	450
The South:					
Virginia.....	11	8	3,896	3	1,471
Kentucky.....	4	3	837	1	330
Alabama.....	26	19	12,119	7	3,421
Tennessee.....	11	9	4,332	2	790
Georgia.....	2	1	501	1	810
Total.....	214	147	98,399	67	31,465

As compared with previous months these figures stand as follows:

	No. of furnaces.	Capacity per week.
May 1.....	147	98,399
April 1.....	151	100,080
March 1.....	150	100,737
February 1.....	150	98,518
January 1, 1899.....	157	108,728
December 1, 1898.....	151	101,736
November 1.....	146	94,695
October 1.....	137	85,481
September 1.....	133	81,082
August 1.....	122	74,855
July 1.....	121	69,549

June 1.....	128	75,497
May 1.....	130	76,835
April 1.....	136	79,644
March 1.....	125	68,282
February 1.....	126	73,912
January 1.....	143	88,101

There is nothing of interest to report concerning the furnaces of the Pittsburgh district. Work is being pushed on the new stack of Laughlin & Co. and on the new furnaces of the Carrie Furnace Company, the first to be ready, if possible, on the 15th of June and the latter on the 1st of August. From the other coke districts of Pennsylvania there is nothing to report.

In the Hocking Valley, Baird, Bessie, Glasgow and Winona were the only plants producing, Fannie having gone out and New York having been banked on the 19th ult. The total product in April of the district was 8146 tons, against 8945 tons in March, aggregating the returns from every active plant. In Illinois the same furnaces are at work, their April product having been 36,569 tons, as compared with 35,904 tons in March, including Spiegel. In Wisconsin both of the Bay View stacks are turning out iron; on the other hand, however, Mayville stopped work in April. In Missouri two furnaces only are producing iron. Vigo, in Indiana, is to blow out this month, the plan being to rebuild and enlarge, so that the furnace is likely to remain idle until the fall. In the case of the three States last named we have official returns of product, upon which the capacity figures are based.

In the South April has been eventful. Three new furnaces, the second De Bardelieben, the Lady Ensley and the Trussville have resumed, so that now the number of active furnaces carried on the list is 26. A number of furnaces are out, however—the Bibb, Edwards, Gadsden, Mary Pratt, Sheffield, No. 2 Ensley and Williamson. The latter is to finish repairs at an early date, and has probably blown in before our report reaches our readers. Among the new furnaces completed or nearing completion are two at Sheffield, two at Florence and two at Anniston. In Georgia Rising Fawn resumed on the 29th ult.

## CORRESPONDENCE.

### The National Wire Gauge.

To the Editor: The number of differently-named gauges has long been a source of annoyance and vexation to both buyers and sellers of wire. From time to time manufacturers of wire, and sometimes even merchants, have had made for themselves individual gauges bearing their own or some fancied name. These various gauges have all been practically the same as to sizes and numbers, but differed entirely from the Brown & Sharpe American wire gauge or the Stubs gauge. Many disputes and much unpleasantness have resulted from the lack of a knowledge of this difference.

So great has this multiplicity of standards grown that to-day the specification of the number of a wire carries with it no knowledge of the size unless accompanied by a statement of the gauge used. Having suffered much annoyance from this chaotic condition of things and believing the time ripe for at least a partial correction, we have after a somewhat wide correspondence concluded to submit the following, since it is of interest to a large number of your readers:

All of the wire manufacturers of the United States, with the exception of a few firms, have expressed themselves in favor of adopting a universal name for the gauge which all use in common though under various designations. The majority having expressed themselves at the same time in favor of the name "National Wire Gauge," and the others agreeing to abide by the decision of the majority, all have

agreed in future—with the few exceptions alluded to—use the term "National Wire Gauge" in giving sizes of wire.

The following are the firms agreeing to the foregoing:

Cleveland Rolling Mill Company.  
American Wire Company.  
Oliver & Roberts Wire Company.  
Carnegie, Phipps & Co.  
Gautier Steel Department, Cambria Iron Company.  
St. Louis Wire Mill Company.  
Lambert & Bishop Wire Fence Company.  
Stewart & Co.  
Worcester Wire Company.  
Geo. W. Prentiss & Co.  
R. H. Wolff.  
H. Belmer & Co.  
Iowa Barb Wire Company.

We append a table of the adopted gauge, showing sizes and diameters from 7/0 to 36; also tables of diameters of American and Stubs' numbers corresponding:

National Wire Gauge.				Number.	Birmingham gauge (Stubs').	American, (Brown & Sharpe's) gauge.
Gauge numbers.	Diameter, inches.	Weight of 100 feet, Pounds.	Weight of one mile, Pounds.			
7/0	0.490	63.63	3360	...	...	...

Again calling attention to the fact that the National wire gauge differs materially from the Brown & Sharpe American wire gauge or Stubs gauge, we are very truly yours,

IOWA BARB WIRE CO.

98 READE STREET, NEW YORK CITY.

The Equitable Natural Gas Company, of Pittsburgh, are rapidly finishing their new pipe line from the Northern Murraysville gas field to Pittsburgh. This will be one of the largest lines in the country. The entire distance will be laid with 24-inch and 30-inch cast-iron pipe. The corporation has now a capital of \$1,000,000. Mr. R. B. Brown, one of the originators of the old Fuel Gas Company, of Allegheny County, is the president, Reuben Miller, of Miller, Metcalf & Parkin, is treasurer, and W. H. Aldred is secretary. Mr. W. D. Hartuppee is the engineer of the company. The primary object of the company's organization is to supply all the manufacturers along the Allegheny River. They own from 2000 to 3000 acres of first-rate gas territory in the Northern Murraysville field. The main line to the city will be ready by July 15, and it will take 15,000 tons of cast-iron to manufacture all the pipe required.

## The Paris Copper Conferences.

Story of the Boston Herald.

LONDON, May 3, 1889.—The copper conference at Paris has utterly failed to accomplish the purpose for which it was designed. It has failed to arrive at any agreement, written or verbal, and it has broken up without fixing a price. The American committee have left Paris in disgust, and will sail from Liverpool for New York to-morrow (Saturday) on the steamship Servia, and to-morrow, by the time this message is read by the public, copper will be put on the open market and sold for what it will bring. The crash of the Comptoir d'Escompte and the Société des Métaux left certain eminent financiers with enormous amounts of copper in their possession, as collateral for money advanced to the so-called syndicate engaged in the recent ill-advised and unfortunate speculation. The copper so held amounts to 175,000 tons, of which about 25,000 tons are held in London and the rest in Paris. The Paris holders of copper are the Bank of France, 60,000 tons, and Rothschilds, 40,000 tons. These two holders have dropped 30,000,000 francs, exclusive of interest, in this speculation. The Banque de Paris et des Pays Bas holds 20,000 tons; Baron Hirsch, 20,000 tons, and the Credit Foncier holds a large amount. It is understood that Baring Bros. are the largest English holders. Then come the Union Bank of London, the National Discount Company and C. J. Hambro & Son, also of London.

The problem has been how to dispose of this copper and get back the money advanced, reimburse losses, and still keep up good prices. In view of the fact that American and English owned mines have large stocks ready for market, to glut the market by unloading these 175,000 tons without in some way curtailing the output of the mines for a longer or shorter period meant ruin to many and serious loss to all concerned, from employers in mines and metal industries up to the great financiers. In order to prevent such disaster and to foster a consumption by fixing a moderate price, the owners of American copper mines sent confidential representatives to Paris to confer with the holders of the immense stocks now in hand. The Calumet and Hecla Mine was represented by Col. Thomas L. Livermore, of Boston; the Anaconda Mine by its sole owner, J. B. Haggin, the hundred-times millionaire of San Francisco; the Tamarack Mine and the Boston and Montana Mine, Mr. Lewisohn, of New York, while Mr. Gordon Abbott and Mr. Wheelock, of the firm of Jere Abbott & Co., represented the smaller mines.

These gentlemen sailed from New York on the steamer Umbria and arrived in Paris the latter part of March. The Frenchmen showed little inclination at first to attend meetings. The Rothschilds and the Bank of France people, in particular, held aloof, evidently thinking it *infra dig.* to comply with the request of the American committee. After the 1st of April there were daily meetings in their parlor, or to speak by the card, three and four meetings a day, without a satisfactory conclusion being reached. At these meetings 16 gentlemen were present, first the American committee, consisting of Colonel Livermore, Messrs. Haggin, Lewisohn, Abbott and Wheelock, and then the Europeans, comprising M. Secrétan, representing the Société des Métaux; M. Edmond Moreau and M. Minichcourt, the official liquidators of the Comptoir d'Escompte; Baron Rothschild, Baron Hirsch, two directors of the Bank of France, one director of the Banque de Paris et des Pays Bas, Mr. Doetsch, of London, man-

ager Rio Tinto Mine; Mr. Mason, of London, of Mason & Barry Mine, and Mr. Guthrie, of Balfour, Guthrie & Co., the well known English metal brokers.

Day after day in the parlor these gentlemen met and discussed the situation. There was so much discussion the Americans grew weary. The Frenchmen talked and talked, talked and talked, as Frenchmen will. They were profoundly courteous; it is their habit. They agreed something ought to be done, but did not agree how to do it. They expressed great surprise at the collapse of the copper syndicate and the fall of the copper market, and couldn't understand why all their nicely-laid plans went wrong. Then they adjourned for *dejeuner*, to meet again and go over the same old ground of argument and surprise; then they adjourned for light refreshment. In the middle of the afternoon they returned to talk it all over again, and then adjourned for dinner, only to come back and repeat the previous performances. A fortnight went in this way, the Americans clearly not disposed to assist in forming another copper syndicate or to play into the hands of the European speculators. The Europeans were anxious to get rid of the copper on hand, but couldn't advantageously without the assistance of the American committee. There was a muddle all round. Whenever a way seemed clear something turned up to block it, and it began to look as though no arrangement could be reached, until one day Mr. Haggin, who had watched the proceedings in silence, came forward and addressed the meeting.

When Mr. Haggin says anything he says it to the point in the fewest words. He is a middle-aged, white-haired, white-bearded man of great dignity, cold manner, remarkably clear head, and he is unsurpassed in uncommunicativeness. When he spoke, his deep voice, solemn manner and imperious face awed the French. He said: "Gentlemen, I have listened to this discussion several days. If I have been edified I have not been instructed. You do not seem to appreciate the situation. It is this: I mine copper to sell, not to keep it to look at. It costs me nothing to mine my copper. The silver extracted from my ore yields such a profit that my copper is practically a by-product. But suppose I say copper costs me 3 cents per pound, ready for delivery in bars, you will see I can sell it at a profit whether you agree on a price or not. The Calumet and Hecla copper is better than my own, but it does not cost its owner over 2 cents a pound more. The Calumet and Hecla mine and my mine, the Anaconda, produce at the present time 60,000 tons of copper annually, but neither of them works full capacity. The Calumet and Hecla has 13 shafts and works only three. If that concern add the Anaconda work full capacity they can supply the world with nearly three-fourths its annual consumption of copper. We who compose this American committee have crossed the Atlantic to confer with you and assist in relieving your difficulties—for the difficulties are yours, not ours—but we are prepared to make concessions, and to expect you to do likewise. As I mine copper to sell, I shall return to America within a few days and sell it; meanwhile, if we can make an arrangement, well and good; if not, I shall put my copper on the open market and sell for what it will bring, and you must be prepared for the consequences."

The effect produced by Haggin's speech, which astonished and startled the Parisians, appeared to change the old views for new and they prepared to come to a speedy settlement. Then Colonel Livermore drew up a proposition which the Bank of France directors recommended for acceptance. The proposition was in brief this: That the selling price of copper be fixed at £45 per ton; that a com-

mittee be appointed to determine what proportion of the 175,000 tons now in hand shall be regularly placed on the market, and what proportion of the future product from American and English owned mines, the mines agreeing to curtail their output accordingly; this agreement to hold for six months, at the end of which time it could be renewed if it proved satisfactory, and if not satisfactory the parties concerned to meet again and make whatever arrangements necessary. This proposition was accepted and ordered to be engrossed for signatures. The Frenchmen desired that, when engrossed, the document be sent to the Barings in London to secure the English signatures, and then be returned to Paris for the French signatures. This desire was agreed to, and the meetings at the Hotel de l'Athenée dissolved, everybody supposing, at any rate the Americans, the matter settled. The Americans went to London to await the arrival of the engrossed agreement. It is well to add at this stage of the narration that the American committee considered the agreement fair to all concerned. It is within my knowledge that before the committee left New York certain capitalists, themselves large owners in the smaller mines, had expressed the wish that the Paris conference should fix the price at not less than £80 per ton, but the committee desired to open the New York copper market, and, while easing it, to make it steady. Everywhere in Europe the consumption of copper has seriously fallen off owing to the excessive prices forced by the late syndicate. In many places engineers are striving to find a substitute for copper. Naturally the American committee desired to take steps restoring public confidence and renewing the demand for copper, which could be done only by fixing an easy price and so regulating the new output and disposal of the present immense stock that the market should not be glutted, making a grievous fall in rates, which only a long period would set right again, and which might possibly precipitate a panic. The Frenchmen wanted as big a price as possible. Livermore proposed £40, but the Parisians would listen to nothing under £45, and even then an arrangement would mean four or five years before the present 175,000 tons can be worked off and past losses made up. They were disposed to no agreement until the Americans displayed the whip hand and declared themselves masters of the situation. Mr. Haggin told them in effect: Here is the proposition; take it up or drop it, as you choose. If you take it up, all right—you can realize on your holdings; if you drop it we shall leave Paris and shall not return, and you can make no arrangements with us. We can put copper on the market at terms impossible for you to deal with excepting at heavy loss. Mr. Haggin is an immovable man, with an experience of the world almost as vast as his wealth.

I have said that the American committee returned to London to await the arrival of the engrossed agreement. They waited days and they waited in vain. No document came. There was a hitch somewhere. No satisfactory explanations being obtained, Mr. Wheelock concluded that nothing could be done, and went to Sweden. Where was the mysterious hitch? It was suspected that Doetsch, of the Rio Tinto, knew more about it than anybody else. He was interviewed, and said he had changed his mind and intended to sue the directors of the bankrupt société and the comptoir, and meanwhile could not become a party to the agreement. Then the Frenchmen refused signing if Doetsch held off. In these circumstances the Americans could do nothing, and did not propose holding an umbrella over Rio Tinto while others stayed in out of the

rain. Doetsch's explanation was not satisfactory. The hitch was peculiar, to say the least. Meanwhile Rio Tinto shares went up and down on the stock exchange as though somebody found manipulating them profitable, but not with respect to the shareholders. The Americans interviewed Doetsch again. They found he had undergone another change of mind, and had decided on abandoning legal proceedings against the directors of the defunct société and the comptoir. He said he was ready to sign the agreement, but the agreement did not come. Colonel Livermore and Mr. Haggin decided to return to Paris. The last of April was approaching, and they told Doetsch they would sail for America on Wednesday, the 1st of May. Meanwhile they would go to Paris and put the matters through or leave them where they stood. Doetsch suddenly discovered he could not go to Paris before Thursday, the 2d of May. Colonel Livermore and Mr. Haggin decided they had had enough of trifling and delay, and started for Paris, and arrived there Friday evening, April 26. Wheelock still was in Sweden. Lewisohn, thinking it hopeless, remained in London. However, the Calumet and Hecla and Anaconda representatives were sufficient to put things through at this stage of the negotiations if things could be put through at all.

On Saturday morning Colonel Livermore and Mr. Haggin went to the Rothschilds' place in Rue Lafitte, meeting there the Barons Alphonse, Gustave and Edmond de Rothschild, all of whom appeared eager to arrange on the basis previously proposed, even going so far as to suggest putting the pressure, whatever that might mean, on Doetsch, and bringing him to Paris to sign. The two committeemen returned to the Hotel Athenée about noon. M. Moreau, liquidator of the comptoir, called upon them. He had no sooner departed than the three Rothschilds, with exact regard for etiquette, left their cards. Then Saturday passed, and Sunday and Monday, but no decision and no Doetsch. M. Goldschmidt, who is said to have \$500,000 in a Montana copper mine, but who has really sold out, as I am credibly informed, called and inquired: "Do you gentlemen intend returning to America before an arrangement is made?" The reply was: "No arrangement has yet been made, and all the American committee will sail on the Servia Saturday, May 4." It had been found advisable to sail Saturday instead of Wednesday. Imperturbable Mr. Haggin calmly declared: "I shall leave Paris for London on the 11.15 train to-morrow morning." He was as good as his word. Tuesday morning he went to London, leaving Colonel Livermore in charge of affairs. The Colonel arranged for a meeting Wednesday, declaring absolutely that he should leave Paris after that agreement. As no agreement was made in the latter case nothing could induce the American committee to return to Paris or delay the date of sailing for New York. European copper holders having made their bed must lie in it. On Wednesday refractory Doetsch appeared in Paris. Whether or no the Rothschilds had put a pressure upon him is matter for surmise; at any rate, no amount of pressure induced him to agree with what appeared to be the opinions of the other gentlemen. He insisted, for one thing, that the American mines should send only 20 per cent. of their surplus copper to Europe. It was manifestly impossible for Colonel Livermore to agree to this, and after further unprofitable discussion adjournment was made till Thursday. On Thursday Doetsch was as strangely obstinate as ever, and Colonel Livermore declared further discussion useless, and left the meeting and arranged to leave Paris the following morning (to-day) by the 9.40 train for London. This morning while he

was dressing the Frenchmen called and asked him to meet them, and a final conference was held about an hour before the departure of the train, but to no purpose. Colonel Livermore reached London this evening, and, with the other members of the American committee, left for Liverpool to-night by the midnight train, and will embark on the Servia in the morning. The committee did all they could to effect an amicable settlement. Doetsch was the stumbling block. The other Europeans profess to be angry with Doetsch. Perhaps they are. At any rate, something will crash before long.

## OBITUARY.

WILLIAM H. BARNUM.

The *Bulletin* of the American Iron and Steel Association prints the following sketch of the life of William H. Barnum, who died at his residence at Lime Rock, Conn., on Tuesday morning, April 30, 1889. Mr. Barnum had been confined to his bed only two or three days, but for the preceding 48 hours his death had been expected momentarily.

William H. Barnum was born in Boston Corners, N. Y., on September 17, 1818. He received a public school education of a substantial kind. His father, originally a farmer, established the first iron foundry at Lime Rock, Conn., and all his life William H. Barnum was extensively engaged there and in the neighborhood in the manufacture of pig-iron and car-wheels. Many years ago he became interested in iron ore mines in the Lake Superior region. He was successful as a business man, and accumulated a fortune. He figured prominently in Connecticut politics for many years. In 1851 and 1852 he was a member of the State Legislature, and since 1868 he had been a delegate to every Democratic National Convention. Since 1872 he had been a member of the Democratic National Executive Committee, and for some years was its chairman. He was elected to the Fortieth Congress in 1865, when he ran against his cousin, P. T. Barnum (Rep.), the showman, and was re-elected to the Forty-first, Forty-second, Forty-third and Forty-fourth Congresses. He served from March, 1867, until May, 1876, when he resigned to take a seat in the United States Senate, having been elected to fill the vacancy caused by the death of Orris S. Ferry (Rep.). His term expired in March, 1879, when he was succeeded by Orville H. Platt (Rep.). He has been, however, most prominent as chairman of the Democratic National Committee, a position which he held continuously from 1877 until his death.

In the foregoing condensed account of the leading events in the life of Mr. Barnum his prominence as an iron manufacturer has been briefly referred to. He was one of the most enterprising and successful iron manufacturers the country has ever known. Early in his life he engaged in the manufacture of charcoal pig-iron in the celebrated Salisbury district of Connecticut. At the time of his death he was either sole or part owner of seven charcoal furnaces in Litchfield County, Conn.; three charcoal furnaces in Berkshire County, Mass., and one charcoal furnace in Dutchess County, N. Y.—in all 11 furnaces, all operated with charcoal and all using Salisbury ore or ore of the same characteristics. The pig-iron produced from Salisbury ore is admirably adapted to the manufacture of car-wheels, and it was this quality which led Mr. Barnum to combine the business of manufacturing pig-iron with that of manufacturing car-wheels. His operations, however, were not confined to the localities above mentioned. He was at one

time engaged in the manufacture of car-wheels in Chicago, and he was also a large owner of the Barnum iron-ore mine in the Lake Superior region.

#### FREDERICK LUNKENHEIMER.

The business community lost an able man in the death of Mr. Frederick Lunkenheimer, the late president and general manager of the Lunkenheimer Brass Mfg. Company, of Cincinnati, Ohio. He was born in the province of Rhine-Hessen, Germany, October 24, 1825. In Mayence, at the age of 14, he served as an apprentice in a mechanic's establishment for three years, and the subsequent three years as a journeyman. He arrived in New York in 1845. He there found employment in the establishment of the Morse Telegraph Company, where he was put to work upon the first telegraph instrument made in this country. After spending five years in New York and becoming conversant with the English language he went to St. Louis, Mo. The next important event of his life was his trip to New Orleans, La. At this time the yellow fever was raging, and he was one of the many who were taken seriously ill and given up to die, but fortunately he recovered, and then started for New York by way of the Mississippi and Ohio rivers. On his way he was robbed of all his funds, which was the cause of his remaining in Cincinnati. In October, 1862, he began a business of his own, of course small at first, his entire force of workmen consisting of himself and one apprentice. It gradually expanded until the present concern gives employment to 150 men.

The business of the company will be continued as heretofore under the management of his sons, in behalf of the stockholders of the company, who are the members of the family of the deceased.

#### Obituary Notes.

Samuel Orchard, manager of the Newton Copper Type Company, of No. 14 Frankfort street, died on the 2d inst. He was a native of England, having been born in Bridgewater on January 1, 1816. He came to this country when 18 years old, and engaged in the drug business in New York. In 1851 he founded, with Dr. Newton, the Newton Copper Type Company, becoming its manager and secretary, and retaining his connection with it until his death.

On the night of the 8d inst. Hugh McDonald, well known in Pittsburgh as patentee of the furnace shield bearing his name, and which is used quite extensively in the mills throughout the country, was found dead in bed in one of the hotels of that city.

John Kennedy, a prominent stockholder of the Illinois Iron and Bolt Company, died at Chicago on the 25th ult. He was born in Pittsburgh in 1825 and settled in Chicago in 1850. He began the manufacture of elevators and hoisting machinery in 1853, continuing in that business until 1888, when he began to take an active interest in the affairs of the Illinois Iron and Bolt Company, of which he had been one of the original stockholders and for many years a member of the board of directors.

Frederick A. P. Barnard, after more than 25 years' service as president of Columbia College and more than half a century's work as instructor in various institutions, is dead at the age of fourscore years. President Barnard was born in Sheffield, Mass., in 1809, and his life was spent in educational work. He graduated from Yale with high honors when 17 years of age, and began his teaching a year later as tutor in the college. Besides his work as instructor, President Barnard

was a well-known writer on scientific subjects and the author of several works of decided practical utility.

## Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., May 7, 1889.

The Chief Constructor of the Navy has a large corps of experts engaged in preparing the plans for the additional vessels of war authorized by Congress. This will embrace cruisers Nos. 9, 10 and 11, each of 2000 tons displacement. The advertisements for the vessels will be made public during the present week. It is hoped that the contracts may be awarded so that the work may be commenced before fall.

The greatest disappointment is expressed in naval circles that the appropriation by Congress for the coast-defense vessel was not sufficient to include the submarine torpedo-boat which was authorized under the same appropriation. The award of the coast-defense vessel was made to the Union Iron Works, of San Francisco, although the bid was higher than that of the Cramps, on account of the acceptance of the specifications of the Department in regard to boilers without question. The figures of the contracts for the vessels were as follows:

Chas. Cramp & Sons, Philadelphia, \$1,614,000, with exceptions.  
Union Iron Works, San Francisco, \$1,628,000, without exceptions.  
Quintard Works, New York, \$1,690,000, without exceptions.

The Cramps were not disposed to make any modifications and give a guarantee of that which they were doubtful of their ability to perform. The Pacific-Coast people made no exceptions. It now remains to be seen whether they will be able to give the results which the Cramps claim cannot be obtained as required by the Department. There has been considerable controversy in engineering circles as to the machinery of the Charleston and the Vesuvius. The former vessel guarantees 7000 horse-power, with weight of machinery limited to 620 tons. The machinery of the Vesuvius, including engines and boilers, weighs 246 tons and has developed 4450 horse-power. There appears great rivalry between the East and West on the subject of naval machinery, the result of which it is thought will prove beneficial in the way of improvements. The working plans of the coast-defense vessel which have been prepared by the Bureau of Construction are the most complete which have been prepared for the construction of a vessel by any government. The sheets number over 80, and give a view of every position and detail of the monster engine of war.

It is stated on good authority that William Weihe, for the past six years president of the Amalgamated Association of Iron and Steel Workers, of Pittsburgh, has decided not to be a candidate for reelection at the coming annual convention of the organization, and will retire to engage in business pursuits. Efforts have been made by members of the association to induce James H. Nutt, of Youngstown, to allow his name to be used as a candidate in the event of President Weihe retiring, but he has declined by reason of having been tendered a lucrative appointment in the employ of the Government. As the salary of the president of the Amalgamated Association is \$1500 per year and traveling expenses, it is probable that each district will have one or more candidates.

It is reported that a fire is raging in the Aurora Mine, on the Gogebic range. It is one of the large producers of the district.

## PERSONAL.

W. H. Borntraeger, manager of the Seventy-ninth street mills of Carnegie, Phipps & Co., Limited, at Pittsburgh, sailed for Europe on the 4th inst., accompanied by his wife and family, for an extended pleasure trip.

Mr. J. A. Nichols, the well-known president of the Pittsburgh Bridge Company, of Pittsburgh, was presented by his employees with a handsome reclining chair on Saturday, the 27th ult. In a speech thanking the men for their kindness, Mr. Nichols related how he had entered the employ of the firm at \$1.50 per day until he had risen to be president of the company.

At the annual meeting of the Chester Rolling Mills, Thurlow, Pa., the following officers were elected: S. A. Crozer, president; S. A. Crozer, Jr., vice-president and treasurer; Richard Peters, Jr., secretary, and C. B. Houston, general manager.

T. J. Houston, the former general manager of the Chester Rolling Mills, Thurlow, Pa., has accepted a similar post with the Crozer Steel and Iron Company, Roanoke, Va.

R. H. Lewis, president of the Chicago Furnace Company and vice president and general manager of the Calumet Iron and Steel Company, of Chicago, resigned both of those positions on the 1st inst. He continues to hold the vice-presidency of both the Chicago Drop Forge and Foundry Company and the Milwaukee Furnace Company and the presidency of the National Coke and Fuel Company. He is also a member of the executive committee of the National Storage Company, of Chicago, of which he was one of the originators. Mr. Lewis has managed the business of the Calumet Iron and Steel Company since January, 1886, to the entire satisfaction of the owners, who regret the severance of the relationship. He had previously been connected with the Lake Erie Iron Company, of Cleveland, Park, Bro. & Co., of Pittsburgh, and other iron and steel establishments. In view of his executive ability and his thorough knowledge of the iron and steel business he has received flattering offers from several sources since his retirement from the Calumet Iron and Steel Company has been made public, but he proposes to devote some time to the settlement of his private affairs before seriously considering their respective merits.

President Woodward, of the Hanover National Bank, with C. C. Baldwin and Col. Daniel S. Lamont, are to make up a Southern party. They go to Birmingham, Ala.

A party of Chicago and Boston capitalists will accompany O. W. Potter, of the Illinois Steel Company, Chicago, to visit the tin mines of the Black Hills, Dakota.

Wm. L. Abbott, of Carnegie, Phipps & Co., Pittsburgh, has been elected an associate member of the American Society of Civil Engineers.

Among the Americans proposed for membership in the Iron and Steel Institute, now in session in London, are Harmer Adler, of Chicago, G. T. Barns, of Philadelphia, F. Lynwood Garrison, of Philadelphia, Gustavus Henning, of Stamford, Conn., Andrew S. McCreath, of Harrisburg, and Stuart Wood, of Philadelphia.

Harry W. Oliver, of the firm of Oliver Bros. & Phillips, of Pittsburgh, has been elected president of the Pittsburgh and Western Railroad, to succeed James Callery, recently deceased.

# TRADE REPORT.

## Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,  
PHILADELPHIA, Pa., May 7, 1889.

**Pig-Iron.**—The market is somewhat unsettled, and on the whole prices have not been fully maintained. This is largely due to the anticipated action of the Thomas Iron Company, which materialized on Monday in the announcement of \$15, \$15.50 and \$16.50 as their quotations for the three grades of Iron, delivered at tide. Of course the general market is not \$1.50 per ton lower because of the Thomas company's reduction, as this action had been anticipated for some time past, and prices shaded accordingly. Sales have been recently made at from \$14.65 to \$14.75 for Gray Forge delivered in consumers' yards; \$16 for No. 2, and about \$17.50 for No. 1. Per contra, a few choice brands have been marketed somewhat freely at \$15 for Forge, \$16.50 @ \$17 for No. 2 and \$18 @ \$19.50 for No. 1, which are, of course, extreme figures, as also were those first mentioned. It is hard to say what may be the ruling figures two or three weeks later on, but the impression is that the Thomas Iron Company's action has been fully discounted, and that in the absence of further unfavorable developments the prices quoted by that company will be the minimum for all good Irons. Quite a number of furnaces are blowing out, or preparing to do so, on account of the unprofitable condition of business, so that if the demand continues as large as seems probable a reaction in prices would not at all surprise the trade. Of course there is the midsummer shrinkage in consumption to be taken into account, and a good deal will depend upon what length of time the mills take for repairs, holidays, &c. There are several other contingencies to be considered also, and until these can be estimated with a fair degree of exactness it is hardly likely that any special movement will be started in Pig-Iron. It is taken for granted, however, that the lowest figures of the entire year will be those dating from the middle of April to July, or probably August, and that after that date the market will be on the up-grade. The great difficulty is to define the exact position of the market today, because a price which one may accept is quite likely to be an entirely different figure from that which another would require. There are differences in quality, differences in judgment as to quality, differences in deliveries, differences in the financial standing of buyers, as well as differences in the financial position of sellers, and these are important considerations in times like these in determining what price should be accepted, or paid, for a particular class of Iron. The range, however, seems to be from \$14.75 to \$15.25, delivered, for Gray Forge; \$16 @ \$17 for No. 2 Foundry; and \$17 @ \$18.50 for No. 1, with a gradual recession from the higher figure to those of a medium or inside character. What the eventual course of the market is to be is still a matter of conjecture, although, as we have already stated, present prices are believed to be bottom prices, and not likely to be continued for any great length of time.

**Blooms.**—There is a tolerably fair movement in Steel Blooms, but some irregularity in prices is noted; and occasionally concessions have been allowed, so as to secure desirable orders. General quotations, however, are about as follows: \$28 @ \$28.50, at mill, for Nail Slabs; \$29 @ \$30 for Sheet-Iron Billets; \$30 @ \$31 for Soft Tank, and \$35 @ \$36 for Flange purposes; Charcoal Blooms, \$52 @

\$54; Run-out Anthracite, \$41 @ \$42.50; Scrap Blooms, \$32 @ \$33 per "Bloom" ton of 2464 lb.

**Muck-Bars.**—Prices are again firmer, and while \$27, delivered, is about as high as was realized during the past week, many holders now ask a shade over \$27, and in most cases would probably refuse less than that. The feeling is feverish and unsettled, in anticipation of higher prices in the near future.

**Bar-Iron.**—The feeling is a shade steadier, but the demand is not by any means what could be desired or expected under existing conditions. There is a disposition to ask more money—say about half a tenth—on the general run of orders, while for deliveries after next month a full tenth advance would be required, although as yet buyers have not shown any desire to contract for large lots. Still, it is believed that prices have seen their lowest for the current year, and that whatever changes may occur will be in the direction of improvement. The asking rates are from 1.75¢ to 1.85¢ for best refined Bars, although, of course, cutting in extras or other concessions is still largely indulged in. There is some talk of a renewed demand for Skelp Iron. Western mills are all full of orders, and directly or indirectly it is probable that Eastern mills will begin to feel its effects before long.

**Plate and Tank Material.**—There is a fair demand for Plates, and all the mills are tolerably well filled up with work for the next 30 or 40 days. There is nothing specially new on the market, but of late every week seems to bring enough work to offset the week's deliveries. Manufacturers are feeling their way carefully for a slight advance in prices, and while very little has been realized as yet, the position of the market is indicated by the fact that sellers are figuring in that direction. Meanwhile nominal quotations are about as follows: 1.90¢ @ 2¢ for Ordinary Plates and Tank Plates; 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.8¢ @ 3.4¢; Fire-Box, 3.5¢ @ 3.7¢; Steel Plates, Tank and Ship Plate, 2.1¢ @ 2.25¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 3½¢.

**Structural Material.**—Nothing large has been taken during the past week, but mills are very well supplied with work for the present, so that the feeling is somewhat cheerful, as there is a great deal of business to come on the market before long. When the mills are running full (as at present) they can afford to wait developments, as there is no doubt that large accessions will be made to their order-books during the summer months. Prices have not changed recently and the usual asking rates are nominally as follows: Bridge Plate, 1.95¢ @ 2.05¢; Angles, 1.95¢ @ 2¢; Tees, 2.4¢ @ 2.6¢; Beams and Channels, 2.8¢ for Iron or Steel.

**Sheet Iron.**—The demand has been rather heavy, and mills have accumulated quite a liberal supply of orders during the past couple of weeks. Some have nearly three months' work on hand, and as these are also filling up prices are held with considerable firmness, although in the meanwhile quotations continue as before, viz.:

Best Refined, Nos. 14 to 20.....	3¢
Best Refined, Nos. 21 to 24.....	3.20¢
Best Refined, Nos. 25 to 26.....	3.40¢
Best Refined, No. 27.....	3.50¢
Best Refined, No. 28.....	3.60¢
Common, ½¢ less than the above.	
Best Soft Steel, Nos. 14 to 20.....	3¼¢
Best Soft Steel, Nos. 21 to 24.....	3½¢
Best Soft Steel, Nos. 25 to 26.....	3¾¢
Best Soft Steel, No. 27.....	4¢
Best Bloom Sheets, ½¢ extra over the above prices.	
Best Bloom, Galvanized, discount.....	.65 %
Common, discount.....	.67½ %

**Steel Rails.**—The market is very much unsettled by reports of further cuts made by the Pittsburgh manufacturers. In this vicinity sellers are not inclined to change their position, and still quote from \$27.50 to \$28, f.o.b. cars at mill, although of course they are not entering much business at those prices. The disposition is to wait for further news from the storm center.

**Old Rails.**—No business whatever in this vicinity, so that prices are entirely nominal at about \$22 bid to \$23 asked.

**Old Car-Wheels.**—The Baltimore and Ohio Company report having sold 2000 tons at \$19, although that figure is very much beyond buyers' ideas in this market.

**Scrap-Iron.**—More inquiry, but prices are unsettled, although nominally unchanged, as follows: \$20 @ \$21 for cargo lots; \$21 @ \$21.50 for carload lots, delivered, or for choice, \$22; No. 2 do., \$14 @ \$15; Turnings, \$14 @ \$15; Old Steel Rails, \$18 @ \$19; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$28 @ \$24; Old Car-Wheels, nominal, \$17 @ \$18, Philadelphia.

**Wrought-Iron Pipe.**—There is a good demand for Pipe, and prices are well maintained. Discounts are about as follows: Butt-Welded Black, 55 %; Lap-Welded Black, 65 %; Butt-Welded Galvanized, 45 %; Lap-Welded Galvanized, 55 %; Boiler Tubes, 62½ %.

**Nails.**—There is a considerable demand for Nails, but no general improvement in prices. Quotations remain at \$1.90 @ \$2 for store lots, and \$1.80 @ \$1.85 for carload lots, but prices are irregular, and in some cases very low figures have been accepted for large lots.

E. D. Smith & Co. have removed their office to 208 South Fourth street, where they have much greater facilities for conducting their increasing business than at their former place.

Wm. R. Hart & Co. have been appointed general agents for the Spiral Weld Tube Company. E. Coit, formerly president of the Reading Iron Works, has recently become associated with Wm. R. Hart & Co., and will give special attention to that portion of the firm's business.

L. & R. Wister & Co., of Philadelphia, have taken the agency for the Tuscawas Pig-Iron made at Canal Dover, Ohio, by the Penn Iron and Coal Company. It is what is known as the American Scotch, being made of a large mixture of Black-band Ore. They have taken the agency for the territory embracing New Jersey, Pennsylvania, Delaware and Maryland.

## Chicago.

Office of *The Iron Age*, 59 Dearborn street,  
CHICAGO, May 6, 1889.

The increased earnings reported by railroad companies are eagerly seized as evidences of returning prosperity, but thus far no signs are apparent of a disposition among them to purchase supplies more liberally. Cautious business men are not disposed to bank very heavily on the reports of an improvement in the railroad situation, fearing that it is too late in the year to expect much relief in that quarter. Yet a better feeling is perceptible in some branches of trade, and the prospects of an early improvement in the demand are brightening. Consumers of Bar-Iron and Steel are urging quick deliveries on their small purchases, clearly showing that they have very light stocks, and inquiries are more abundant. Orders for fall delivery would be placed rather freely if the mills were disposed to take them at present prices. On immediate business the situation is unchanged, the demand being light and prices wretchedly low.

**Pig-Iron.**—While more local Coke Iron is being sold than any other kind, the volume of business is very small, consisting almost entirely of carload orders. Quotations are nominally unchanged, but a very weak feeling pervades the market, and it is believed that prices are off an average of 25¢ per ton as compared with the previous week. Small quantities of Lake Superior Charcoal have been sold at old rates, but large buyers are still holding off, although they are doing a great deal of talking to discover the true position of the manufacturers with regard to season contracts, the time for placing them drawing near rapidly. Cash quotations are as follows, f.o.b. Chicago: Local Coke Iron, No. 1, \$16; No. 2, \$15; No. 3, \$14; Chicago and Bay View Scotch, \$16.50; Lake Superior Charcoal, \$19; American Scotch (Blackband), No. 1, \$18 @ \$18.50; Southern Coke, No. 1 Foundry, \$16; No. 2 Foundry and No. 1 Soft, \$15.50; No. 3 Foundry, \$15; Gray Forge and No. 2 Soft, \$14.25; Tennessee Charcoal, No. 1, \$19; No. 2, \$18; ditto, lower grade, No. 1, \$17; No. 2, \$16; Alabama Car-Wheel, \$25.25.

**Bar-Iron.**—Sales have been quite light during the past week, but inquiries are more numerous. Hopes of an early improvement in this branch of trade have been aroused by the efforts of some heavy buyers to place orders for late summer and fall delivery. Manufacturers, however, are endeavoring to establish a higher price on business of this character, and thus far have been unable to make buyers meet their views. Stocks are very light in consumers' hands, as they insist on very prompt deliveries of the small orders which they are placing. Mill lots of Common Iron are quoted at 1.60¢ @ 1.65¢, half extras, f.o.b. Chicago, the valley mills pretty generally naming 1.50¢ at mill. Small lots from store are selling at 1.75¢ @ 2¢, according to quantity and quality, with buyers disposed to discriminate in favor of best grades.

**Structural Iron.**—The demand is still of a retail character. Carload lots from mill are quoted as follows, f.o.b. Chicago: Universal Plates, 2.15¢ @ 2.20¢; Angles, 2.10¢ @ 2.15¢; Tees, 2.50¢ @ 2.55¢; Beams and Channels, 2.90¢. Angles from store are held at 2.25¢ @ 2.30¢; Tees, 2.65¢ @ 2.70¢; Beams, 3.4¢.

**Plates, Tubes, &c.**—The boiler-makers are still suffering from a dearth of work, making the city demand for Plates exceedingly light, but the country trade is fair. Prices are firm, a slight advance having been made on Heavy Sheets from mill, but quotations from store are unchanged, as follows: Nos. 10 to 14 Iron Sheets, 2.50¢ @ 2.60¢; Nos. 10 to 14 Steel Sheets, 2.75¢ @ 3¢; Tank Iron, 2.40¢ @ 2.50¢; Tank Steel, 2.50¢ @ 2.60¢; Shell Iron or Steel, 3¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.50¢; Ulster Iron, 3.75¢; Boiler Rivets, 3.75¢ @ 4.25¢; Boiler Tubes, 65 % off for 3-inch and over, 62½ % off for 2 to 2½ inch, and 57½ % off for 1½-inch and smaller.

**Sheet Iron.**—Orders for Black Sheets for fall delivery are still in the market and mill prices are firmer, the manufacturers most eager for contracts having well covered their capacity. Prices may now be quoted at \$2.80 @ \$2.85 at mill for No. 27 of fair quality; guaranteed to corrugate commands 15¢ per 100, or \$3 per ton, more. Store lots of No. 27 Common are available at \$3.10 @ \$3.30, according to quality.

**Galvanized Iron.**—Manufacturers' agents have had a moderate trade from warehouse, but heavy orders were rare. Prices are still very low, small lots of Juniata being quoted at 65 % off and Charcoal 65 and 2½ % off, with concessions to best buyers.

**Merchant Steel.**—A few good-sized orders for Spring and Agricultural Steels were placed during the week, and there was a fair demand for small lots. Quotations are unchanged, as follows: Soft Steel Bars, 2.20¢ rates; Tool Steel, 7.75¢ @ 8¢; Specials, 12¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢; Sheet Steel, 7¢, 8¢ and 10¢; Tire Steel, 2.20¢ @ 2.25¢.

**Steel Rails.**—Small orders are being received in encouraging quantity and inquiries are numerous, but no heavy transactions have recently occurred in this market. The Joliet works started up on Soft Steel Billets and Wire Rods on the 1st inst., and will be turned on Rails at an early day. Standard Rails are quoted at \$29.50 @ \$30.

**Track Supplies.**—The demand is still quite limited, with quotations as follows: Steel Fish-Plates, 1.80¢ @ 1.90¢; Iron Fish-Plates, 1.70¢ @ 1.75¢; Bolts with Square Nuts, 2.55¢; Bolts with Hexagon Nuts, 2.65¢; Spikes, 1.95¢ @ 2¢.

**Old Rails and Wheels.**—On the basis of sales recently made at Milwaukee Old Iron Rails are worth about \$19 @ \$19.50 here. Prices have for some time been too high for business with the Mahoning Valley, the mills of that section having been able to supply their requirements at lower figures in other directions. Old Steel Rails are quoted at \$14 for short lengths and \$18.50 for selected. Small sales of Old Car-Wheels have been made at \$17, and stocks continue to accumulate.

**Scrap.**—An abundance of Old Material is being offered by railroads and machine shops, but consumers are not taking hold. Small sales are occasionally made to them, but the bulk of transactions is with dealers who are stocking up heavily at low cost. They quote as follows to consumers per ton of 2000 lb: No. 1 Wrought, \$17.50 @ \$18; Track, \$18; Axles, \$23; Horse-shoes, \$18; No. 1 Mill, \$13; Cast Machinery, \$12; Stove Plates, \$9; Cast Borings, \$8; Wrought Turnings, \$11; Axle Turnings, \$12.75; Mixed Steel, \$10.50 @ \$11; Coil Steel, \$13.50; Leaf Steel, \$15.

**General Hardware.**—The situation has again changed with respect to Shelf Hardware, and business is now very active. The month of May opened with a rush which had hardly been anticipated, although it was earnestly desired. Heavy Hardware is quiet, mainly on account of the limited demand for Iron and Steel, a fair trade progressing in Wagon Stock.

**Nails.**—Manufacturers' agents report a moderate inquiry for Steel Cut Nails from country merchants, who are submitting specifications for deliveries in the next 80 to 60 days. Stocks are light in their hands, but they are buying cautiously for fear of prices going lower. The indications are strongly in favor of greatly increased business in this line before the close of the month. Jobbers are doing very well. They quote small lots of Steel Nails at \$1.95 @ \$2 and Wire Nails at \$2.35 @ \$2.40, with the usual reduction for mixed carloads.

**Barb Wire.**—The situation is unchanged. With a very active demand, both on manufacturers and jobbers, small lots of Painted are sold at 2.75¢ @ 2.80¢ and Galvanized at 3.35¢ @ 3.40¢.

**Tin-Plates.**—Prices are a little higher on account of a growing scarcity. An advance of 25¢ per box has been made on regular sizes of Bright Plates and of 50¢ on Roofing-Plates.

**Pig-Lead.**—This market has been quite active for the past two weeks, owing to the demand for spot Metal to bridge over arrivals of contract Lead. The total sales in the time mentioned covered some 1200 tons, mainly at 3.47½¢, with some lots at higher figures. At present 3.50¢ is asked.

Russell & Roberts, manufacturers of castings at Paulina street and Blue Island avenue, Chicago, dissolved partnership on the 1st inst. The business will be continued by Francis E. Roberts.

F. W. Barker & Co., manufacturers of Architectural Iron-Work, have removed their city office to room 1050 in the Rookery Building, Chicago.

A. Schroder, broker in Iron, Steel, Old Rails, &c., has removed his office to room 825 in the Insurance Exchange Building, 218 La Salle street, Chicago.

Charles Himrod & Co., Room 518, Rookery Building, Chicago, have been appointed sales agents for the entire product of Merchant-Bar Iron and Nails manufactured by the Calumet Iron and Steel Company. F. G. Holton, who has for many years served the company as general agent, will continue to act in that capacity. Messrs. Himrod & Co. are well known in Western trade circles as dealers in Pig-Iron, Coal and Coke, and the reputation which they have established in those lines is an indication of their success in making this new departure. All correspondence in relation to purchases of the products of the Calumet Iron and Steel Company is to be directed to them.

John McLauchlan, Western manager for the Andrews Bros. Company, of Haselton, Ohio, manufacturers of Pig, Bar and Sheet Iron and miners of Coal, has removed his office to Rooms 301 and 302 at 59 Dearborn street, Chicago.

Jones & Laughlins, Limited, have been appointed exclusive Chicago agents for the sale of the Railroad Spikes manufactured by Dilworth, Porter & Co., of Pittsburgh. They will keep on hand at all times a large stock of these Spikes in their warehouse at Lake and Canal streets.

D. Forsythe Morris, Western manager for Milliken & Co., of New York, and the Phoenix Iron Company, of Philadelphia, has removed his office to Rooms 407 and 408 at 59 Dearborn street, Chicago. The Phoenix Iron Company are now manufacturing all sizes of Open-Hearth Steel Beams and making prompt shipments.

## Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, May 6, 1889.

**Manufactured Iron.**—The mills and foundries in this section are doing very little and have few orders ahead, but the agricultural works are stimulated by the good agricultural outlook, and Pipe-works continue to melt heavily. Prices of Bar and Structural Iron are unchanged, but an easy tone prevails.

**Pig-Iron.**—The local Pig-Iron market during the past week has been again dull and weak, with more pressure to sell Southern production, for some grades of which lower prices have been accepted. The large buyers who have been trying the market have retired temporarily, and even the aggregate of small orders has been less. The only transaction beyond the limit of carload or 100-ton business which has been made known since our last review is that of 500 tons Mottled Iron at \$12, cash, and one lot of the same grade reported at \$11.75, spot. Small amounts of No. 1 Southern Foundry have been sold at \$14.75, and No. 3 do. at \$13.25. Gray Forge has been easy at \$13 and prices of Bessemer and Northern Iron have been reduced, the former materially. The movement of Car-Wheel Iron has improved a little, but individual sales have been small. A short supply of Ohio Silvery Iron is predicted for the near future, another furnace making this grade having been suspended during the week. The failure of the Aetna Iron Works, at Ironton, making

Hanging Rock Cold-Blast Iron, had been discounted to a great extent during the past few months, and the effect upon the market at present is unimportant. The following are the approximate prices current here at the close, for cash, f.o.b.:

**Foundry.**

Southern Coke, No. 1 (new classification).....	\$14.75 @ \$15.25
Southern Coke, No. 2 (new classification).....	14.00 @ 14.50
Southern Coke, No. 3 (new classification).....	13.25 @ 13.75
Ohio Soft Stone Coal, No. 1.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2.....	14.50 @ 15.25
Mahoning and Shenango Valley.....	16.50 @ 17.00
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.00
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.00 @ 18.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

**Forge.**

Strong Neutral Coke.....	13.25 @ 13.50
Mottled Neutral Coke.....	11.75 @ 12.00
Gray Forge.....	12.75 @ 13.00

**Car-Wheel and Malleable Irons.**

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

**Nails.**—The demand has been moderate, and at free offerings it has been readily met at previous prices. 12d @ 40d sell at \$1.90 @ \$1.95  $\frac{p}{b}$  keg, with 10¢ rebate in carload lots at the mills. Steel Nails sell at \$1.90 @ \$1.95, and Steel Wire Nails at \$2.45 @ \$2.50  $\frac{p}{b}$  keg.

**Old Material.**—The market has been without improvement. Old Rails have been obtainable at \$20, cash, with buyers at \$19.50, spot. Old Wheels have been neglected, but there has been no pressure to sell, and prices have remained nominal at \$17 50 @ \$18  $\frac{p}{b}$  ton, cash.

**St. Louis.**

OFFICE OF *The Iron Age*, 212 N. Sixth st.,  
ST. LOUIS, May 6, 1889.

**Pig-Iron.**—The general tone of quietness which has characterized this department for some time continues, although the dullness is not quite so decided as it has been, and occasional sales are made that are indicative of some show of strength, even if in a small manner. The local trade is well employed, and if the activity continues for any length of time they will soon be in the market to replenish their stocks, as it is understood that few of the manufacturers have any great amount of stock on hand, and as the furnace banks are pretty well depleted, any decided movement made in the direction of larger buying is likely to result in some improvement in prices, and with this end in view furnaces are not disposed to make any great effort to push the sale of their product, as only small quantities are taken, and generally at prices that leave but little margin in the way of profit. We quote as follows for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry.....	\$15.50 @ \$16.00
Southern Coke, No. 2 Foundry.....	15.00 @ 15.25
Southern Coke, No. 3 Foundry.....	14.50 @ 14.75
Gray Forge.....	13.50 @ 14.00
Ohio Softeners.....	17.00 @ 19.00
Lake Superior Charcoal.....	20.50 @ 21.50

**Missouri.**

Charcoal Foundry, No. 1.....	16.00 @ 16.50
Charcoal Foundry, No. 2.....	15.00 @ 15.50

**Tennessee.**

Charcoal Foundry, No. 1.....	17.00 @ 18.00
Charcoal Foundry, No. 2.....	16.50 @ 17.00

Connellsville Coke, f.o.b. East St. Louis, \$4.55; St. Louis, \$4.70.

**Bar-Iron.**—There is considerable improvement to note in this connection, and mills are well filled with work. Prices show more strength, and the extreme quotations of some weeks since have been withdrawn from the market. For small

lots from store we quote \$1.80 and carload lots from \$1.60 to \$1.70, according to circumstances.

**Barb Wire.**—The improvement last noted continues, and mills are kept busily employed to make deliveries. The spring trade has been very large, and from present indications the demand is likely to keep up well into the summer months. Prices are firm and show a tendency to advance, and the low prices which have caused such demoralization in the trade during the first three months of the year have been withdrawn, and it is evident the mills that made the quotations have become tired of selling at figures that were certainly very close to cost. Mills quote from \$2.80 to \$2.85 for Painted and from \$3.40 to \$3.45 for Galvanized. Carload lots are quoted at from \$2.70 to \$2.75 for Painted and \$3.30 to \$3.35 for Galvanized, f.o.b. St. Louis.

**Detroit.**

WILLIAM F. JARVIS & Co., under date of May 6, 1889, report as follows: Business for the past week has been dull, and although a few good-sized orders for Lake Superior Charcoal have been booked, yet the general market does not show any improvement. Shipments are being made on old orders, and consumers generally are using as much Iron as usual and stocks in yards are light. Notwithstanding all these facts, buyers put off placing orders, except for immediate wants, until they can see signs of an immediate advance. If the turn comes without any warning, as it usually does, some of them may have to pay more and also be unable to secure special brands they are using. With a quiet market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$19.50 @ \$20.00
Lake Superior Coke, all ore.....	18.50 @ 19.00
Lake Superior Coke, cinder mixed.....	17.75 @ 18.25
Standard Ohio Black Band.....	18.50 @ 19.00
Southern No. 1.....	17.00 @ 17.50
Southern Gray Forge.....	15.00 @ 15.50
Southern Silvery.....	16.50 @ 17.00
Jackson County (Ohio) Silvery.....	18.25 @ 18.75
Old Wheels.....	18.50 @ 19.00

**Chattanooga.**

Office of *The Iron Age*, Carter and 9th Sts.,  
CHATTANOOGA, May 6, 1889.

**Pig-Iron.**—There is no change of interest to note. There appears to be a demand for the output of all the furnaces, as there is very little accumulating at the yards, and there has been but little if any change in prices to consumers. Occasionally when a furnace accumulates a good, round lot and the prospect of orders for consumption is not very bright some one is found with money, to whom the whole lot is closed out at prices which, of course, are not made public. There is considerable Iron now being placed in this way through the South. It will no doubt be kept out of the market so long as prices remain as they are. In reference to the future, nearly every one has "no opinions to express." All predictions in the past appear to have come to naught, and very few can now be found who have views on the subject. In the meantime there seems to be no diminution of output, and there are no intimations from any of the furnaces that they intend to blow out. On the other hand, there are several companies being formed to erect new stacks. These are, however, being done in connection with newly-laid-out towns, of which some will no doubt mature, as they are backed by parties who have already invested large sums, and having still greater means at hand can and will expend a great deal more in order to make available what they have already put in. At the present time mineral lands are commanding enormous prices, or at least considered so by the

old heads that for many years looked upon the ore lands as comparatively worthless, and what could have been bought a few years ago for \$500 to \$1000 are now selling for sums ranging from \$200,000 to \$500,000, and many transactions involving up into the hundreds of thousands are now taking place.

**Miscellaneous.**—A little episode took place a few days ago at the Lookout Rolling Mills, of this city, which may be of some interest to Southern Iron-masters. There arose a difference between the white employees and the management, which appeared to be irreconcilable, and they virtually agreed to disagree and were paid off. There appears to have been no particular friction nor interchange of harsh expressions, no threats or manifestations of trouble. In about four days the works started up again with negro labor exclusively, both skilled and common, and to-day are running as smoothly as ever. This makes three mills now running in the districts with negro labor exclusively, and there are also now three foundries which are running exclusively with negro molders and laborers. Among these men there exist no unions, no societies that have any semblance of combination, and as a general thing the men are sober and industrious and anxious to give satisfaction to their employers. Is it not significant of the future?

**Cleveland.**

CLEVELAND, May 6, 1889.

**Iron Ore.**—Business in the Ore market during the past week has been of a character quite satisfactory to the dealers. It is probably true that there have been sales of certain grades of Ore at prices from 15¢ to 25¢ less  $\frac{p}{b}$  ton than were asked for the same Ores at the beginning of the season, but there has been no general revision of quotations, and a few of the especially rich Ores maintain all the firmness prophesied for them at the beginning of the season. This is especially true of the output of one mine, which has commanded \$6.25  $\frac{p}{b}$  ton steadily, and is still in good demand at that figure, the Ore analyzing less than 0.02 % of phosphorus. Many of the transactions reported during the week have involved more than moderate blocks, and while it is true that some of the orders are indorsed upon the books "subject to market prices," it is equally certain that more of the sales have been entirely legitimate. Any differences of opinion that may exist between the Carnegie interests and certain mine owners do not affect the sales to Eastern furnacemen or to the heavy consumers in Chicago, these purchasers having already bought 1,250,000 tons of Ore at about the prices given in these reports since the opening of the season. At the headquarters of all the numerous mining companies in this city the market is pronounced active. It is doubtful, however, if over 20 % of the 2,500,000 or 3,000,000 tons of Ore likely to be consumed in the Mahoning and Shenango valleys and in Pittsburgh has been sold. The prevailing reports of the dispute over prices between the Ore men and many of the Pittsburgh and Mahoning Valley furnaces are considerably overstated, but a few of the heavy consumers believe that with the concessions obtained from the vesselmen and in view also of the drowsy condition of the Pig-Iron market slightly better figures should be expected from the Ore men. Some of them are accordingly confining their purchases to non-Bessemer Ores, over the prices of which there is less opportunity for controversy, and which are now offered at quotations slightly below those prevailing during April. Bessemer Ores from the Gogebic and Menominee ranges may also be bought at more favorable terms. Non-

Bessemer 62 % Ore has been offered at \$3.85 on cars at Buffalo and has been refused. The following are the quotations at present:

Specular and Magnetic Bessemer Ores	\$5.75 @ \$6.25
Specular and Magnetic Non-Bessemer Ores	4.50 @ 5.00
Red Hematite Bessemer Ores	3.50 @ 4.00
Red Hematite Non-Bessemer Ores	3.50 @ 4.00
Menominee Range Bessemer Ores	4.90 @ 5.10
Menominee Range Non-Bessemer Ores	3.50 @ 4.00
Gogebic Range Bessemer Ores	4.90 @ 5.25

**Pig-Iron.**—The market shows more activity than has been noticeable for five or six weeks. The inquiry for Iron has been much more vigorous, and a number of small transactions are reported at prices a trifle in advance of those offered last week. The tone of the market has unquestionably improved, though not sufficiently, perhaps, to justify the belief that the increased firmness is anything but a temporary flurry among purchasers. Furnacemen believe that consumers have finally reached the conclusion that additional concessions are out of the question and that they are anticipating an advance by placing orders at the present quotations. In any event the outlook has materially improved.

**Old Rails.**—The market is far from active and there is little doing even at the present price of \$21.50 for Old Americans.

(Later by Telegraph.)

Iron Ore sales aggregating about 300,000 tons are reported for the first three days of the week. Included in the amount are 150,000 tons from the Norrie Mine, at \$4.75, Cleveland delivery. Considerable non-Bessemer Hematite Ore, at about \$3.60, also for Cleveland delivery, has been sold since Saturday. The market has assumed a fair degree of activity and the present week's purchases seem likely to exceed those of any preceding six days since the opening of the season. Many of the consumers at Pittsburgh have still to enter the market.

## Louisville.

LOUISVILLE, KY., May 6, 1889.

**Pig-Iron.**—Very little has been done during the past week, and there is no change to note in the market. The feeling is still dull, and no sales of importance have been made. Small orders are numerous, but large buyers seem to be well supplied with Iron, the leading Pipe works especially. There are rumors of a contemplated reduction by the Thomas Iron Company, in the East, which can make little difference to any one save their own customers, as lower prices than theirs have been current quotations for some time past. We quote as follows:

Southern Coke, No. 1 Foundry, new classification	\$14.75 @ \$15.25
Southern Coke, No. 2 Foundry, new classification	14.25 @ 14.75
Southern Coke, No. 3 Foundry, new classification	13.75 @ 14.25
Gray Forge	13.25 @ 13.75
White and Mottled, different grades	12.75 @ 13.25
Silver Gray, different grades	13.00 @ 13.50
Southern Charcoal, No. 1 Foundry	13.25 @ 13.75
" " No. 1 Mill	14.75 @ 15.25
Southern Car-Wheel, standard brands	21.75 @ 22.75
Southern Car-Wheel, other brands	18.00 @ 19.50
Hanging Rock Coke, No. 1 Foundry	15.50 @ 16.00
Hanging Rock Charcoal, No. 1 Foundry	19.50 @ 21.00
Hanging Rock, Cold Blast	20.75 @ 22.75

## Pittsburgh.

Office of The Iron Age, 77 Fourth Ave. }  
PITTSBURGH, May 7, 1889. }

There has been no material change in the general Iron business during the past week; it is improving somewhat, but so slowly as to be scarcely perceptible from one week to another.

The strike at the Rail mill of the Allegheny Bessemer Company still goes

on; there is strong determination on both sides to win, but the indications at present are that the company will come out on top, but not until after the loss of a good deal of time as well as money, to say nothing about the uneasiness and worry caused thereby. The report circulated that Mr. Andrew Carnegie had contributed to the support of the strikers is not generally credited, and, we believe, is denied by Mr. Carnegie, although some of the strikers still aver that it is true. The rumor that there is trouble among the stockholders of the Allegheny Bessemer Company is denied.

The reduction in freight on Iron went into effect on the 1st inst. The rate on Pig-Iron from the Mahoning and Shenango valleys to Pittsburgh is now 65¢ per ton, instead of 80¢, and the rate from Wheeling to Pittsburgh the same as from the valleys. The rate from the valleys to Wheeling is 80¢; as the haul is much longer than to Pittsburgh there is no fault found therewith.

**Pig-Iron.**—The market continues in an unsettled and unsatisfactory condition. Demand continues light and prices have further declined. The probability is that there will be a speculative feeling developed within the next week if the market goes any lower, as a good many people have about arrived at the belief that it is a good time to buy, and if so there will no doubt be a reaction. Consumers, however, as a rule, continue to buy for immediate wants, but just as soon as some larger consumers commence to buy freely there will be a movement all along the line. While we do not quote Forge Iron below \$13.75, cash, it is rumored that a sale was made at \$13.50, cash. However, there are but few sellers under \$14, cash, for standard brands. We quote as follows:

Neutral Gray Forge	13.75 @ \$14.00, cash
All-Ore Mill	14.75 @ 15.25, "
White and Mottled	13.00 @ 13.50, "
No. 1 Foundry	16.25 @ 16.75, "
No. 2 Foundry	15.25 @ 15.50, "
No. 3 Foundry	14.50 @ 14.75, "
No. 2 Charcoal Foundry	21.00 @ 21.50, "
Cold Blast Charcoal	24.00 @ 27.00, "
Bessemer Iron	16.00 @ 16.25, "

**Muck-Bar.**—No sales reported; offering pretty freely at \$26, cash. There appears to be but very little demand just at present. So far as we are advised there have been no sales below \$26, cash, although it was intimated that it might be bought for less.

**Spiegel.**—Is quoted at \$30 @ \$30.50, cash, for 20 %, and Ferromanganese at \$58 @ \$58.50, cash, for 80 %.

**Manufactured Iron.**—Merchant-Iron is still quoted on a basis of 1.60¢ @ 1.70¢ for Bars for first-quality Iron, 60 days, 2 % off for cash. Old Rail Iron is being offered at 1.40¢ @ 1.50¢. Demand continues light, but there will doubtless be an improvement just as soon as buyers can be convinced that prices have touched bottom. There is a continued good demand for Skelp-Iron, and some of the mills are sold from 60 to 90 days ahead; prices remain unchanged at 1.60¢ @ 1.65¢ for Grooved and 1.90¢ @ 1.95¢ for Sheared.

**Nails.**—The Nail trade continues dull for the season, with but little prospect of any immediate change for the better. Advances from Wheeling within a few days are of a similar character. The Wheeling manufacturers have made a demand for a lower wage-scale, and it is probable that their demands will be complied with. Prices are still quoted at \$1.85 @ \$1.90 for 12d to 40d, 60 days, 2 % off for cash. Carnegie, Phipps & Co. quote Wire Nails at \$2.15 by the carload, 60 days, 2 % off for cash. It is still claimed that the Wire Nail is largely supplanting the Cut Nail.

**Wrought-Iron Pipe.**—There is a continued good demand, and the mills generally have about all they can do. Contracts have been made for 130 miles of

8 and 10 inch Pipe for early delivery to be used in laying a line from Ohio gas fields to the city of Sandusky. There are intimations of a still further contract for 400 miles of Pipe, but the particulars have not yet transpired. A Pipe line is also being laid from the Indiana gas fields to Louisville, Ky.; the work of laying the Pipe across the lower Ohio River has been commenced. The combination prices are being faithfully adhered to. Discounts on Black Butt-Welded Pipe, 55 %; on Galvanized do., 47½ %; on Black Lap-Welded, 67½ %; on Galvanized do., 55 %; Boiler Tubes, for 2 to 2½ inch, inclusive, 62½ %; 5½-inch Casing, 62½ % off; other sizes, 60 % off; 2-inch Tubing, 18¢ per foot, net; 8-inch Line-Pipe, 20¢ per foot, net; 6-inch do., 58¢; 8-inch do., 90¢.

**Old Rails.**—The Old Iron Rail market continues dull and weak. Sale of 1000 tons reported at \$22. On the other hand, there is considerable inquiry for Old Steel Rails, with light offerings, and for these the market is firmer; may be quoted at \$19 @ \$20 for Long and \$17.25 @ \$17.50 for Short Lengths.

**Steel Rails.**—Heavy sections are still quoted at \$26 @ \$27, cash, at mill, according to character of order, delivery, &c. As noted elsewhere, the strike at the mill of the Allegheny Bessemer Company still continues.

**Blooms, Billets, &c.**—Bessemer Steel Billets and Blooms are still quoted at \$27 @ \$27.50 and Nail Slabs at \$26.50 @ \$26.75. Sale of 2000 tons Domestic Bloom Ends at \$17.25, cash.

**Railway Track Supplies.**—No change in prices. Spikes, 2¢, 30 days, f.o.b. cars at works. Splice Bars, 1.70¢ @ 1.75¢; Track Bolts, 2.75¢ with Square and 2.85¢ with Hexagon Nuts. There is an increased demand, as there nearly always is at this season of the year.

**Old Material.**—Continues very dull and prices are weak; in a word, it is a buyer's market. Concessions have to be made in order to effect sales, and the demand is of a hand-to-mouth character. Sales of No. 1 Wrought Scrap have been made as low as \$18.50 per net ton. No. 1 Wrought Turnings may be quoted at \$18 @ \$18.50; Old Car Axles, \$24.50 @ \$25; Cast Scrap, \$14 @ \$14.50 gross; Cast Borings, \$11.50 @ \$12. Small sale of Old Car Wheels for foundry use at \$18.

## New York.

Office of The Iron Age, 66 and 68 Duane street. }  
NEW YORK, May 8, 1889. }

**American Pig.**—The largest single producer in the Lehigh Valley announced on Monday to its regular customers that the price to them on Foundry Iron, deliverable on contracts during the months of May and June, would be \$15.50, at tidewater, for No. 2, and \$16.50 for No. 1. It is distinctly stated that these figures do not apply to new business. The cut of \$1.50 is not quite so serious as it might appear at first sight because at their nominal figures of \$17 and \$18 the company in question were really considerably above the market, equivalent grades having been freely offered at lower figures, while, as we have stated, Southern Irons have been offered as low as \$16 for No. 1. It is claimed by the friends of the company that in reality they have been sustaining the market thus far, and that by their action now they merely meet the market. So far as Northern Irons are concerned the price of \$16.50 is a cut of at least 50 cents, so that the statement made alludes to Southern Iron alone. The leading Virginia company, who produce an Iron of acknowledged excellent quality, have met the cut, by reducing their price by \$1.50. The attitude of the Northern producers in this market is not yet clearly defined. Some commend the action taken; others

criticise it sharply as unnecessary. So far as the Southern furnaces are concerned they state their determination to hold their trade, and to them some margin for a further lowering is still left before they reach the parity of Western prices. With No. 1 Foundry selling in Cincinnati in small lots at \$14.75, the price at Birmingham, Ala., is \$12. Adding the freight of a shade under \$4, \$16 here can be done. Some of the Southern companies expect that some of their orders taken at a higher price for long-time delivery early in the year at higher prices will be canceled, especially in those cases where there has been delay in delivery. It is possible that the furnace companies will decline to renew them on a lower basis, in which case the buyers will be in the market again. It is not believed, however, even by those who would thus lose business, that the consumers would find any difficulty in placing their orders at \$16 with some of the furnaces which have lately blown in. The avowed purpose of the Lehigh company alluded to was to quicken deliveries during the months of May and June. It is generally believed in the trade that the company in question were driven to the step taken by the fact that their customers purchased other Irons in the open market at lower figures, and delayed deliveries of the Lehigh Iron on their season contracts. The ability of the Lehigh company in question to manufacture at the prices stated is above all question. It is generally understood that they can place their Iron at tidewater at \$18.50 as the average of the grades. They are now producing at the rate of nearly 8000 tons a week. But it is equally well known that there is not a single plant in Eastern Pennsylvania, New York or New Jersey shipping Foundry Iron to tidewater markets as its principal outlet which can come anywhere near the same figure. In fact, it is a serious question whether a single one can escape loss at the prices now ruling. There must be a sharp restriction of output, and our monthly blast-furnace returns show that reduction has already begun. We know that a number of plants seriously contemplated blowing out, and others are now likely to reach the same decision. So far as the Southern furnaces are concerned, we doubt whether the latest developments in the market will cause any stoppage whatever. They cannot close up the Thomas Iron Company, but they can undoubtedly live where the other furnaces in the Lehigh and Schuylkill Valleys, in New Jersey and New York are losing money. This, however, it should be distinctly understood, refers only to those furnaces which are running on Foundry Irons of standard grade for the open market. The whole question has nothing whatever to do, first, with the plants in the Lebanon Valley, who can outlive any manufacturers in any part of the United States. It has nothing to do with those furnaces in the whole territory named which are producing Bessemer Pig, or with those which are making Mill Iron for their own use, nor furthermore with a few specially well-situated furnaces making Mill Iron for the open market. These facts should be thoroughly understood. We quote No. 1 Foundry, \$17 @ \$17.50; No. 2 Foundry, \$15.75 @ \$16.25, and Gray Forge, \$14.50 @ \$15.25, with Southern Iron at \$16 @ \$16.50 for No. 1 Foundry.

**Foreign Ore.**—Freights on Foreign Ore are a little lower, having declined from 15/ @ 15/6 to 14/ @ 14/6 on Maraballa, which are generally about 1/6 @ 2/ higher than freights from other points. Mokta Ore is quoted about 10¢ per unit, ex-ship, with a moderate demand.

**Spiegeleisen and Ferromanganese.**—The only sale reported is a lot of about

500 tons of 20 % at about \$27.50, New York. Ferro is selling in a small way at \$56.50 @ \$57.

**Structural Iron and Steel.**—A moderate business in being done in a small way for local architectural work. We continue to quote: Sheared Plates, 1.9¢ @ 2¢; Universal Mill Plates, 2¢ @ 2.1¢; Angles, 1.9¢ @ 2.1¢; Tees, 2.35¢ @ 2.5¢, and Channels and Beams, 2.8¢, on dock.

**Plates.**—We quote Iron Tank, 1.9¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank, 2.15¢ @ 2.25; Shell, 2.35¢ @ 2.4¢; Flange, 2.55¢ @ 2.75¢, and Fire-box, 3¼¢ @ 4¢.

**Bar-Iron.**—The market remains dull. We quote: Carload lots on dock, Common, 1.6¢ @ 1.85¢; Medium, 1.65¢ @ 1.7¢, and Refined, 1.7¢ @ 2¢.

**Steel Rails.**—Eastern mills report only a few small sales. A Pittsburgh mill has taken 11,000 tons for an Alabama road at a delivered price. It is intimated that the net price is higher than figures lately made because of the character of the financial arrangements. The Chicago mills are reported to have taken about 12,000 tons lately for the allied lines of one of the transcontinental roads. A meeting of the rail manufacturers is to be held in Philadelphia on Saturday. We quote the market \$27 @ \$27.50 at Eastern mills for large lots. So far as can be learned, 20,000 tons being offered on behalf of speculators have not yet been placed.

**Wire-Rods.**—There is some inquiry for Foreign Rods, but prices continue high, restricting business to very narrow limits. We quote, nominally, \$42 @ \$42.25 for small lots.

**Old Rails.**—The market is featureless, with prices nominally \$22 @ \$23.

**Scrap-Iron.**—We note a sale of about 100 tons at \$20, f.o.b. cars, Jersey City.

**Rail Fastenings.**—Very little is doing. Spikes continuing \$1.90 @ \$2 and Angles 1.75¢ @ 1.80¢ in large lines.

## Financial.

Trade circles are gradually recovering from the condition of "suspended animation" incident to the Centennial celebration, the streets having been effectually barricaded for three days, and in some lines of traffic a fair business is in progress. As a whole, however, the impulse expected from the presence of numerous visitors from a distance has not been realized. In the dry-goods trade a considerable force of out-of-town buyers was noticed, but activity is more perceptible in the shipments by cheap transportation routes, available since the opening of navigation. Lake vessels are taking the bulk of eastward shipments from Chicago. The Clearing-House returns show a decrease in New York of 34 % compared with the same work last year, and in Boston a decrease of 20 %. Outside of New York there is an aggregate increase of 27.4 %. Just now attention is directed to the proceedings of the Interstate Commerce Committee at the Fifth Avenue Hotel, the special point of inquiry under the lead of Senator Cullom being the relation between the railroads of this country and Canada and the disabilities said to be placed by the Interstate Commerce law upon American roads in competition with those of Canada. Chairman Albert Fink, of the Trunk Line Association, on Monday was interrogated for four hours. He described himself as "the head of a bureau whose object is to arrange joint tariffs between competitive points in such a way as to secure uniformity and to maintain the rates established." The Grand Trunk line was in the association, and the Canada Southern was operated under a lease by the Michigan Central. The Canadian Pacific has as yet

had nothing to do with the association. The Grand Trunk has for a dozen years had a differential rate on through business from Boston and New England of 10¢ @ 100 on first-class freight, and a similar proportion on cheaper classes. It has also exacted, without consent of the other roads, a differential of 15¢ on New York business by way of New London. If it were compelled to charge the same rates as the other trunk lines it would have to go without business. The presidents of the Erie, New York Central and other railroad companies were in like manner called on for testimony. Another notable fact is the announcement of a reduction in the price of iron, also the selling of coal by the Reading Company at a concession from the prices made in New York. The breadstuffs and grain markets seemed to be working under better conditions as concerns the export business, but cables are again lifeless and in some instances easier. A British steamer has been chartered to load corn from this port, the first grain charter reported here for a long time. The cotton and coffee speculations have been livelier. Sugar refiners have been compelled to reduce prices ¼¢ @ ½¢ because of light buying.

The Stock Exchange market did not open until Thursday, when the tone was strong, with considerable buying on European account. On Friday there was a further improvement, Chicago, Burlington and Quincy leading on reports of increased earnings, the other grangers and Atchison, Topeka and Santa Fé closely following, and Northern Pacific preferred being favorably affected by news of the traffic arrangement with the Wisconsin Central. On Saturday the market was strong at the opening, but became irregular. On Monday the chief interest was in Atchison and Reading, Boston houses buying the former freely in prospect of success in the reform movement at the annual meeting to-day. The reduction of \$1.50 a ton for pig-iron by the Thomas Iron Company had little effect upon the coal stocks. On Tuesday the market was dull and irregular. The features were Atchison, Reading, Union Pacific, Northern Pacific preferred, Oregon Transcontinental and the grangers. The latter were well supported and gave evidence of some inside buying. The earnings of the granger roads are now beginning to show the importance of the strict adherence to the Interstate Association agreement.

United States bonds were firm, the latest sales reported at the board being \$10,000 4s registered at 129½ and \$20,000 4s coupon at 129½. Quotations as follows:

U. S. 4½s, 1891, registered.....	108¾
U. S. 4½s, 1891, coupon.....	108
U. S. 4s, 1907, registered.....	129¼
U. S. 4s, 1907, coupon.....	129½
U. S. currency 6s.....	121

The regular financial statements for the month of April issued by the Treasury Department show the continuance of increased revenues. The Treasury surplus is greater by \$1,500,000 than a month earlier, and \$7,000,000 greater than when the new Administration began. It is still only about half as large, however, as on May 1, 1888—\$55,600,000, compared with \$110,200,000.

The weekly statement of averages of the Associated Banks for four days show an increase in loans of nearly \$2,000,000, a loss in lawful money of nearly \$4,000,000, and as the deposits have not changed materially, the surplus is also reduced nearly \$4,000,000. The loss in lawful money is due partly to absorption by the Treasury Department and partly to the withdrawal of \$3,000,000 for export. The surplus reserve is now \$9,522,575, against \$18,170,075 in the corresponding week last year, \$4,522,600 in the preceding year and \$11,113,525 in 1886. Although the surplus is large enough at present for all probable contingencies, the experience

of the week shows how easily embarrassments might arise in case of large demands from abroad or restricted offerings of bonds. The alleviating feature is continued liberal exports of commodities. Last week the imports were above the average, the valuation being \$9,848,500, of which nearly \$3,000,000 represents dry goods. Since January 1 the total is \$178,870,900, as compared with \$171,102,000 for the corresponding time in 1888 and \$165,500,000 in 1887. Exports dropped to \$4,299,052.

Rates for money were temporarily advanced by the unexpected withdrawal of gold for export and a simultaneous calling in of loans by a prominent banking-house, but money was promptly offered in any needed amounts, and rates again became normal. No change is noticeable in the market for time loans, and rates remain as last quoted— $2\frac{1}{2}\%$  for 60 to 90 days,  $3\frac{1}{2}\%$  for four to six months and  $3\frac{1}{2}\%$  for six, seven and eight months. Commercial paper is still in good request from all quarters, but rates are unchanged at  $3\frac{1}{2}\%$  @  $4\%$  for 60 to 90 day indorsed bills receivable and  $4\frac{1}{2}\%$  @  $5\frac{1}{2}\%$  for longer dates. It is remarked that for some reason not readily apparent the supply of paper offering is materially increased, chiefly from the interior.

The posted rates for bankers' sterling were advanced to \$4.88 for 60-day and \$4.89 $\frac{1}{2}$  @ \$4.90 for sight. The market is dull and a shade easier.

Stockholders representing two-thirds of the stock of the Union Bank, in Fifth avenue, wound up the affairs of the bank by selling their interest to the Columbia Bank, of Fifth avenue, and sent in their resignations. The trouble was lack of business.

## Coal Market.

The Anthracite Coal trade has a more cheerful tone, there being of late more disposition to buy than for several months past. The improvement, such as it is, is probably due to the advancing rates of freight to Eastern ports, as the increased cost of vessel transportation, it is reasoned, may more than offset any advantage to be gained by longer waiting. Just now interest among local jobbers is absorbed by the pending contract with the Brook-

lyn School Board, competition being sharp, at low figures. The main fact to be noticed is the better inquiry. Pea Coal, Free-Burning, may be quoted \$3 alongside, and the harder brands 15¢ @ 20¢ less. Buck-wheat is \$2.25 alongside. The regular companies claim that prices are fully held and are firm, also that individuals are getting more than they did. The Reading Company are reported to be cutting prices for the line trade 10¢ @ 20¢ below the circulars. The belated and suppressed official returns of Anthracite Coal tonnage for March show that the production for the month was 2,103,068 tons, a decrease of 582,666 tons as compared with March, 1888. For the year to March 31 the tonnage was 6,823,254 tons, a decrease of 646,489 tons. The Wyoming region fell off 1,957,436 tons as compared with 1888, and the Lehigh and Schuylkill regions increased 949,541 tons and 361,406 tons respectively. In the three months the Reading is ahead 431,290 tons, the Lehigh Valley 214,340 tons, the Jersey Central 97,577 tons, and the Erie 85,201 tons. All the other roads fell off in tonnage, the Lackawanna having the greatest loss, 842,878 tons. The stock of Coal at tide increased 61,567 tons during March.

The Anthracite production for the week ending May 4 is 498,651 tons, as compared with 552,000 tons for the same week last year, and the total since January 1 is 9,504,759 tons, a decrease of 1,456,000 compared with 1888. It is understood that the Lehigh Valley Railroad Company have withdrawn their opposition to the publication of the complete monthly Coal statistics. The collieries drawn in the Schuylkill region to fix the rate of miners' wages for March showed the average price of Coal at the mines to be \$2.39. The rate of wages is, therefore, 4 % below basis.

The Bituminous trade is dull, now that nearly all the usual spring contracts have been filled, but there is a good amount of Coal in course of delivery. It is noticed that as a rule no prices are made public, the supposition being that pool prices prevail. It is charged, on the other hand, that nearly all the recent large contracts were closed at a concession made by shippers in the mining regions.

Respecting the decision awaited in the case of Coxe Brothers the Philadelphia Press says: "The doubt about the decision of the Interstate Commission in the Coxe suit against the Lehigh Valley unsettles the Coal trade. The buyer holds off on the idea that the decision may lower the tolls. He is probably mistaken, as the issue is too important to be brought to a sudden conclusion. If the Interstate Commission decides against the company on the question of tolls an appeal will no doubt be taken to the Supreme Court, which would cause a delay of several years, but in the meantime it is not likely that the high tolls for Anthracite Coal could be kept up. Mr. Gowen's argument in the Coxe case has been circulated about a good deal during the past ten days, and, while it is often sophistical, it contains many points which strongly appeal to a sense of right. There is no doubt whatever that in the next two years Anthracite Coal tolls will be reduced to the basis of, say, \$1.25 from the Schuylkill mines to tide. This means a great change in the earning capacity of the Coal-carrying roads. Another matter of importance which will come up in the near future is the relations of such companies as the Reading Coal and Iron Company, the Lehigh and Wilkes-Barre Coal Company and the Lehigh Valley Coal Company to the State and to the railroad companies which control them." The Record says: "It is reported that the New York, Ontario and Western Railroad, which is now building an extension into the northern Coal field, has contracted to carry Coal

to market for 40 % of its selling price, a rate that will be decidedly lower than that at present in force."

## Metal Market.

**Copper.**—Since our last week's report Copper has been steady in London at £28. 5/ for both spot and futures, sales aggregating 600 tons. Sales to consumers have been made in this market of Lake Copper with the price to be fixed hereafter. Toward the close of this week the American delegates of mining companies are expected to arrive on their return trip from Europe. We shall know then what the result of their labors over there has been. We print the story of the Boston Herald elsewhere. It is contradicted by the mining companies who claim that a representative has remained abroad with full power to act, and that 12¢ is likely to be the figure settled upon for Lake. The syndicate contract with the mining companies under which no deliveries were to be made for two months expires on the 15th inst. The statistics of visible supply in England and France May 1 showed a decrease of 400 tons in April, being 124,470 tons. During the first nine months of the fiscal year there were shipped from the United States 13,469,686 lb of Ingot Copper, against 18,809,506 same time last year. Spanish exportation during the first two months of the year amounted to 180,156 tons of Pyrites, against 113,869 in 1888 and 128,200 in 1887; of Precipitate, 3811 tons, against 3344 and 4914 tons.

**Tin.**—From £91. 5/, spot, Tin gave way in London since our last report to £89. 10/ yesterday, and futures from £92 to £90. 7/8, owing, it is presumed, to the unfavorable statistics, which exhibited an increase in the visible supply in Europe and America on the 1st inst. of about 500 tons, in consequence of more having been shipped from Singapore. Sales for the week in England summed up 600 tons. Our own market was moderately active at generally drooping figures, 10 tons spot bringing 20 $\frac{1}{2}$ ¢, and declining to 20¢ subsequently, while 20 tons June fetched 20¢ and 10 tons September 20 $\frac{1}{2}$ ¢. The imports of Tin into the United States during the first nine months of the fiscal year were 25,464,667 lb, against 23,573,978 last year. At the Metal Exchange on first call this forenoon 60 tons May Tin brought 20 $\frac{1}{2}$ ¢. In a jobbing way spot Tin closes at 20 $\frac{1}{2}$ ¢ @ 20 $\frac{1}{2}$ ¢ to-day. **Tin-Plates.**—The market has been quiet and prices are a shade easier. In Liverpool there has been a decline of 3d per box, chiefly owing to the drop in Pig-Tin, but also to a lack of demand. The import of Tin-Plates into the United States during the first nine months of the fiscal year was 527,891,085 lb, against 452,030,389 last year. We quote, large lines, ordinary brands, per box: Siemens-Martin Steel, Charcoal finish, \$4.80 @ \$5.50; Coke finish, \$4.60 @ \$4.70; Ternes, \$4.12 @ \$4.30; Coke Tins, \$4.25 @ \$4.35, and Wasters \$4.12 $\frac{1}{2}$  @ \$4.15.

**Lead.**—There has been a good deal of uncertainty and excitement; the pros and cons of the question of the exclusion of Mexican Ore we discuss editorially in another column. Sales in the open market aggregated 1500 tons, at all sorts of prices from 3.75¢ to 3.95¢, the closing quotation being 3.95¢ @ 4¢, and at the West, 3.60¢ @ 3.65¢. Spanish exportation during the first two months was 22,648 tons, against 23,261 in 1888 and 24,268 in 1887. On first call this forenoon there were sold at the Metal Exchange about 50 tons June at 3.92 $\frac{1}{2}$ ¢, and 35 tons July at the same figure.

**Spelter.**—Has remained featureless at 4.62 $\frac{1}{2}$ ¢ @ 4.65¢ for Common Domestic, with little doing, and 5 $\frac{1}{2}$ ¢, nominally,

Digitized by Google

# Hardware.

Business in this market was seriously interrupted, and for the greater part of last week practically suspended, by the centennial celebration. The present week opens with a moderate volume of trade and without marked changes in the character of business, prices being, however, weak and irregular, the tendency being toward lower quotations in several lines. The decline in the price of iron contributes to this result. It is, however, to be borne in mind that the general line of goods is unchanged and a fairly satisfactory condition of things exists throughout the country.

We continue below the review of business which is based upon detailed and specific advices in the different States, and the reports given refer, it will be seen, to the far West and the Pacific Coast:

## Montana.

Business in general is good, with encouraging prospects for the coming year. The activity in mining induces a very satisfactory business in Hardware and related lines, and merchants interested in this business report a considerable increase over last year for a corresponding time. Stocks in general are fair, and in some cases, in order to accommodate a very satisfactory business, are heavier than usual. Throughout the State there is a hopeful feeling, and the development of mining and the success which attends it promise well for future business. Travelers who visit the trade throughout the State generally give gratifying reports as to the condition of things coming under their observation, and their orders indicate a healthful state of trade. There will be a good deal of building in some of the principal points, and the construction of railroads and activity of mining enterprises promise well for the future.

## Wyoming.

Business is reported as reasonably good and the outlook fair, with the intimation, however, that there is a prospect of a dry season and low price for cattle. Owing to the distance from market, fairly full stocks are generally carried. The prospect for building is only fair, and money is scarce and collections slow. There appears to be a general and steady development of the resources of the Territory, and the prospects for a good trade are all that could reasonably be expected.

## Colorado.

General business is in excellent condition, and reports on this point are very satisfactory, indicating that in many places trade is better than for several years past owing to the continued settlement and development of the country. Stocks of Hardware are in nearly all cases good and in many instances large, purchases having been stimulated not only by the low prices which have ruled, but also by the cut rates in freights, which induced many merchants to buy freely, especially in heavy goods, and some of our advices indicate that Barb Wire, Nails and other Heavy Hardware is being offered at cut prices in order to reduce stock. The volume of business in Hardware is satisfactory, and averages better than former years, our advices without exception indicating that merchants are doing an excellent trade. The fact that prices are low and weak is recognized. The outlook for building is also gratifying, and in some places is promising, the expectation being that there will be more than the usual number of houses erected. Agricultural conditions are also satisfactory. The crop last year was rather below the average,

but notwithstanding the generally satisfactory prices obtained collections have been sluggish, though they are probably to be regarded on the whole as fair, some merchants reporting them good and others in other parts of the State emphasizing the scarcity of money. The prospect of the crops for the present year is regarded as promising, the recent rains having improved the situation and removed to a good extent the apprehension of a dry season following a winter in which there was much less than the usual snowfall.

## Idaho.

Business has felt the effect of the damage of the last year from the grasshoppers, but farmers are not discouraged and have been making preparations for an increased acreage, and trade in Barb Wire and Implements has been good. It is not expected that business will be very good in the near future, but with abundance of rain the prospect for a good crop is regarded as promising and farmers are cheerful. Money is scarce and collections hard.

## New Mexico.

Owing to a very severe winter losses in stock have been heavy, and in consequence the spring trade has hardly been up to the average, though merchants have but little reason for complaint, and traveling salesmen report sales better than last year. The following additional points are given by one of our correspondents:

The Hardware trade, in sympathy with other branches, is fuller than usual, on account of losses in stock. Heavy Hardware and Iron have depreciated in prices and freights are lower. The prospects for trade for the fall months are good, as all the surplus cattle are sold to Montana buyers for future delivery. Prospects for building are dull. Collections are slow. The wool crop has not yet been marketed.

## Arizona.

Business in general is in fairly good condition. The cattle interests have been depressed on account of the low price of beef on hook of 1½ cents, against 2½ cents a year ago. The break also in the copper syndicate has had an injurious effect, but producers are hoping for a reaction. More interest is being taken in agricultural pursuits, which is having a salutary effect on the general prosperity. There is more activity in the mining interests outside of copper than has been seen for the past two years.

## Oregon.

The past year was exceptionally satisfactory and showed a decided increase in business over former years. Since the 1st of January trade has also been in good shape and Hardware has shared in the general activity. The agricultural conditions are favorable to business and point to an excellent fall trade. Stocks of Hardware are in some cases ample, and houses are buying freely according to their requirements. There is a good deal of building throughout the country and in the principal towns. The number of settlers who are coming into the country and the activity in real estate and general progress toward development render the outlook for business satisfactory.

## Washington.

The rapid development of the country stimulates business, and merchants are in good shape to take care of it, carrying ample stocks. Trade is satisfactory, and the prospect for the next few months is generally regarded as fair. But little complaint is made in regard to collections. The activity in railroad building contributes much to the general prosperity. Referring to the section lying west of the Cascade Mountains, and comprising what is known as the Sound Country, of which the principal towns are Seattle and Tacoma, we have the following advices:

Business is good, though there has been a falling off in both the production of coal and lumber by the lack of demand from California

for the former and from California and abroad for the latter. The mills engaged in supplying the local markets cannot begin to fill orders promptly. With the growth of towns and steady influx of immigrants, stocks not only of Hardware, but all other commodities, have been increased. The prospects for trade for the near future, as well as for the balance of the year, are excellent, and the number of buildings erected in all towns will probably be larger this year than any year before. It is too early to tell what the hop crop is likely to be this season, but the outlook for the wheat crop of Eastern Washington is very good, and, as almost all the wheat that is exported comes now to Tacoma for storage and shipment, it necessarily benefits the trade of this community.

## California.

Reports from this State are very satisfactory, and indicate a healthful condition of general business, with a steady and regular trade in Hardware, which is in good demand not only for staples but for goods generally, which are being purchased by merchants in quantities to meet their actual requirements. Stock are on the whole about average. Comparatively little complaint is made in regard to prices, which are pretty well held on their present low level. Competition is such that margins of profits are close. It is anticipated that there will be a fair and steady trade, especially as the prospects for building are in most cases referred to as promising. From Los Angeles we have advices that a large amount will be spent on public buildings this year, and from other points there are indications of more than usual activity in this line, especially in the central and northern portions of the State. The agricultural conditions are referred to almost uniformly as excellent, plentiful rains having given good prospects, so that if nothing unforeseen happens to prevent the crops will be excellent, and this will go far to secure good business and prompt payments. Some complaint is made of collections as having been slow, but they are probably to be regarded as about fair, and at present better than they were a few months ago. Many country merchants, however, are carrying very large accounts which they hope to be able to collect this year. Some towns are giving evidence of steady and healthful growth, while others are standing still and a few retrograding. The following summary, which comes from one of the largest jobbing houses on the Pacific Coast, will be valued as confirming or modifying the above:

Business in general is not as good as at same time last year, and is in fact somewhat dull, and the same remark applies to Hardware. Judging from the size of orders as they come in would infer that dealers are fairly well stocked, and are not ordering more than is actually necessary. Prices remain about the same as last year, and if there is any difference they are a trifle stiffer. The prospects for trade during the next few months are favorable, as is also the outlook for building, particularly in the central and northern parts of the State. Fruit and grain crops at present are looking first-class. Collections are fair, and the impression is that the fall trade will be large.

## Cut Nails.

The New York market is quiet, with quotations remaining unchanged at \$1.80 to \$1.85 for carload lots on dock, which, however, is occasionally shaded.

## Miscellaneous Prices

The following are the prices of the new line of Galvanized Sprinkling Pots which are manufactured by Sidney Shepard & Co., Buffalo, N. Y., the list being subject to a discount of 3½ and 10 per cent.:

No. 40, 8 quarts.....	per dozen, \$10.00
No. 50, 10 quarts.....	" 11.65
No. 60, 12 ".....	" 13.30
No. 70, 16 ".....	" 16.00
No. 80, 20 ".....	" 20.00

The Maryland Tack Company, Baltimore, Md., issue a discount sheet applying to Hardware list of prices January 2, 1888.

It is based on 72½ per cent. discount on American Iron Carpet, Steel Carpet and Swedes Iron Carpet Tacks.

The following are the prices of Stove Polish manufactured by the Nickel-Plate Stove Polish Company, 21 and 23 River street, Chicago:

	Per gross.
Nickel-Plate Paste, ¼ and ½ gross boxes.	\$6.00
Black Jack Liquid, ¼ and ½ gross boxes.	9.00
	Per pound.
Black Eagle Benzine, 5 and 10 lb cans.	\$0.12
Black Jack Water, 5 and 10 lb cans.	.12

Thomas Laughlin & Son, Portland, Me., have reduced the price of Iron Sheaves and Tackle Blocks, and now quote from manufacturers' standard list, as follows:

	Discount.
Common.....	70 %
Patent.....	60 %

They allude also to the quality of the goods and state that the above prices are subject to change without notice.

#### Items.

The partnership of Blanchard, Parker & Co., 71 and 73 North street, Boston, Mass., was dissolved by mutual consent May 1. Chester Parker will carry on the business at the old stand under his own name.

An announcement addressed to manufacturers appears on page 48, in which the advantages of Belleville, Ont., Canada, are referred to, as well as the inducements which are offered in the way of free land, exemption from taxation and financial assistance. Belleville is alluded to as having railway connections in every direction, and her water communication extends to Montreal on the east and to all the ports on the great lakes west.

Ball Bros. Glass Mfg. Company, Buffalo, N. Y., send out circulars describing Cooley's Patent Wood Jacket Butter Packages, which are made from tin-plate incased in selected ash jackets.

Everson & Co., Syracuse, N. Y., have secured a large five-story building, consisting of three stores, Nos. 8, 10 and 12 South Clinton street, between the Erie Canal and Railroad street, where they offer a full line of Builders', Blacksmiths' and Machinists' Hardware, Sash Doors and Blinds, Paints, Oils and Mill and Contractors' Supplies. In addition to the above their assortment of Guns, Revolvers, Ammunition, Cartridges and Sportsmen's Goods is alluded to as especially complete. Their establishment, with the advantages offered by their new location, is a very complete and extensive one.

Our readers will observe on page 718 the description of the Dandy Apple Parer, Corer and Slicer, which is manufactured by the Goodell Company, Antrim, N. H. The advantages possessed by this machine are there alluded to. The company do not intend to make any exclusive agencies this year, but allow their machines to be sold by the Hardware trade generally. It is intended to retail at \$10, and the company anticipate that it will have a large sale.

Allendale Lock Company, Lancaster, Pa., announce under date May 6 that they have discontinued the manufacture and sale of Scandinavian or Jail Padlocks known to the trade as Nos. 9, 10, 11, 12, 13 and 14; 119, 120, 130 and 140; 109, 110, 111, 112, 113 and 114; 209, 210, 211 and 212.

The W. Bingham Company, Cleveland, Ohio, send out a budget of new pages for their catalogue in order to bring it up to date in its revised lists and in its presentation of new goods which have been added to the assortment since their catalogue was issued. The large number of additions thus made illustrates not only the enterprise of the house, but the progress that is constantly being made in Hardware.

They have also issued their discount sheet No. 3, which is of interest as giving the present prices on the large variety of goods they handle.

The Coleman Hardware Company, of Morris, Ill., have removed their main office from 53 Dearborn Street to 59 Dearborn Street, Chicago, room 308.

New Process Twist Drill Company, Taunton, Mass., have issued a revised price list of their Hot Forged Straight Lip Increase Twist and Bit-Stock Drills. Their preface refers to the special features of these Drills and the advantages possessed by them, in the fact that they are hot forged and not milled, giving, they claim, a mild center, while by the process of forging the point and the cutting lip of the Drill are rendered especially tough and firm. The different patterns are illustrated, with list prices.

E. T. Barnum, Detroit, Mich., has issued a spring supplement, which embraces many seasonable goods, including Settees, Flower Stands, a variety of Wire constructions for the lawn, Crestings, Railings, Stable Hardware, &c. He also issues a separate catalogue of Reservoir Vases.

Walbridge & Co., Buffalo, N. Y., have issued their illustrated catalogue of summer goods. In it nearly 50 pages are devoted to Steel Goods, Rakes, Scythes, Hoes, Lawn Mowers, Spring Hinges, Freezers, Fishing Tackle, Haying Tools, &c. Among these Reed's Hay Fork Pulleys are shown.

The Delaware Case and Table Company, a recently-organized company located at Delaware, Ohio, write under date of 25th ult. that their productions for the present will embrace the Hunter & Smith Revolving Screw and Bolt Cases, Hill's Meat Cases, designed for the use of retail grocers and meat men, the Cragneili & Neff "Hollands Case," a device for the re-tailing of Window Hollands, the Hunter Store Truck, weighing but 15 pounds. They state that they also manufacture a line of Extension and Fancy Tables, that their facilities are good and that they are turning out each of the articles mentioned in a neat and attractive style and will add to the line as occasion demands.

Montague-Woodrough Saw Company have secured more commodious quarters at 104 Pullman Building, Michigan avenue and Adams street, Chicago, where they have ample facilities for filling orders for their B. M. T. Patent Tooth Saws. They also issue a circular describing this Saw and giving cuts showing the manner in which it is filed.

Wilcox, Crittenden & Company, Middletown, Conn., issue a circular describing their "Running Rings." This is a curious and ingenious Chain, composed of 88 interwoven rings, but the arrangement is such that the rings appear to disentangle themselves and run down the entire length of the chain.

The Chicago branch of the Ansonia Brass and Copper Company changed its location on the 1st inst. from 64 Washington street to 133 and 135 Wabash avenue. The company's new quarters are much larger than they were in possession of at their old location, and their facilities for the transaction of business are correspondingly increased. In connection with the Ansonia Clock Company they will occupy three floors and basement of the large double building. Gilbert M. Smith, Western manager of the company, states that while they have always carried a large stock of goods at Chicago they will now make it much heavier. Their line of Copper goods will be particularly large to supply Western markets, making a specialty of Sheets, Bottoms and Cornice

material. Their trade in these products of their works is steadily increasing in the West, and the expansion of their facilities had become imperative.

Holt Mfg. Company, Cleveland, Ohio, issue a circular illustrating their Combined Anvil and Vise, the invention of their John P. Holt. It is reported as meeting with a large and satisfactory sale. The vise is so made that it can be separated from the anvil by driving out the key with a single stroke of the hammer, and can be used as a clamp separate from the anvil. The back jaw has a lip projecting over upon the anvil, so that anything held by the vise can sustain heavy hammering.

Perry, Stearns & Co., 201 Madison street, Chicago, Ill., agents for the American Rubber Company, Boston, Mass., announce that they now carry a full stock of Rubber Garden Hose, and can also execute prompt orders for Steam Hose, Engine Hose, Suction Hose, Rubber Belting, Packing, &c.

F. G. Sherman & Co., Closter, N. J., manifest enterprise in the prosecution of their business in publishing for general distribution among those likely to be interested Hardware List No. 1, which gives a brief description and prices, without cuts, of some of the leading articles in the line of door furnishings, including Locks, Night Latches, Bell Pulls, Name Plates, Bolts, &c.

#### Obituary.

At a meeting held to-day at the rooms of the Hardware Board of Trade by the Hardware friends of Joseph B. Spencer, late of Brown Bros. Brass and Copper Rolling Mills, a committee was appointed to draft a set of resolutions to be suitably engrossed, expressing regret at his death and sympathy for his family. The committee consists of the following gentlemen:

JOHN C. MCCARTY, Chairman.  
JOHN G. WITTE,  
EDWARD BERNARD,  
JOHN H. GRAHAM,  
CHARLES X. CORDIER.

The committee was also instructed to have engrossed suitable resolutions upon the occasion of the death of Launcelot S. Gurney, only son of Fred. B. Gurney, killed at the late railroad accident near Hamilton, Ont.

#### Trade.

We have the following advices from Dudley Bros. & Lipscomb, Nashville, Tenn., in regard to trade in that section:

Trade has been quiet for the last 30 days in all lines except dry goods. The Hardware trade is always dull at this season of the year, though the trade in Cultivating Implements and Harvesting Machinery is very good. The jobbers here have only a fair stock of goods in store, as their trade has been better than usual in volume, and they do not generally replenish for the fall business until the last of June or July. The prices on all staple goods, such as Bar Iron, Nails and Barb Wire, are very low, Iron particularly being as cheap as ever known in the history of our market, though there are some signs of its stiffening a little. Prospects for building during the summer season are fully as good as usual. The weather has been exceedingly fine, and the farmers are very forward with their crops. There are indications for an abundant supply of all kinds of fruit. Collections are not as good as the prosperous condition of the country would seem to justify. The country banks all seem to have a surplus of money, but they don't seem anxious enough to loan it to the average country merchant. Our traveling men report health and prosperity and fine crop prospects in every section of our territory, and we are looking forward to a first-class summer and fall trade.

From a well-known house in Charleston, S. C., we have the following careful and interesting review of the market:

The general business of Charleston has been above an average, and is entirely satisfactory

to those houses who desire and seek their trade. The territory is increased by every effort, and gives encouragement for continued and persistent exertion. The Hardware business has been specially prosperous, and the volume of trade, both local and throughout the State, largely in excess of former years. While the advantages offered by dealers are fully as good as those of any other market, a thorough knowledge of the wants of interior merchants causes many of the largest dealers to rely exclusively upon Charleston for their supplies. The stocks carried are large and varied, very many lines being kept in stock that are entirely excluded by the general jobbing trade in Northern and Western markets. This is rendered necessary not only on account of distance from depot of supplies, but from the nature of the general business done by the patrons of this special business. Prices have been very uniform during the past year, and no marked changes have taken place. The impression is general that they have reached a point below which only disaster to manufacturers will result if reductions are either contemplated or enforced. It is rather early to forecast the future, as the crops from which prosperity is expected or derived are hardly yet planted, but the climatic conditions are more favorable this season than many we could name, and the general impression is that the year will be a very prosperous one. From every section of the State we have reports of building new and improving old structures, and the disposition to enlarge and improve seems to be general among all classes. This action must of necessity add largely to the value of all property and be beneficial to the State at large. As all the products of trade are derived from the products of the soil, from the expenditure of capital and labor in marketing the crop, and in handling it after being made so, a liberal yield and remunerative prices greatly increase legitimate margins, while sparse returns or prices barely removed from cost of production seriously affect the volume of business and reduce profits to a minimum. Collections have been very good, the general disposition of all being to reduce liabilities, and the percentage of bad or doubtful accounts is considerably smaller than usual. Having representatives in every portion of the State, we have been made thoroughly acquainted with every portion, and state with pleasure that the year has been a fairly prosperous one. A small section of the State suffered severely from freshets, but the area was so limited that the losses sustained, while very serious to those meeting them, did not materially affect the general prosperity. The completion of new lines of railroad and the construction of others has opened and will open additional territory, which will be vigorously canvassed and doubtless add considerably to the large trade already secured.

### Exports.

BY SHIP DELAINE, APRIL 15, 1889, FOR SYDNEY, N. S. W.

By Coombs, Crosby & Eddy.—48 dozen Axes, 40 dozen Edge Tools, 24 dozen Axes.  
By Healy & Earl.—8 cases Wood-Working Machinery, 3 packages Saws.  
By McLean Bros. & Rigg.—33 Lawn Mowers, 7 cases, 22 dozen Mouse Traps, 6 cases Door Hangers, &c., 1 dozen Scales, 2 packages Lampware, 6 Forges, 6 dozen Oil Stones, 11 dozen Bush Hooks, 22 dozen Locks, 14 gross Shade Rollers, 1/2 dozen Emery-Wheels, 1 dozen Boring Machines, 1000 Handles, 39 cases Sewing-Machines, 28 Store Truck 27 Pumps, 6 dozen Knobs, 3 dozen Picks.  
By V. Basanta.—9 dozen Sieves, 100 Clocks, 18 Clocks, 50 gross Paper Caps, 36 dozen Hammocks, 36 dozen Hoes, 42 dozen Wire Goods, 4 dozen Stepladders, 10 gross Blacking, 18 Wringers, 14 dozen Saws, 1 gross Lemon Squeezers, 20 gross Crayons, &c., 12 dozen Cow Bells, 6 dozen Grindstone Fittings, 10 Scales, 9 1/2 gross Lamp Goods.  
By R. W. Cameron & Co.—33 packages Buggies and Parts, 10 packages Buggies, 3 packages Hardware, 3 boxes Bolts and Nuts, 805 pounds Bolts and Nuts, 3 Wagon Jacks, 83 cases Handles, 6 cases Velocipedes and Wheels, 25,000 Slaters, 1 case Saddlery, 1 case Bells, 6 bundles Harness Dressing, 6 cases Saddlery, 8 cases Hubs, 15 crates Wheels, 5 bundles Harness Dressing, 1 case Harness Dressing, 1 bundle Rubber Bumpers, 1 case Saddlery.  
By Waterbury Clock Company.—2 packages Clocks, 2 cases Clocks, 10 cases Clocks.  
By Collins & Co.—137 dozen Edge Tools.  
By Frank Miller & Son.—4 gross Blacking.  
By J. L. Mott Iron Works.—1888 pounds Iron Stoves and Parts.  
By Welsh & Lea.—1 case Iron Bolts.  
By F. B. Wheeler & Co.—1/2 dozen Axes.  
By W. K. Freeman.—100 bundles Rims, 663 pounds Shellers, 1954 pounds Corn Mills.  
By E. K. Alburts.—35 dozen Axes, 5 gross Axle Grease, 1 case Tacks, 9 cases Hardware,

150,000 Primers, 12 Carriage Tops, 15 pairs Hubs.

By Strong & Trowbridge.—3 cases Pick Handles, 1 cask Lampware, 3 cases Bolts, 1 case Lamp Goods, 2 packages Tools, 50 bundles Wash-Boards, 1 case Saws.

By R. W. Forbes & Son.—13 packages Carriage-Ware, 60 gross Sewing-Machine Oil, 20 cases Sewing-Machines, 154 cases Sewing-Machines and Parts, 99 cases Sewing-Machines and Parts, 2 cases Sewing-Machines and Parts, 14 Die-Plates, 2 cases Horse Hoes, 15 packages Carriage-Ware.

By Mosbacher & Co.—15 1/2 gross Shears, 45 gallons Sewing-Machine Oil.

By Simpson, Hall, Miller & Co.—1757 pounds Plated-Ware.

By Edward Miller & Co.—7 boxes Lamp Goods.

By Manhattan Brass Company.—20 packages Lampware.

By Seth Thomas Clock Company.—168 Clocks.

By Recknagel & Co.—3 Washing Machines.

By W. & B. Douglass.—51 Pumps.

By Otto L. Patterson.—3000 pounds Cordage.

By Winchester Repeating Arms Company.—82 Guns, 40 sets Tools, 10,000 Metallic Cartridges, 20,000 Loaded Shells, 200,000 Primers, 25,000 Paper Shells, 23,000 Cartridges.

By H. W. Peabody & Co.—4 cases Fruit Presses, 1 dozen Wringers, 2 packages Stepladders, 6 dozen Sweepers, 6 cases Edge Tools, 22,400 pounds Barb Wire, 11,237 pounds Barb Wire, 2 cases Brushes, 10 cases Carbons, 2 crates Pumps, 10 cases Type-Writers, 1 crate Hardware, 18 gross Blacking, 5 packages Carriage-Ware, 240 pounds Bolts, 2 gross Grease, 12 dozen Brushes, 42 dozen Blacking, 20 cases Hardware.

By W. H. Crossman & Bro.—89 sets Axes, 2 cases Hardware, 2 cases Plow Parts, 1 1/2 dozen Clocks, 1 case Windmill Parts, 1 1/2 dozen Vises, 1 case Agricultural Implements, 2 boxes Oil Stones, 4 dozen Wringers, 2 dozen Wringers, 12 dozen Wash-Boards, 1 dozen Corn Shellers, 7 crates Carriage-Ware, 4 packages Pulley Blocks, 7 gross Tin Spoons, 6 cases Hardware, 30 cases Carriage-Ware, 7 dozen Dashers, 1 crate Carriage-Ware, 36 dozen Reflectors, 24 dozen Hoes, 28 cases Chimneys, 1 dozen Wringers, 9 cases Nails, 27 dozen Wash-Boards, 64 Castors, 2 1/2 dozen Cages, 5 cases Carriages, 4 dozen Hammers, 2 cases Hardware, 8 dozen Hoes, 8 dozen Hatchets, 288 Seats, 8 packages Pumps, 20 dozen Burners, 5 dozen Brushes, 4 cases Nails, 1 case Hardware, 3 crates Churns, 1 dozen Wringers, 36 cases Chimneys, 10 dozen Spades, 20 dozen Axes, 9 Refrigerators, 1/2 dozen Forges, 1 keg Staples, 3 packages Hardware, 2 gross Egg Beaters, 30 dozen Cages, 10 cases Hardware, 6 dozen Fruit Jars, 2 cases Hardware, 30 dozen Axes, 3 gross Handles, 24 dozen Wash-Boards, 3 cases Hardware, 3 packages Hardware, 16 cases Chimneys, 1 gross Brushes.

By A. Gintermann & Co.—5 cases Castings.

By A. Field & Co.—12 dozen Burners, 4 dozen Lamps, 2 1/2 dozen Plated-Ware, 100 Plated-Ware.

By Arkell & Douglas.—103 packages Carriage-Ware, 120 boxes Fruit Jars, 1 box Lampware, 9 cases Handles, 24 dozen Handles, 30 dozen Axle Grease, 2 cases Plated-Ware, 20 dozen Edge Tools, 6 dozen Saws, 4 gross Shade Rollers, 1 case Lamp Wicks, 17 packages Granite-Ware, 7 cases Lampware, 4 bundles Carriage-Ware, 4 packages Lamp Goods.

By Morris, Strouse & Co.—1 dozen Scales, 50 dozen Carpenters' Tools, 2 dozen Mallets, 5 gross Kitchen Tools, 2 1/2 gross Whisk Brooms.

PER BARK RUD. JOSEPHY, APRIL 18, 1889, FOR WELLINGTON, NEW ZEALAND.

By Arkell & Douglas.—12 dozen Traps, 1 dozen Meat Cutters, 8 cases Handles, 3 boxes Nails, 1 box Lead-Pencils, 1 dozen Ladders, 3 cases Saws, 6 dozen Edge Tools, 5 dozen Forks, 8 cases Hardware.

By R. W. Cameron & Co.—14 packages Agricultural Implements, 2 Buggies and Parts.

By H. W. Peabody & Co.—44,872 pounds Barb Wire, 2 cases Agricultural Implements, 2 cases Hardware, 132 cases Hardware, 1 case Firearms, 5 cases Hardware, 2 cases Pumps, 165 pounds Bolts, 3 cases Agricultural Implements, 2 cases Axes, 4 cases Hardware, 2 cases Agricultural Implements, 12 dozen Wash-Boards, 5 packages Agricultural Implements.

By Waterbury Clock Company.—8 cases Clocks.

By New Haven Clock Company.—1062 pounds Clocks.

By Edward Miller & Co.—6 packages Lamp Goods.

By W. H. Crossman & Bro.—3 cases Hardware, 37 dozen Axes, 116 dozen Handles, 1 box Hardware, 350 pounds Iron Bolts, 4 gross Shade Rollers, 1 box Hardware, 1650 pounds Horse Nails, 1350 pounds Horse Nails, 10 gross Lead-Pencils, 3 dozen Wringers, 1/2

dozen Scales, 3920 pounds Axle Grease, 1 1/2 dozen Hog Rings, 1 Tire Upsetter.

By R. W. Forbes & Son.—30 dozen Rakes, 1 dozen Mangles, 348 dozen Axe Handles, 3 packages Hardware, 4 cases Wringers, 18 packages Hardware, 17 packages Lawn Mowers, 2 boxes Wringers, 6 dozen Wrenches, 10 dozen Snaths, 15 dozen Hoes, 1 box Wringers, 18 dozen Adze Handles, 10 dozen Hammers, 1 case Seed Sowers, 12 boxes Oil Stoves, 5 1/2 dozen Axes, 1 case Hardware, 15 packages Hardware, 2 boxes Saws, 9 dozen Snaths, 11 dozen Forks, 12 dozen Hay Rakes, 4 packages Velocipedes, 6 dozen Perambulators, 3 packages Brass Goods, 3500 pounds Horse Nails, 1250 pounds Horse Nails, 1450 pounds Horse Nails.

By McLean Bros. & Rigg.—5 dozen Axes, 1 dozen Machine Oilers, 1 Washing Machine, 1 dozen Wringers, 3 gross Fruit Jars, 10 dozen Forks, 10 gross Lead-Pencils, 2 cases Bird Cages, 500 Handles, 3 cases Plumbs and Levels, 1 dozen Sinks, 13 sets Axes, 1 gross Shade Rollers, 30 Leather Dashers, 2 Boring Machines, 2 Lawn Sprinklers, 3 Drilling Machines, 5 dozen Broilers, 6 gross Sewing-Machine Oil, 21 Pistols, 4 dozen Forks, 2 Mangles, 4 dozen Wringers, 4 Lawn Mowers, 35 packages Nails, 2 dozen Sets Sad-Irons, 2 Bolt Clippers, 560 pounds Nails, 1 gross Egg Beaters, 5 dozen Lanterns, 7 dozen Braces, 2 dozen Razor Strops, 1 1/2 gross Snaps, 2 dozen Handles, 1 1/2 dozen Stone, 1 gross Axle Grease, 6 Stepladders, 10 dozen Mouse Traps, 4 racks Churns, 102 dozen Handles, 7 cases Augers, &c., 3 cases Cartridges, 11 Lawn Mowers, 5700 Metallic Cartridges, 2 cases Saws, 140 pounds Oil Stones, 3 cases Hardware, 18 dozen Axes, 3 gross Fruit Jars, 42 gross Wicks, 27 Stoves and 3 cases Parts, 24 cases Clothes Pins.

### FOR LYTTLETON.

By Orange Judd Company.—1 barrel Hardware.

By A. Field & Co.—2400 pounds Horse Nails.

By Samuel Lees & Co.—3 packages Wood-Working Machinery.

By Meriden Britannia Company.—1 box Plated-Ware, 1 box Plated-Ware.

By Arkell & Douglas.—60 dozen Handles, 2 dozen Axes, 6 gross Shade Rollers, 29 cases Hardware.

By R. W. Cameron & Co.—2 cases Horse Collars, 4 packages Dairy Goods, 41 dozen Axes, 15 dozen Axes, 25 dozen Axes, 50 dozen Axes, 250 cases Clothes-Pins, 10 dozen Whip Handles, 3 cases Ruling Machines, 30 packages Agricultural Implements, 88 dozen Handles, 12 dozen Locks, 125 pounds Horseshoe Nails, 2 1/2 dozen Churns, 12 cases Agricultural Implements, 131 packages Reaping Machinery, 25 bales Binder Twine.

By H. W. Peabody & Co.—22,428 pounds Barb Wire, 50 dozen Brooms, 32,052 pounds Barb Wire, 50 dozen Brooms, 20 dozen Machine Oil, 10 dozen Wash-Boards, 900 pounds Nails, 20 cases Stone, 1300 pounds Nails, 51 cases Hardware, 30 dozen Machine Oil, 2 Pumps, 4 cases Carriage-Ware, 1 case Agricultural Implements, 21 packages Lawn Mowers, 1 package Handles, 7 cases Tin-Ware, 2 cases Fiber-Ware, 1 case Bird Cages, 17 cases Lawn Mowers, 3 packages Agricultural Implements, 4 cases Hardware, 1 box Lampware, 1 crate Freezers, 2 packages Clocks, 53 packages Lawn Mowers, 13 packages Agricultural Implements, 16 packages Hardware, 700 pounds Nails, 3 Pumps, 1500 feet Hose, 12,815 pounds Barb Wire.

By R. W. Forbes & Son.—1 case Hardware, 2 cases Wringers, 1 case Towel Racks, 15 boxes Lawn Mowers, 2 boxes Toys, 13 packages Agricultural Implements, 2500 pounds Horse Nails, 6 boxes Wringers, 46 pounds Sash Cord, 1 case Wringers, 5 packages Churns, 1 box Sprinklers, 980 pounds Carriage Bolts, 30 dozen Brake Handles, 1 case Traps, 6 dozen Picks, 20 packages Wash-Boards, 1 case Store Trucks, 4 packages Oilers, 5 cases Apple Parers, 3 boxes Scales, 150 dozen Axe Handles, 17 packages Hardware, 2 packages Hardware, 3 cases Whips, 1 box Carriage Hardware, 3 packages Lampware, 4 packages Seed Sowers.

PER BARK PRINCESSEN, APRIL 24, 1889, FOR PORT ELIZABETH, SOUTH AFRICA.

By Coombs, Crosby & Eddy.—16,900 pounds Nails, 400 Plows, 7274 pounds Manila Rope, 24 dozen Axe Handles, 3 Hand-Carts, 1300 pounds Nails, 7450 pounds Sash Weights, 10 Meat Safes, 4 dozen Metal Goods, 3 Trucks.

By W. H. Crossman & Bro.—100 dozen Hatchets, 3070 pounds Rope, 1 box Hardware, 5 gross Stove Polish, 40 dozen Hatchets, 30 dozen Brooms.

By J. Norton & Sons.—42 pounds Castings, 100 dozen Pick Handles.

By Arkell & Douglas.—3 corn Mills, 3 cases Lampware, 6600 pounds Barb Wire.

By Goulds Mfg. Company.—1 case Farm Bells, 1 case Farm Bells.

By R. W. Forbes & Son.—30 dozen Shovels.

### Combination Folding Bath-Tub.

The New Combination Folding Bath-Tub Company, Marshall, Mich., are offering to the trade a sanitary specialty which we illustrate in the accompanying cuts. Fig. 1 shows the folding bath-tub as it appears when closed, while Fig. 2 shows it in position for use, revealing the water-tank

Fig. 1.—Bath-Tub Closed.

and heating arrangement. The apparatus combines water-supply, heating apparatus, bath-tub and waste-water exhaust in a very small space. The manufacturers allude especially to its convenience, as it does away with the necessity of having a hot-water supply in the building, and at the same time is a cheap, strong and durable apparatus. Furthermore, it is portable and can be placed in a furnished bedroom or other compartment, and when not in use presents the appearance of a cabinet. The two side-hinges that connect the top of the tub to the back of the heater, together with the two rollers on the bottom, permit an easy and partially automatic movement. The waste-water exhaust is, as will be

Fig. 2.—Bath-Tub Opened.

seen at the bottom of Fig. 1, so constructed as to connect and disconnect itself in folding and unfolding the tub. The heater, shown in Fig. 2, rests on galvanized-iron brackets and has a capacity for warming 25 gallons of water. Furthermore, it is arranged so as to let cold water circulate through the same to the tub, and can be

warmed in a few minutes with gas, gasoline or oil. The tub itself is made of heavy zinc or copper, while the cases are built of thoroughly seasoned wood and are tastefully finished.

### Hotel Coffee-Pot.

A novelty in coffee-pots is suggested by a correspondent of the *Metal Worker*, who writes to that paper as follows:

Coffee-pots have received their share of attention from inventors, and while the churn and farm-gate may be a few lengths ahead as regard numbers, the patented coffee-pots, if placed in a row, would make quite a showing. In Fig. 1 is shown the plan and elevation of a coffee-pot that has never been honored by a patent, so all of the readers of the *Metal Worker* are at liberty to construct as many as desired. This coffee-engine, as it might be called, is in-

Hotel Coffee-Pot.—Fig. 1.—Plan and Elevation.

tended for use in hotels and restaurants, and the advantages claimed for it are: The coffee when made is perfectly clear, and can be kept warm by the surrounding water for a long time; if placed on a hot stove the contents are not injured, as the coffee does not boil, and additional coffee can be made at any time without injuring that previously made. Referring to Fig. 1 it will be seen the

coffee pot is made double, similar to a water-cooler. The outer part A can be made 13 inches in diameter and any convenient height—say, 20 inches. As some water might be allowed to stand in A, it would be well to have a copper rim on the bottom, which would make the article about 22

inches high. The inside can B should be about 4 inches less in diameter and 2 inches shorter than A, as shown, the drawing being made to a scale of 1 inch to the foot. The strainer, or coffee-holder, C should extend above the top and within a convenient distance of the bottom of B. The bottom part of C at X is made smaller and perforated. A groove can be turned at Z, so that a flannel bag can be tied over the strainer X, to prevent any coffee-grounds from passing through.

Fig. 2.—Plan and Vertical Section of Plunger for Pump.

The weight S is a piece of tin punched full of small holes, to which a wire handle is soldered, which is used to prevent the coffee from rising up when the water is poured on. The pump D is made to slide through the hole in cover, shown by D in plan, and should extend to within about 2 inches of the bottom of A. This pump is made similar to those used on kerosene cans. In Fig. 2 are shown plan and elevation of the plunger; K K is a piece of turned wood, in shape something like a spool; L is the hole for the water to pass through; M a marble which acts as a valve; N two bent wires which pass through the spool as shown in plan and elevation, being secured by drops of solder applied at each end of the spool. To the two bent wires N is soldered the rod O, which connects with the pump handle. The groove P P is to be wound with candle wicking, which makes a good packing for hot water. The bottom valve can be made in a similar manner. This form of plunger was found to operate very well in hot water, though any kind can be used that will not impart a taste to or be injured by hot water. In elevation Fig. 1 F is a small float attached to the weight G by a chain passing from A to B through a bent tube, and as the coffee rises in B the weight is lowered, and by placing a gauge on the outside of the can the amount of coffee contained in B can be determined. The float and weight can be placed on either side of the front, so as to be out of the way, as shown on plan. The top of can is covered over and the edge of metal soldered to A, excepting the hinged cover E. The faucet H is connected with the inner can B in the usual manner.

In order to operate the coffee-pot, the space between A and B is filled with water, by means of a funnel, and the desired amount of pure ground coffee put in the

strainer X. This can be done in the evening when the coffee is intended for breakfast. The affair is placed on the stove, and after the water is boiling hot it is pumped into C and filtered through the ground coffee in X into the holder B, from whence it can be drawn as desired by means of the faucet. If more or stronger coffee is wanted the perforated cover S is removed and more ground coffee put in. In order to get all of the strength out of the grounds, the pump can be taken out, placed in B by putting the hole in cover shown at J in plan, when the coffee can be pumped through the grounds as long as desired. Only pure coffee should

The principal bearings have brass boxes, which are not affected by the acid of the fruit, and the point is made that as these brass boxes, which are simply drawn brass tubing, wear from the inside and give too much play, they can be replaced at a trifling expense, making the bearing good as new. In regard to the operation of this machine the following description may be of interest:

The bearing to which the paring, coring and slicing knife is attached is drawn toward the apple by the screw gear at the top, the paring-knife passing around the apple, taking off the paring, and the coring-knife being drawn through it. This is done by two turns of the crank, and the third turn, by a reverse motion,

*The Dandy Apple Parer, Corer and Slicer.*

be used for the purpose, as chicory will prevent the water from filtering through. In the plan and elevation similar letters refer to similar parts.

#### **The Dandy Apple Paring, Coring and Slicing Machine.**

This machine is designed especially for the use of evaporators, canners and bakers, and is manufactured by the Goodell Company, Antrim, N. H. The general construction is similar to the Eureka parer, which was brought out a few years ago, but it is a lighter and smaller machine, for hand use only. The point is made in regard to it that it is an exceptionally fast working machine, paring, coring and slicing an apple with three turns of the crank, instead of four, as in other machines. The paring, coring and slicing arrangement is the same as that used on the Eureka parer, the three knives being entirely separate and independent of each other. The machine can be used to simply pare or pare and core, or pare, core and slice, as the operator desires.

the carriage is thrown back in place for another apple to be put on, and the apple is taken off by the coring-knife and the core is pushed off by means of a rod which passes through the center of the fork spindle and is pushed off by a cam on the gear, striking a lever and pressing it forward toward the fork spindle or against the end of the push-off rod.

The company hold patents on the paring-knife, coring-knife and the fork used in the machine. The knife-head hangs on a swivel and is held up to the apple by means of a spiral spring. Thus there are two adjustments, which are referred to as allowing the paring-knife to get into the irregularities while it also takes a very thin paring, and it is so constructed that the paring will not clog in the knife-head. The patent fork is constructed of steel tines held in place by a brass ferrule, so that if one or more tines become damaged or broken, the broken tine can be removed and a new one substituted at a trifling expense. With this fork, which is smaller than the old style, a smaller coring-knife is used; two sizes of the latter being furnished, one  $\frac{1}{4}$  inch and the other  $\frac{3}{8}$  inch, to suit the requirements of all.

#### **The Victor Wardrobe Hook.**

The accompanying illustration represents this article, which is made by the Van Wagoner & Williams Company, 82

*The Victor Wardrobe Hook.*

Beekman street, New York. It is made, it will be observed, entirely of wire, the cut representing it full size. It is furnished coppered, japanned, tinned or in brass.

#### **Empire Automatic Cork Extractor.**

This article, patented April 16, 1889, is manufactured by the Empire Knife Company, West Winsted, Conn. Its form and

*Empire Automatic Cork Extractor.*

general construction are shown in the accompanying illustration. A spring in the head detaches the handle from the corkscrew rod, so that the corkscrew does not turn in the cork while pulling out, and the corkscrew can be set so as to turn any

distance into the cork, so that the cork need not be pierced through, thus saving it for use again. The power of this corkscrew is referred to as such that the hardest corks can be pulled with ease.

#### Elastic Hoop Wooden-Ware.

A line of goods manufactured by the Richmond Cedar Works, Richmond, Va., is illustrated in the accompanying cuts representing a pail and a tub with their elastic hoops. These goods are put on the market to meet the want of pails and

Fig. 1.—Elastic Hoop Pail.

tubs in which the hoops are not liable to get loose and the vessel to leak and fall apart. The elastic hoop is made of spring brass or spring steel and is run through corrugated rollers. Grooves are then cut around the buckets and the hoops are forced on and sprung into the grooves, each corrugation forming an independent spring, and the hoops expanding or contracting as the wood swells or shrinks. The hoops being elastic cannot break, and being in grooves

Fig. 2. Elastic Hoop Tub.

cannot fall off. This construction is referred to as giving a perfect vessel under all climatic or atmospheric conditions. The pails are made in white, red and striped cedar and highly polished, and the point is made that as there is no oil or other chemical put in this ware it is especially adapted for drinking and household purposes. The Richmond Cedar Works were recently awarded the medal of superiority at the Institute Fair, New York.

#### Paint Burner.

The National Sad Iron Company, St. Louis, Mo., are manufacturing a new paint burner, which is represented in the accompanying illustration. It works on

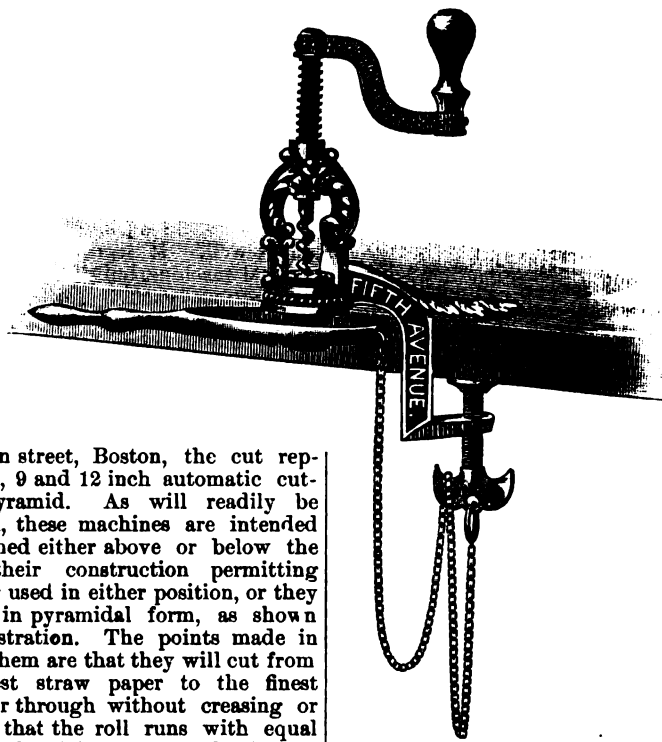

New Paint Burner.

the same principle as their well-known self-heating sad-iron. The advantages claimed for it are that it will make a hotter fire than other burners, is less trouble to handle and cannot explode.

The fact that it does much quicker work than others is also alluded to. It will burn three hours with one filling.

#### Automatic Roll-Paper Holder and Cutter.

This contrivance, which is represented in the accompanying illustration, is put on the market by Charles O. Danforth, 114

Washington street, Boston, the cut representing 6, 9 and 12 inch automatic cutters in pyramid. As will readily be understood, these machines are intended to be attached either above or below the counter, their construction permitting their being used in either position, or they can be put in pyramidal form, as shown in the illustration. The points made in regard to them are that they will cut from the heaviest straw paper to the finest tissue-paper through without creasing or wrinkling; that the roll runs with equal facility whether full or empty, having no springs or heavy knives to tighten the paper, the cutter or knife dropping as the roll decreases; that the paper is easily ad-

Automatic Cutters in Pyramid.—6, 9 and 12 Inch.

justed, being put in from the front, thereby saving trouble in moving should the machine be fastened on the end of counter or against the wall, and that they are especially durable, having no springs, saws, heavy cumbersome knives or complicated movements to get out of order. They are made in sizes ranging from 6 to 36 inch and are made of iron, nicked or

size paper is required for a parcel and removes the sheets and scraps from the counter, saving much of the room usually occupied, thus giving an economy in time, paper and space.

#### Fifth Avenue Cork Extractor.

This article, shown in the illustration, is put on the market by James D. Frary, Meriden, Conn., and is, it will be seen, a

Fifth Avenue Cork Extractor.

wire stripper and cork remover combined. It will readily be understood that in use the extractor is clamped to a shelf or table as shown in the cut, and the point of screw is inserted in the cork, the handle being turned until the cork is extracted, even though the spring is pressed quite down. It is claimed that it draws the hardest cork every time. The handle connected by chain is for stripping the wires from the bottles and removing the cork from the screw after it is drawn, and by means of it the cork may be removed from the screw without touching it with the fingers. The thumb-screw is made of a suitable shape to hang on the handle when not in use. This cork extractor is neatly finished, and is referred to as meeting a want for a family corkscrew, especially for ladies' use. The ease with which it works and its attractive appearance are points in regard to it which are emphasized.

A large steel pipe is about to be laid from Pittsburgh to the natural gas field in Murfreesville, the first one used for a similar purpose. This pipe will be 34,000 feet long, and it takes 2000 tons of  $\frac{1}{4}$ -inch steel to manufacture it. Cast-iron pipe lines are composed of 12-foot sections, while the sections of this pipe will be 24 feet long. This fact explains why it is that a great deal of labor is saved, because it takes about as many men to lower a 24-foot section into a trench as it would take to place a 12-foot section. Each section is similar in appearance and construction to a boiler, and there is no doubt it will do as good service.

The United States gun-boat Petrel has had her dock trial at the Columbian Iron Works, Baltimore, and her engines and machinery worked admirably. No date has been set for the official trial trip.

## Nails from Tin-Scrap.\*

BY OBERLIN SMITH, BRIDGETON, N. J.

It may surprise the learned metallurgists who read this paper to learn that, by a recent discovery, nails of good quality can be made at one operation, directly from the ore, at the rate of, say, 60 per minute for each operator. It should be stated, however, that the raw material referred to does not answer strictly the ordinary assayer's definition of an ore. It is found, in strata of various thickness, in Harlem, N. Y., and other localities where the *débris* from restaurants and from sheet-metal factories of various kinds has been dumped. In other words, it is old and new tin-scrap—one of the few substances which this generation, mainly occupied in exhausting the accumulated resources of the past, seems to have laid up, by way of atonement, for the benefit of posterity. In speaking of this material as ore we are simply looking forward, prophetically, to the time when our descendants may dig it up and write learned papers for the American Institute of Mining Engineers upon the best methods of assaying and smelting it.

At least such has seemed to be its destiny hitherto. It may fairly be said that the many attempts which have been made to utilize it by separating, through chemical or electrolytical processes, its two valuable constituents, metallic tin and first-class wrought-iron, have failed, either technically or commercially. The reasons for such failure need not here be discussed. Either the separation has been incomplete, the iron still retaining enough tin to spoil it for the sinking-fire, or other use short of remelting (perhaps even for that), or the manipulations of the process have been too expensive to make its results profitable—or both. Meanwhile the great tin-scrap deposits have gone on growing faster than any other strata of our post-tertiary, psychical era; given up by metallurgists, not yet attacked by geologists, and explored only by that mining engineer of the transitional period, Gulielmus Caper.

Before leaving these heaps of tin-scrap, however, to become mere mineral deposits for future ages, it may be well to consider a novel plan for their immediate utilization—novel not only in its means, but in its principle. For it undertakes to use this material just as it is, without trying to separate its constituents at all, and to use it, moreover, for a purpose in which the qualities of both these constituents—namely, the tensile strength and ductility of the iron and the resistance of the tin to corrosion—are directly employed with advantage. I refer to the manufacture, by mechanical pressure, of nails.

This nail was invented, in its original shape, by Mr. George H. Perkins, of Philadelphia, and has been developed, through various forms, until it has almost reached a commercial stage—the machine in which it is to be made in marketable shape being nearly completed. The writer has been associated with Mr. Perkins in its development, and can, perhaps, make interesting a brief description of the troubles we have gone through in order to produce it quickly, at one operation, in a reasonably manageable and durable machine. The first scheme tried was to cut "blanks" from ordinary tin-plate and sheet-iron scrap, of an approximately rectangular form, about  $\frac{1}{4}$  inch wide by  $1\frac{1}{4}$  inches long. This was done in an ordinary press. By a second operation it was corrugated in another press, with a special automatic die, which corrugated the middle grooves first and the side grooves afterward, much of the metal used not proving strong enough to stand the friction of being pulled into the corru-

gations of the die without cracking. At a third operation the embryo nail was crushed together, something after the manner of closing an accordion bellows. These headless nails were then fed by hand into a revolving dial, to carry them under a heading mechanism, after the operation of which they were ejected from the machine automatically.

Obviously, this series of separate operations made the nails far too expensive for the market, and, moreover, some trouble occurred from their splitting in the tightly-folded corrugations. We afterward built an automatic machine which performed all the above operations in succession, delivering a complete nail at each stroke. It was, however, far too complicated for practical use, and simply served to show what could not be done.

Our second nail-machine proper, constructed to receive blanks which had been already cut in an ordinary press, worked fairly well. It was likewise an experimental machine, built "piece-meal" and not strong enough for continual hard work, but it served this time to show what could be done. Instead of working upon the principle of regular corrugations it simply crushed up the blanks edgewise into any form which they chose to assume. The machine now under construction has been very much simplified and made enormously strong and heavy. It is adapted to cutting, crushing, gripping and heading the nails at one operation, and can be run as fast as an expert operator can feed the material. Its feed probably varies, with jagged, irregular scrap, from 30 to 90 nails per minute, although straight strips of sheet metal can easily be fed by hand into a machine running as high as 240 strokes per minute. During the course of our experiments various forms of nails have been tried. Among others were straight cylindrical nails with conical points; straight square nails with pyramidal and with wedge-shaped points; hexagonal nails, &c. The most practical form seems to be the square taper nail with about the same shape as the ordinary cut nail, but is somewhat stronger and a good deal tougher. It is well adapted for all ordinary purposes, but is especially suitable for a roofing nail, since the tin coating prevents much rusting and is good to solder to.

Among other processes we have tried winding the nail blank upon itself, after the manner of a window shade, but minus a mandrel. This, however, was difficult in execution, and was not found available in practice. The economy of this system of nail-making is obvious. The scrap can be bought for about 17 cents per 100 pounds, and a boy can make perhaps 100 pounds of nails per day. The most economical system of manufacture will probably be to run one or more nail machines at each large "tinshop," set as close as possible to the presses which produce the scrap, so as to avoid the expense of unnecessary handling and the extra tangling-up incident thereto.

Secretary Tracy has determined to give coil steam boilers a practical trial to test their value for use in large naval vessels. Secretary Whitney took the preliminary steps toward such a trial, and some manufacturers built boilers for the trial, but as the end of the Administration was drawing near the project was dropped. Coil boilers have proved very successful in small boats, but they have not yet passed the experimental state in large vessels, although the French Government has placed them in a number of war ships. Part of the steam-power for the armored coast-defense vessels is to be generated by this type of boiler. It will be a long time, however, before the boilers of the coast-defense vessel are tested, and in the mean-

time it is proposed to give these boilers a thorough test on land. The special advantages they possess over the old type of marine boilers are in economy of weight and space, two very important factors in the construction of a modern naval vessel.

The Cragin Mfg. Company, of Chicago, made a voluntary assignment to William A. Montgomery on the 1st inst. The assignee states that the liabilities are about \$70,000 and the assets from \$180,000 to \$150,000. The company had some paper overdue, and though none of the creditors were pressing their claims for payment, it was thought best to go into liquidation rather than to struggle along and perhaps dissipate the assets. They own a well-appointed factory at Cragin, in the vicinity of Chicago, and have been manufacturing sheet-iron ware, possessing valuable patents on machinery for the manufacture of coal-hods, dripping-pans, &c. The works were established by Cragin Bros. & Chandler. In 1888 the Cragin Mfg. Company were organized with a capital of \$120,000. The stock was mainly owned by the president, W. P. Cragin, and the Dudley Estate. It is expected that a considerable sum will be realized for the stockholders after all the claims against the company have been fully paid.

# CURRENT HARDWARE PRICES.

MAY 8, 1889.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.
